A good many of you have had more or less experience in trapping skunks and know that about the best way to catch them is to set a trap at the mouth of their den, no bait being necessary. Set the trap just inside the entrance with the jaws set lengthwise of the hole. You do not need to be very careful about covering the trap, and as we just said bait is not necessary. However, it is not at all a bad idea to put a small piece of tainted meat just inside the den entrance. If you don't find a den, dig a hole under an old stump, put a bait inside, and set your trap directly in front, covered with loose dirt.

So much for the actual trapping. The next thing is taking care of him after he is caught. This is a job that most of us do not fancy although, if properly done, it need not prove so very unpleasant.

When your trap is staked, approach it slowly, carrying a good, strong, 6 foot club ready to strike. Advance slowly avoiding any sudden movements. If the skunk starts to raise its tail as if to throw its scent, stand still until it drops it again, then continue to walk slowly towards it until within striking distance. A quick, hard, blow to break its back will finish things nicely. Another good way to kill a trapped skunk is to shoot it in the middle of the back with a 22 rifle.

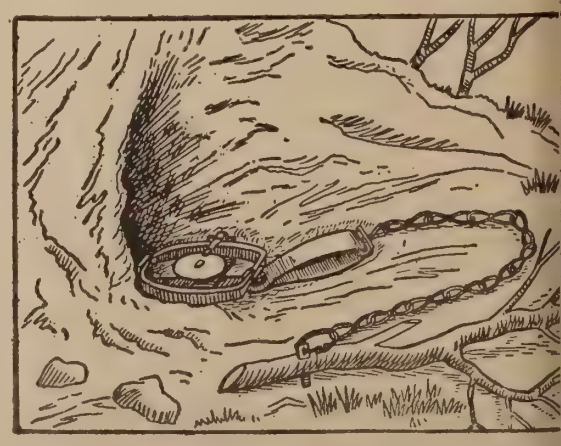
If the fur of the skunk does become scented Kreps advises smoking it to remove the disagreeable odor. He suggests building a small brush fire and throwing on an armful of evergreen boughs to make a dense smoke. If you hold the animal in the smoke for about five minutes, being careful not to singe its hair, most of the undesirable scent will be gone.

Handling Furs

You haven't finished your job after you have caught an animal. In fact, the actual work has only just begun. The trapping part is, for the average fe"ow, good fun; handling the fur is more like work. It is, however, very necessary that you do this work well, else you might better never have started trapping at all. A good fur badly removed and poorly dried or cured is worth less on the market than a poorer fur, well handled.

In this connection we cannot give you better directions than to quote from Mr. Kreps' book which we have previously referred to:

"There are two ways of skinning fur-bearing animals, namely, 'casing' and skinning 'open'. The weasel, mink, marten, fisher, fox, opossum, muskrat, civet, skunk, and wild cat should be cased.



"To remove a skin by this plan, cut it loose around the feet and rip down the back of the hind legs, to and around the vent. Peel the skin carefully from the hind legs and skin the tail by slipping a split stick over the bone, when by gripping the stick with the right hand with the bone of the tail between the second and third fingers and holding the animal with the left hand, the skin may be stripped off easily. Draw the skin downward from the body keeping it as clean of flesh and fat as possible. To facilitate this process the animal may be suspended from the limb of a tree or other projection by looping a strong cord around the hind legs after they have been skinned. The skin should be drawn from the front legs and when the ears are reached they should be cut off, cutting downward toward the head. The skin should be cut loose around the eyes and nose and it will then be in the form of a long pocket, fur side in."

In the case of the muskrat, of course, the tail need not be skinned.

After the skin is removed clean it of all burs, mud, or blood. The next thing is to flesh it, that is, remove the flesh and fat that may have been left on the inside after skinning. For this purpose have a tapering board with the edges smooth and slightly rounded. Draw the skin over it, flesh side out, and scrape the flesh and fat off with a blunt instrument such as a hatchet. Be very careful not to damage the skin in any way in doing this.

The next thing is to stretch the fur. For this purpose you need stretching boards similar to those shown in the illustration. These particular ones are the Canadian pattern and most of them you will note are in three pieces. Some trappers use one piece boards similar to that one for muskrats. Use some soft wood to make yours. The lumber from an old dry-goods box will do very well, but whatever you use, be sure to plane it smooth. For mink make the boards 2 to 3 feet long and 3 to 4½ inches wide; for skunk let the board be about 6 inches wide at the shoulder and 7 inches at the base, and about 30 inches long. For muskrat make them about 2 feet long, 5 to 6 inches wide at the base, and about 4½ inches wide at the shoulder.

Stretch the skin flesh side out as soon as they are fleshed. Let them dry in a cool, airy place, and as soon as dry enough to prevent wrinkling or stretching, take them down.

TRAP SET IN CORRECT POSITION AT ENTRANCE DEN, JAWS LENGTHWISE.—(From Science of Trappi A. R. Harding, St. Louis, Publisher.)

The next thing, and a very im tant one, is to sell them. Write to or more large fur houses and t will not only quote you prices, but request will, no doubt, give you di tions as to how to pack your furs shipment.

When to trap

Just when should you begin y trapping? First of all that depe upon the trapping laws of your state, a copy of which you can ea get from your state capitol. The r consideration is the condition of fur. Don't start too early in the son when the fur is not of good n ketable quality. It simply mean waste for which there is no exc

Skunk furs are prime in the no ern states toward the end of Octo farther south, toward the end of vember. They depreciate about middle of March.

Mink is best during November the end of January in the north in December and January in south. During February the fur gins to depreciate.

Muskrat is fair in the fall w trapping is the easiest. The best however, is taken in the period f midwinter to March. A good co tion may be expected in the north to about June first and to April in the south, but in some states least, game laws prohibit trapp so late in the season.

Opossum in the north becomes p toward the middle of November remains good until March. In south it is at its best from Decem to February.

If you are after raccoon in north states, you will find the fur p about November first and in the s a little later.

Fox is usually prime in north territory from the first of Noven until the middle of March. For south the latter part of Novembe the middle of March brings the furs.

Make Your Fun Pay a Pro

All summer you were busy e helping your father or with own work,—in most cases both. this season and until next spr school will claim a good deal of time and in addition, of co chores always have to be done m ing and evening. But even most fellows can find time for a l fun.

Now, for a good many of you t is a way to make your good time you a profit. Almost every fe

s to trap and practically every or dairyman has had some expece along that line. Last winter e a number of juniors made their s earn at least part of their ding money and some did even er than that.

ne nice thing about trapping is you don't need to spend much ey in getting started. A few good s, some stretching frames, and a wledge of fur bearing animals how to handle furs will start you very nicely. The first, if you do already have them, can be purased from the nearest hardware e for from 25 or 30 cents to 75 s each; the second you can buy or e yourself; and the third you can ly get by doing some interesting ling and by using your eyes.

loreover, in practically every lo- ty you will find some animals se fur is marketable at a good e, a particularly good one this son when all kinds of furs are ing high. Those who have done e trapping before will no doubt be again this winter and if you never e tried it, do so, and you may be prised at the good results you e.

Junior Letters

oard's Dairyman Juniors:—I have been busy and neglected to write to you for a time. We are now filling silo. We had 40 s of corn and will have a good deal left from the silo. I go to school most of the but the schools are closed on account of Spanish Influenza. I am in the third year school now.

e had about 60 acres of grain and have two settings yet to thresh and have shed one setting. We have about 150 head attle. My heifer and calf are doing nicely. e have 78 pigs and we will sell them in t a month. We will butcher 6 or 8 of them I think we will kill a beef.

isconsin. Hayden Simmons.

oard's Dairyman Juniors:—I received your r some time ago. Our high school started it 4 weeks ago. I like to go to high school well. This week we have no school be- e the grippe has attacked a great many le in Monroe. I hope I can go to school n next week. I take up four studies now: bra, English, Civic Biology, and Domestic nce.

ast week we filled our silo the last time. brother, our friend, and I were in the silo afternoon and it certainly kept us busy. ay we filled a silo for our neighbor. Our filler works fine, so does the tractor. er is very busy every day. We have nearll our corn cut. It is very dry around here. haven't had a good rain for the last 2 ths; it rained about 30 minutes here to-

ur cows have had nothing to eat in the ure for a long time. We have been feeding or less all summer; we are now feeding fa hay and silage.

e will soon have the electric lights ready use. The house is wired and most of the tres put in place, but the plant is not here I can hardly wait until it comes. We going to have it in the barn, house, horse , granary, and silo.

e have a cow that has freshened the sectime and does not give more milk than of the heifers. She is fleshy and in the ning is sometimes bloated to a small ex- and she doesn't get any more feed than of the other cows. Papa is planning to or butcher her. If our yearlings turn out we will have plenty of cows without her.

isconsin. Emma Haef.

oard's Dairyman Juniors:—I have not ten to you since last spring. I milk a cow y night and morning. We now have ten , 6 heifers, and 1 bull. My brother and I a pure-bred heifer which my father gave We have not dug our potatoes yet or cut corn. We had about 35 tons of hay this about 15 tons less than last year. Our are doing fine. We feed them 7 quarts of feed meal a day. I am going to trap for ks next month. I read the junior page y week and think it great.

assachusetts. Frank Joslin.

oard's Dairyman Juniors—We have got 32 pigs. The first litter is learning to eat We feed them separated milk with a pail round barley and oats. My heifer is fine in good condition. I sent an exhibit to the and got second prize on cabbage. It is dry out here but we are getting rain now. pe the pasture starts to grow again. We milking three cows now. They give 70 lbs. y.

ashington. Alfred Gastineoo.

oard's Dairyman Juniors:—My heifer is ing nice and big. She will have a calf in mber. My brother has a camera and he took a picture of it and me and I will send you one of them if it got all right.

We just finished sowing wheat; we put in about 40 acres.

I have a brother in the army. He has been in the army for 6 months and likes it all right. Well, I guess I will quit for this time, wishing the juniors good luck. If the juniors want to write to me my address is Barnett, Ill., R. R. 1. Arnold Fonke.

Hoard's Dairyman Juniors:—I received your letter some time ago but haven't had time to write until now. You ask what kind of pasture our pigs were running on. It has six different kinds of grass that father seeded last spring. My brother's name is Paul. Paul and I sold our pigs. We got 16c a pound for them. My pig brought $15.20 and Paul's pig brought $14.40. You ask if our colt is a driver. It is a saddler, trotter, and Percheron. It will be a good driver when it gets older. You also ask if Paul and I tested our corn. We tested all the corn that we planted on our farm. The drouth injured the corn very much here. In some places the corn burned up. Paul and I sold our corn for $11.25. I own one war saving stamp and am going to get one more. I am gathering walnuts, hickory nuts, and peach seeds for the Red Cross. The walnut trees around here are loaded with walnuts. I am going to buy a sheep with my pig money. I live on an 80-acre farm 1¼ miles from a brick school house. I am 10 years old and am in the sixth grade. The state superintendent shut down the schools on account of the influenza. Wishing the juniors good luck.

Missouri. Wayne Doughty.

Big Increase in Porcelain Efficiency

Half Again as Much Resistance to Current When Heated

In the hign-speed, high-compression motors of today spark plugs must work in heat undreamed of a short time ago.

Yet under intense heat the porcelain insulator that once worked perfectly, actually becomes a conductor of the electric current—fails to supply the explosive spark.

But science has now more than kept pace.

Experiment 3450 in the tenth year of unremitting original research work in our porcelain laboratories has produced a porcelain with half again as much resistance to current when heated.

Champion Dependability takes so long a step forward that it seems well nigh inconceivable that any future motor will ever again develop heat enough to threaten short-circuiting through the porcelain insulator.

This greater dependability is yours if you merely take the pains to see that "Champion" *is on the porcelain* of your spark plugs as well as on the box.

There is a Champion Spark Plug for every type of motor car, motor truck, tractor, motorcycle and stationary engine.

Champion Spark Plug Company, Toledo, Ohio

Champion Spark Plug Company of Canada, Limited, Windsor, Ontario

The Plowing Contest

he plowing contest which is the occasion of the year with our ch friends is slowly coming into r in this country, and the locali- where contests have been held so well pleased with them that are invariably repeating them y year.

et us look for a moment at a typi- Scotch plowing contest, and see if sn't something we can copy more rersally and profit generally there- Imagine a crisp October day, a typical of our Indian summer s, and by early forenoon the peo- from all the countryside for s around begin to gather decked in holiday attire, for the plowing est is one of the most important, ot the most important occasion of year for the farmers.

he magnificent teams of Clydes all groomed immaculately and be- ed with roses and ribbons. The her of the harness glistens, and s polished over the oil, and the intings are burnished until they as bright as mirrors, for prizes offered for the best groomed ns and the best kept harness. The ns have been trained for days, sibly weeks, for the event.

he plows are all most carefully rpened and scoured, and each con- ant has tried out his plow and t carefully adjusted it prior to day of the contest, for he knows t it is impossible to do even a fair of plowing unless the plow is very efully set and adjusted to the m, and no adjusting is allowed ing the contest.

here is a great deal of friendly alry and joshing among contest- s and especially among the help- ers and the crowd, much inspecting and discussion of plows as to whether there is enough "suck" for this particular land and whether the coulter will cut a clean furrow through the turf, sod being invariably used for plowing contests.

The plowmen, frequently as many as thirty of them, all line up at the ends of their various one-half acre plots and at a signal the contest is on, in a way like a race, yet a very slow one, for the making of the back furrow which consists of two very shallow three cornered furrows turned with their lower corners just meeting, is a most particular job and an art that is not learned in a day or a month. As a matter of fact, before a man can pass as a plowman in Scotland he must serve an apprenticeship at the job. There are cries of "Hold on there, Jock, hold in to the left a wee bit", from the helpers who stand at the end of the furrows and keep a sharp lookout for the least bit of a curve in the line of furrow. The helper also takes the plow and team at one end and drives across the end to rest the plowman and give him an opportunity to see the work of the others. The work is quite tiresome for the plowman walks or rather hops along with one foot in the furrow and one up on the land, braced against any swerving of the plow, and his eye never leaves the end of the furrow ahead of him. The result of all this work is a job of plowing that is a sight to see. The furrow is usually about 7 or 8 inches wide, instead of 12 or 14 inches as in this country, by 6 or 7 inches deep. The line of the furows stick straight up as square be stretched, and the corners of the furrows stick straight up as a square and true as if molded in clay, with not a break from one end to the other, truly the work of a master plowman.

A medal is usually given to the winner and several smaller prizes, commonly cash, are given to the next in rank along with prizes to the best groomed teams and the best cared for harness.

The good fellowship and friendly rivalry brought out by the plowing contest is something that any community will be better for, and occasions when the farmer can come out and demonstrate his ability as a master workman, for master workman he undoubtedly is, are few and far between.

The writer had the good fortune to be present recently at the 5th annual Taylor County, Wisconsin, Plowing Contest, and the interest shown by those people up in that great new country that is just being cleared, was a sure indication of the good that is sure to come from the plowing contest.

R. A. Kolb, the county agent, who inaugurated the plowing contest in Taylor county, has also combined with it a small, strictly agricultural fair, and plans to have brief talks on timely subjects such as cultural methods for some crop that may have given trouble that particular season; a talk on soils by one of the Experiment Station men who is particularly well acquainted with the types of soil in that country, or other subjects as seem advisable.

There were seven contestants in the Taylor County, Wisconsin, Plowing Contest this year. The first prize was won by Wm. Kapszukiewicz, and the second by Louis Fortin. The prizes given at the Taylor County Plowing Contest are usually live stock or farm implements. This year a pure-bred Holstein bull, donated by the bankers of the county, was given as a first prize, and a Tamworth boar for a second prize, with pieces of farm machinery for other prizes. The giving of such prizes as these is to be recommended over cash prizes as they help in a very real way in building up the live stock of the community which, together with the rivalry and good fellowship of the contest, makes it an occasion long to be remembered.—F. W. DUFFEE.

Cattle and sheep in Scotland remained practically unchanged in number last June compared with June, 1917, according to the agricultural returns, but swine declined 4 per cent on account of diminished feeding stuffs.

J. M. Evvard, head of the Swine Experimental work at Ames, Iowa, has conducted some of the most extensive and practical hog experiments in the country. Some of his recent practical suggestions regarding fall pigs are as follows:

Feed both sow and litter well from the start to build flesh for winter.

Give plenty of good water and warm it in the winter time.

Keep fall pigs in warm, ventilated house.

Keep houses well bedded. This means bedding must be changed fairly often.

Place self-feeders within house so pigs will not have to go out in the cold to eat.

Confine pigs in small quarters and do not allow them to run over the farm.

Keep pigs free from lice, mange, and worms. Crude oil is good to prevent mange and kill lice. Santonin will get the worms. Give constant and careful attention to pigs.

(U. S. OFFICIAL WAR FILMS)

President Wilson says:

(in a letter written from the White House under date of September 16th)

"It was one of the most remarkable and one of the most satisfactory portrayals that we had seen of the great task which America has performed with such enthusiasm and in a fashion which cannot leave the results in doubt."

You have *read* about the war. You have *thought* about the war—and *talked* about it. You have cheered the boys who left your town to serve Uncle Sam.

Now you are going to *see* the war—as clearly as if you were over there yourself. You are going to understand America's part in the war, as no amount of reading, thinking, talking or cheering can possibly make you understand it!

"America's Answer" takes you right into the heart of the world conflict, and shows you how these American boys, we are so proud of, are helping to wipe out the cruel canker that is eating into the vitals of mankind.

The war becomes a real issue—the "official reports" in the newspapers are suddenly translated into actions that lift you bodily from your seat and make you cheer yourself hoarse.

You women who have men folks in France will specially welcome this opportunity to see "America's Answer." A Washington woman spoke for all the women of this nation when she said, "If they only would stop long enough for one to scan the faces, I feel sure that I would see my boy."

"America's Answer" is the greatest war picture ever shown on the screen. You can't afford to miss it.

California Dairy Adjustments

(Continued from first page.)

duction takes place in feed and la costs, or a higher price is forthc ing for their product. I have noted that many dairymen enough elasticity in their organi tion to provide ways for self pre vation. One or two of the more standing instances are of value showing what the exercise of matter can do.

Same Feed to Fewer Cows Increa Production

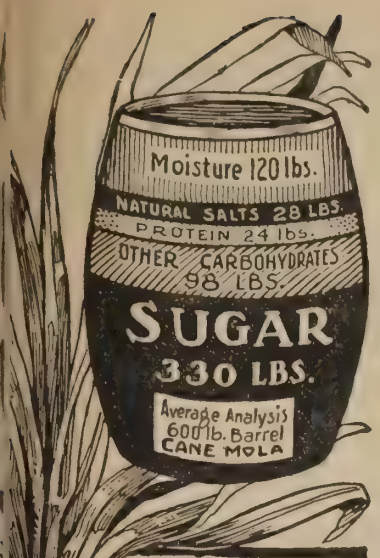
William F. Lagrange is manage 20,000 acres of hay, grain, and crops. He is running 1,200 d cows. As this ranch is primarily cerned in producing war essentia asked Mr. Lagrange how the was affecting his business.

"Our biggest trouble," he said, loss of our best tenants by the dr Ranch help has been heavily dr upon in our district and we forced to reorganize our business

Asking him as to how he inter to reorganize, Mr. Lagrange plained:

"Well, for one thing I am plan on cutting each tenant down to string of cows. This will cut us f a total of 1,200 to 800, and will la ly make up for our loss of labor.

"Moreover, we shall weed out tubercular and boarder cows, s thing we ought to have done a time ago, so that the total profits not be reduced a cent."



This naturally raised the ques "That's all right from the standp of the company's pocketbook, but about reduction of total output, s thing rather important to the cou as a whole?" The reply was: " matter of fact, we won't cut d production at all. I find that by ducing the number of cows my will go farther and I shall have concentrates per cow, both of w will increase the production per to a point so my total will be wh is now, especially as we plan t into the whole milk market ins of selling butterfat and feeding skimmilk to the hogs."

Tractors Release Feed for Co

Tractors are going in on e hand. In some cases mistakes ar ing made in the choice of the type or the right size of tractor, even in buying a tractor at all, b the whole, substitution of machi is along sane and logical lines. man has bought a small tracto plow all the grain, carrots, beets, and corn lands for his tenants, of whom he has a large ber, leaving nothing but the see cultivation, and harvest to be by his tenants. He charges a flat for plowing. He figures that tractor in plowing and doing heavy work on 1,200 acres does with about fifteen horses. The formerly consumed by this work will admit an equal number of tional cows to his dairies, and th increase the output of food prod

J. A. Sullivan has partly over the difficulty and high cost atte the getting of milkers by cullin herd more closely and utilizing less profitable cows as mothers beef calves. By visiting neighb dairies he picked calves at $5 them on these cows, later fini the calves on roughage, alfalfa ture, and hay. He makes pro his calves sufficient to pay hi continuing to keep the cows, wh normal times will pay for their and keep, and a reasonable prof sides; but during times of high and costly labor these cows c justify themselves in the mi string.

Fred Howard has rearrange feeding scheme to pasture his

Sweeten Up Your Roughage!

Stock Will Greedily Eat It.

For economy's sake use Cane Mola, a pure 100% sugar-cane molasses, on straw, corn stover, old hay, etc., or mix it with grain. It improves appetite—aids digestion. Dry, untempting food becomes appetizing and pleasing to taste. Besides the food value of Cane Mola in itself is exceedingly high—in fact, superior to corn.

CANE MOLA

makes all kinds of home grown coarse feeds palatable and desirable. The sugar and natural salt mean rapid, healthier growth of stock. Cows yield 15 to 25% more milk.

Feeding Costs Reduced to a Minimum

Practice real conservation. Don't give your stock expensive prepared feeds. Keep your animals in prime condition always. No digestive disturbances — no colic. Use plenty of Cane Mola—you can afford to, and the results will be highly satisfying. Endorsed by government experiment stations.

Cane Mola is sold in 600-lb. barrels, or smaller sizes if desired. Tell us what roughage you have available. We will send you our booklet and expert advice on economical feeding. Write us today.

Pure Cane Molasses Corporation
69-A Wall St., New York City.

Distributors in Milwaukee, Chicago, Cedar Rapids, Des Moines, Omaha, Philadelphia.

more closely and in rotation, with a view to permitting some natural reseeding to take place. His plan is to rebuild his resources in the way of natural feed. When pasturing he feeds down very closely to force the cattle to eat up everything, and especially the weeds, so that these cannot reseed to the exclusion of better feeds. By holding off stock from a portion of his range until the feed is mature and then pasturing heavily, he gives all plants a chance to seed. The tramping of the cattle covers the seed. This system involves fencing, as fields must be available to provide feed during the early growing season, at the optimum time of growth (when the plants are in blossom), and when the plants have completed seeding; while one portion is left entirely without stock—a self-seeding reserve and absolute seed proposition pure and simple.

Domingo Grossi and His Milker

Of all the attempts to conserve labor the case of Domingo Grossi is hard to beat. It is of interest because it is an outstanding example; it is not a prescription for wide application. Mr. Grossi prior to Feb. 24th hired 5 milkers to care for his herd of about 100 milking animals. On that day he put in three double-unit milking machines. Since then his daughter, a buxom lass of 15, has with the machines handled all the milking, 3:30 a. m. and 3:30 p. m., day in and day out. The stripping is done by Mr. Grossi and six brothers and sisters all younger than Miss Grossi. The seventh child—a 2-year-old, has not taken hold as yet, although the 4-year-old takes his turn with the others. It is some sight to see this little tad almost buried from view under the flanks of a brindle cow! I might add that no coercion is practiced—the children take to dairying as ducklings to water. It's typical of the Swiss. Only one hired man is now retained. I doubt if this example can be duplicated in California or elsewhere; as most hired operators will only handle 60 cows, it is evident that Miss Grossi is easily replacing $100 worth of man power. Twenty-seven of Grossi's neighbors have lately put in the same machine. Even the Portugese and Swiss have turned to them to aid in meeting a difficult situation.

Barrenness

One of our tenants has a Holstein heifer, two years old, that does not breed and he thinks she is going to be barren. What can you suggest?

Knoxville, Ill. I. J. L.

There is no certain remedy for barrenness, as the causes are many and different. The contagious abortion disease is the most common cause. On general principles it would be well to have a trained veterinarian massage the ovaries a few times by way of the rectum. This should be done once a week and its purpose is to break down cysts, sometimes the cause of barrenness. He may also have to treat the womb. Meanwhile inject into the vagina two or three times a week lukewarm water containing a heaping teaspoonful of pure phosphate of soda to the quart.

About 24 per cent of the entire hay crop is baled, it is estimated by the crop reporters of the Bureau of Crop Estimates. It is expected that 18,600,000 bales of cultivated hay and 2,488,000 bales of wild hay will be baled from this year's crop.

120 GRADE HOLSTEINS 120

will be sold

December 5th, '18

At Brighton, Ill.

The Sale Will Include 40 Aged Cows

some of them with calves by side and practically all of them heavy in calf.

40 Heavy Springers—
carrying their second to fourth calves.

20 Heifers—
heavy in calf to good pure-bred bulls.

20 Open Heifers—
short yearlings.

In addition two very good pure-bred bulls will be sold. Both of them are ready for heavy service, one of them 2 years old, the other nearly two. Both are rich in the blood of King Segis and Homestead Jr. De Kol.

REMEMBER—These cows are all thrifty, high grades. Most of them have been chosen from the best dairy herds of New York and Wisconsin. All are bred to good registered bulls.

This is an exceptional opportunity to buy good ones and at your own price.

For further information, write

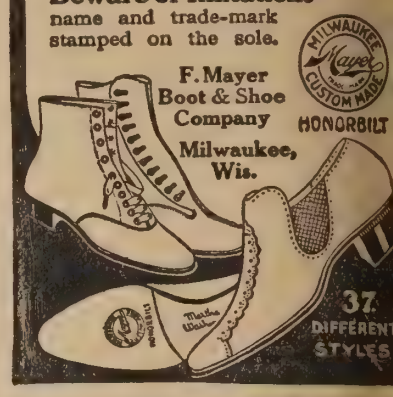
Os. HANOLD, Brighton, Ill.

Brighton is on the Chicago & Alton R. R. and on the C. B. & Q., 40 miles from St. Louis and 60 miles from Springfield, Ill.

Fattening Hogs

HOARD'S DAIRYMAN:—In putting fat on a hog one day's poor feeding will more than offset two days of good feeding. Corn is a mighty fine feed for the purpose of fat making but it is a mistake to rely wholly upon it. I have known some to feed their hogs entirely on corn and after a while the animals were "burned out" and not gaining a bit. Their appetite and digestion were impaired and the animals came to a "standstill" and it was a good while before they overcame the backset. Corn is one of our best fattening feeds; in fact, we may consider it the best, but unless we feed it as we should we are not going to get the best results from it. When hogs have not been used to corn at every feed or have not had any for a long time it should be fed in small quantities at first, gradually increasing the amount as the animals become used to it until they are on full feed.

I never feed my hogs very much corn until about four weeks before they are to be slaughtered. Then I keep corn before them all the time and in addition I supply them with mill feeds, alfalfa, and clover hay steamed until tender, turnips, artichokes, peas, and, in fact, any kinds of foods that will put fat on them and make wholesome meat. A variety of feed will put fat on a hog more quickly and cheaply than any single kind. It does not take long to fatten a hog if it is given a variety of wholesome feeds and the meat is well streaked. juicy, and tender and weighs well in the scale.



The cost of meat depends upon the cost of the feed consumed by the hogs. Anything that cheapens the cost of the feed makes the meat cost less if it is not done at the expense of the health of the animals. No one who wants to put fat on the hog at the least expense and in the shortest time is going to compel the animal to stand in a pen with his feet six inches deep in mud and filth. Clean pens and clean surroundings are too important to be neglected. I give my hogs a good deal of skimmilk and buttermilk in the sloppy portion of their ration. I know there is no better or cheaper feed than such milk, but no matter if the animals do get plenty of milk they want clear water to drink just the same. Three times a day I give my hogs all the clear water they will drink at each time and when the weather is cold I warm the water enough to take the chill off before giving it to them. I also warm the sloppy portion of their feed in cold weather. Warming the water and the feed is a little trouble, but I am sure it pays to do so. Charcoal, ashes, and salt help to keep the hogs in a good, thrifty condition, and then they make better gains. My plan is to mix a quantity of these and keep the mixture before the animals all the time. Every fall every farmer should fatten enough hogs to supply the family with meat and lard for a year. These products can be grown much cheaper than they can be purchased from the butcher or the merchant.

How About a Herd Sire?

MUTUAL FOBES LONGFIELD DEKOL 82959
A Splendid Son of His For Sale.

The Calf—M. M. Tritomia Fobes Longfield was born Feb. 2, 1918. He is nearly white, as straight as a line, and very well grown.

His Sire—Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters and a large number of younger ones coming on that will be retained in our herd. His sire is one of the good sons of Mooie Mutual DeKol and his dam, a daughter of Homestead Jr. DeKol, made 30.04 lbs. butter, 630.80 lbs. milk in 7 days as a jr. 3-yr.-old; 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days. (World's record when made).

The Dam, Milford Tritomia Fobes Homestead, a daughter of Canary Fobes Bessie Homestead, made 17.35 lbs. butter, 358.2 lbs. milk as a jr. 3-yr.-old; the second dam 17.38 lbs. butter, 408.3 lbs. milk; third dam 22.19 lbs. butter, 488.40 lbs. milk.

This is an excellent combination of breeding, the sire of this youngster and his dam's sire both being from daughters of Homestead Jr. DeKol, both with records above 30 lbs. butter and 600 lbs. milk.

The calf is priced within reach of any small breeder. Write us today for complete information about him.

MILFORD MEADOW'S STOCK FARM, Lake Mills, Wis.

A Bull That Will Suit You

He's sired by Dutchland Colantha Belle Boy whose dam is a 27.5-lb. 3-year-old daughter of Hengerveld De Kol, whose sire is the great Colantha Johanna Lad. His dam is Johanna Theresa 2d, a granddaughter of Sir Johanna Col. She made 21.68 lbs. butter in 7 days, and 782 lbs. butter, 18,600 lbs. milk in 1 year. Moreover she's a show —took first as a 4-year-old at the 1911 National Dairy Show. This youngster, just a little over 6 months old, is ed by short and long time records. Individually he's a dandy, nearly half white, just the kind you've been ng for. Other young bulls by the same sire and from A. R. O. dams for sale. Write

Holsteins In America

The Holstein-Friesian breed of dairy cattle has been established in this country nearly 50 years and has made good from the Atlantic to the Pacific. The breed has been used to improve the dairy qualities of the cattle of Europe. It is in demand also in Canada, Mexico, Australia, New Zealand, South Africa, Japan, Argentine, Central America, and other countries, and holds all records for largest yield of milk and butter. They are large, strong, vigorous, prolific, and productive cattle, and succeed under all climates and conditions.

If interested in **HOLSTEIN CATTLE** Send for our booklets—they contain much valuable information.

Sir Inka Prilly Segis Albino

Born Dec. 3rd, 1917.

A Real Bull For Some Small Breeder.

IF YOU ARE A SMALL BREEDER or beginner in the Holstein business and in the market for a herd sire, here is one that is worthy of your best consideration.

JUST A YEAR OLD—Ready for service. He is well grown, a splendid individual with faultless topline and marked nearly all white. As an individual he will suit the most particular.

SIR INKA PRILLY SEGIS, his sire, is one of the famous sons of the great King Segis, who has proved himself to be one of the greatest, if not the greatest, transmitting sires of the breed.

THE DAM OF SIR INKA PRILLY SEGIS is Inka Prilly with a record of 30 lbs. in 7 days. She is from a 25-lb. daughter of old Prilly and sired by a grandson of this same famous foundation cow.

THE DAM OF SIR INKA PRILLY SEGIS ALBINO is Princess Douglas Urmagel, a 24-lb. four-year-old daughter of Sir Urmagel Burke, a full brother to the 35-lb. cow, Urma Burke, and from the 31-lb. cow, Urmagelsche 2d A.

PRINCESS DOUGLAS URMAGEL is from a 29-lb. four-year-old daughter of DeKol Beets Segis, another well known son of King Segis.

THE THREE NEAREST DAMS of this young bull average over 28 lbs. Two of them being only four-year-olds. His seven nearest dams average 26.93 and his eighteen nearest dams average 26.77.

HE CARRIES THE SAME RELATIONSHIP TO King Segis as Segis Fayne Johanna, the only 50-lb. cow, Fancher Farm Maxie, the world's champion heifer with 47 lbs., and Mabel Segis Korndyke, former champion four-year-old with 40.32 lbs.

HE CARRIES A DOUBLE CROSS of both King Segis and the famous foundation cow, Prilly,—both animals familiar to breeders from coast to coast.

AND WE ARE OFFERING this young bull to you for $650, guaranteed sound in every respect and tuberculin tested by Federal veterinarians.

IF YOU WANT HIM, do not wait to write but send us a wire instructing us to hold for you.

The E. C. Schroeder Farms, Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

If You Want Milky Bulls

:5 Cows and Heifers with A. R. O. Records from a 12-lb. 2-year-old to a 31-b. jr. 4-year-old. All young heifers, bulls and bull calves from A. R. O. dams.

MARY SEGIS BEETS 252171

31.83 lbs. butter in 7 days, 121.25 lbs. in 30 days as a jr. 4-year-old. Wisconsin State Champion in 30-day division.

KING BEETS LYONS 113045

This sire is by King Lyons, 40 A. R. O. daughters, and out of a 32.60-lb. daughter of King Segis. His 6 nearest dams average 31.90 lbs. butter in 7 days. He has 50 sons and daughters in our herd.

THE SALE INCLUDES:

Mary Segis Beets, the Wisconsin State Champion in the Thirty-Day Division. As a junior 4-year-old she made 31.83 lbs. butter in 7 days and 121.25 lbs. in 30 days. As a jr. 3-year-old she has 28.26 lbs. in 7 days to her credit and as a jr. two-year-old 22.88 in seven days, 88.66 in 30 days. There is no reason why she should not come back again and do even better next year. She and her 2 daughters will be sold, one a yearling, the other a heifer.

Lady Bess Sue, a 28.89-lb. cow, 2 of her daughters, and her last calf, a bull, will be sold. A host of other good ones are included.

Also 10 heifers and heifer calves and about 8 bulls and bull calves, the oldest 18 months old.

Cleveland Johanna Sir Piebe is our junior herd sire. He is from Molly Johanna Korndyke with 30.64 lbs. butter in 7 days as a 2-yr.-old. (World's record when made.) His sire is a son of Pinehurst Piebe, a 34.43-lb. show cow.

All of the daughters of King Beets Lyons old enough to breed are in calf to this splendid young sire.

REMEMBER:

This is strictly a breeder's herd, established in 1898. Every female but one has been bred by us.

We will give the same guarantee against tuberculosis as was given at the National Sale at Milwaukee last June. We have been testing for tuberculosis the last fifteen years and have never had a reactor.

The sale will be held at the farm which is located five miles south of the Lake Mills depot, six miles west of Jefferson and eight miles northwest of Fort Atkinson.

Trains which will be met are as follows: The 8:50 A. M. east bound and the 11:57 A. M. west bound, Lake Mills; the 8:55 A. M. north bound, Jefferson.

The sale will begin promptly at 10:30 A. M.

Catalogs will be ready the day of the sale.

What An Expert Says About High Protein Feeds

Algoma, Wis., March 4, 1918.

Chas. A. Krause Milling Co.,
Milwaukee, Wis.

My Dear Sirs:

I believe that the feeds that have the greatest power to stimulate milk production have the least power in nourishing the reproductive organs.

I admit that high protein feeds stimulate milk production. It is true that cows making large records were fed rations containing a large amount of protein, but witness also the large number of such cows that are barren or entirely sterile as a result of such feeding.

I know herds right here, that have been fed largely upon high protein feeds, as recommended in conjunction with leguminous hays (high protein), that are now ruined by abortion. The fact that the cows carried their calves up to six to nine months is a pretty good indication that it is not germ abortion. It cannot be traced to any other source than improper feeding.

*High protein feeds have their place in the economy of feeding, but one thing must be remembered: **They must be fed with other feeds** that counteract their bad effects. Such feeds are corn, hominy, barley, etc., hominy being the cheapest at present.*

In carrying out this plan, alfalfa or clover hay, with plenty of good corn silage for roughage, and oats, corn, barley, bran and some one high protein feed, play an important part.

We should not let our thoughts run altogether to the milk pail. We should so feed and care for our cows that their vigor, health and reproductive powers are maintained.

Most sincerely yours,

(Signed) FRED PFUEHLER,
Official Tester of the Wolf River Cow Testing Association.

Why Cows Need a Balanced Ration

THE heavy milk cow of today may be compared to a machine. An experienced and careful operator can drive a machine at high speed day after day with only normal wear and tear. In the hands of an inexperienced operator, however, it is soon pounded to pieces, its working period is reduced, and while heavy production may be maintained for a time, the average is low.

Likewise, by the use of a high protein, but poorly balanced ration, a cow may be forced to show big results for a short time, but at the expense of her other functions. Feeders now realize that a cow's ration must be properly balanced by sufficient fats and carbohydrates.

A properly balanced ration which, while containing sufficient protein, furnishes in addition other necessary food elements, will produce a heavy flow of milk without in any way impairing the cow's general condition.

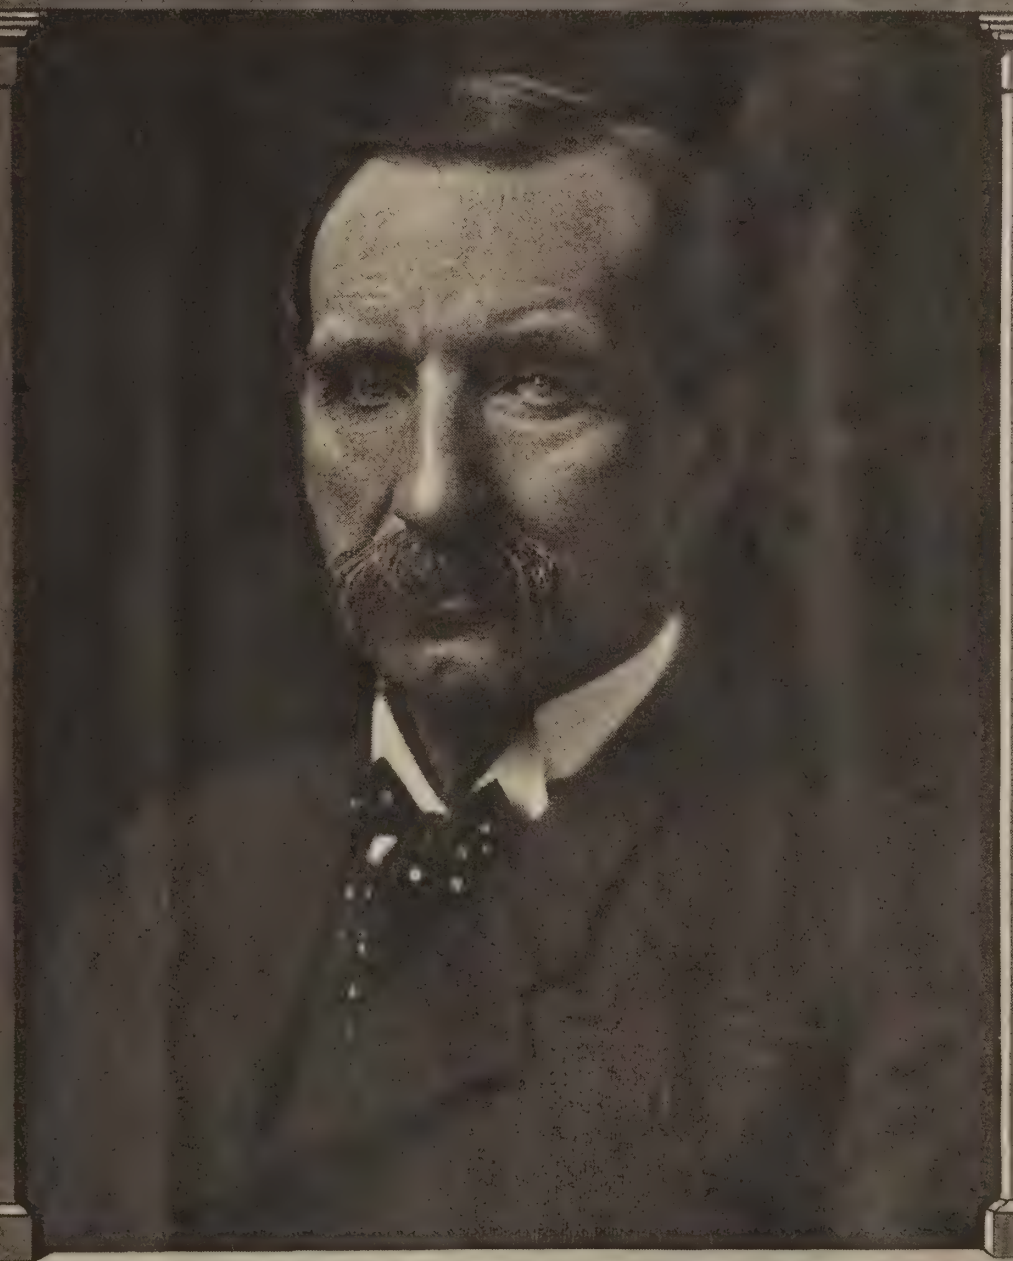
Three of the most widely used dairy feeds, BADGER STOCK FEED, CREAM CITY DAIRY FEED and KRAUSE DAIRY FEED, differ in protein content, so that the dairyman can select the one which is exactly suited to his requirements and will give him the results he desires.

The base of all of these feeds is BADGER HOMINY FEED, a rich, nutritious, palatable feed, high in digestibility, which stands at the head of every grain and feed stuff available to the American feeder. Fed alone, however, it is too compact and is not properly balanced. In these three feeds it is so combined with other elements as to form a perfectly balanced ration, which insures heavy milk production and, instead of lessening reproductive power, increases it.

BADGER STOCK FEED is designed to meet the need where a comparatively low protein and high carbohydrate feed is desired.

CREAM CITY DAIRY FEED has a good percentage of carbohydrates and fat, which keep the cow in good condition, with just the right amount of protein to produce a good flow of milk.

KRAUSE DAIRY FEED runs higher in protein, to meet the necessity for heavy milk production and for use where feeders wish to use home grown grains in the ration.



You can use no better feeds than these perfectly balanced rations, made up by a manufacturer of high standing and long experience. No feeds you can mix yourself can be as scientifically accurate, as economical, as thoroughly dependable.

Ask your dealer for the feed best suited to your requirements; write for free samples and full information.

Effect of Oak Leaves on Cow's Milk Flow

HOARD'S DAIRYMAN:—I am tendering the following information because if I had had it, it would have saved me a thousand dollars or more in production last year.

My herd had been accustomed to exercise in a good-sized wood lot. Last June, a year ago, I decided to pull down the trees for the purpose of clearing it up as a pasture lot. The trees were felled during June, just when they were coming out nice and green. A few were felled daily. My cattle, who are barn fed the year round, went after those green leaves with a vengeance. A good many of the trees were black oak.

About a week after the first trees were felled, one-half my herd fell off tremendously in milk. One cow that was producing eighty pounds of milk did not give an ounce for three days. She then began to increase and gradually came up to about thirty-five pounds, and I believe finally to forty pounds per day. The tannic acid in those oak leaves did the business.

I went to a number of veterinarians to find the cause of the great falling off in production, and I did not find a one who could suggest the cause, although I mentioned the oak leaves to everyone of them. Eventually I did find a veterinarian of national reputation, and he said he had heard of similar results on several occasions, and I am myself perfectly satisfied that the oak leaves were the cause. I am also satisfied that even the amount of oak leaves that cattle may gather in wood lots or passing through woods with underbrush will have the result of setting up a condition of indigestion that is very bad for milk production.

Maryland. H. M. ROWE.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

An Impossible Task

We fed him chicken twice a day,
We gave him turkey, too.
Sweet hams were often sent his way,
And lamb and steak and stew.
He had a little attic room,
As snug as it could be.
The movies cleared away his gloom,
As far as we could see.
He didn't have to work so hard,
His chores were mighty light.
We held him in a high regard
From morning until night.

All dairy tasks were quite a cinch,
A patent milking rig.
We did his labors in a pinch
His salary was big.
We called him "Mister"—let him go
To town, say twice a week.
We gave him clothes for Sunday show,
For style is what they seek.
But, after all was said and done,
The feeding and the play,
Them city lights and laughter won,
Th' dern fool wouldn't stay!

The Best Reason of All

Dairyman Jinks has written out seven reasons why he won't buy a new cream separator:

The old one is good enough.

He doesn't want to spend the money.

He's used to the one he has.

He'll make the other do.

One cream separator is as good as another.

The salesmen bother him.

His father used the one he has now.

But the best reason of all he does not give,—he just hasn't proper reasoning power.

Making the Best of It

"I attended the finest Holstein auction I ever saw the other day."

"Do any buying?"

"There were seventy registered animals, all at a bargain."

"Guess you took a whole herd then, eh?"

"Nope. But I bought one prime heifer and took the rest of it out in wishing."

If Hindenburg Could Reach Our Dairy Farms

"Cut the legs off all milk cows."

"Leave no calf standing."

"Burn every barn you see."

"Concentrate shell fire on silos."

"Poison every cream separator you find."

"Put the torch to corn cribs."

"Dairymen and their families should be executed."

"Destroy pasture land."

"Deport farm help of every kind."

"Capture every tractor in sight."

The Peace Bells Ring

How good to know that when spring comes,
With apple blossoms in her hair,
And when the May-time bee-time hums
That peace will greet us everywhere!
How good to know that letters now,
From boys who smiled and went away,
Will soon be saying: "Back ere long;
It's Home, Sweet Home' the soldier's song,
We're packing up today."

How good to know that herds will graze
In meadows shadowed by no cloud.
The storm has passed—the blood red haze,
The heartaches and the heads we bowed.
For war seems kin to tempests wild
That bent their fury on the land.
Then, peace, like sunshine, breaking through,
Let's God's smile mingle with the blue
As worlds walk hand in hand.

How good to know that as spring smiles
From out the melting cloak of white,
New seed will quiver o'er the miles;
New roses raise to holy light.
And men will toil and cattle trudge
Down many a little country lane.
Peace! Peace is here! The fight is done,
That which was wholly just, is won,
And we can smile again!

Advantage in buying a

DE LAVAL

NOW

Butter-fat is now worth twice as much as it was two or three years ago.

So is labor.

A De Laval saves both.

And never before was there so urgent reason for saving every ounce of butter-fat and every half-hour of time and labor.

A De Laval will now pay for itself in half the time, compared with former years.

Buy it now and it will save its cost in a few months.

See the nearest De Laval agent right away and let him show you what the De Laval will save for you. If you do not know the De Laval agent, write direct for any desired information.

Tributes to W. D. Hoard by Prominent Men

ON October 29, 1914, the portrait of William Dempster Hoard, editor and founder of Hoard's Dairyman, was given by the A erican Guernsey Cattle Club to the Saddle and S oin Club of Chicago. A banquet was held at th time in honor of Mr. Hoard at the Stock Y ds Inn, Chicago, but feeble health prevented h from being present at that time. Several p minent men paid high tribute to the service w ch he had rendered to the nation and also pre- s ed some personal history. These addresses w e not published in Hoard's Dairyman, because w considered them largely a personal matter. It n seems both fitting and wise to publish these s eral tributes which enumerate some of the most p minent activities of his life.

he exercises on this occasion were in charge of M. W. W. Marsh who, in his opening address, said:

Ladies and Gentlemen:—A very great honor has c e to me in presiding over this gathering, na- i al in character. From Maine and New Hamp- l e to California the great breed of cattle, the g at industry with which we are allied, is repre- s ted. I know full well, much as we love and l al as we are to the yellow cow, the occasion is n h greater than an attempt to do honor to her. I elieve this meeting is epoch-marking in the fact t we recognize here tonight, purposefully, the w k of a man who is a true servant of humanity; t work of a man along lines just outside of the l elight, just outside of those vocations in which p lic applause and headlines and fame in this day a apt to come. In other words, in animal hus- b dry,—and in agriculture we do not expect to h e the same recognition from the world and the p lic that they have in other walks of life. But t ight, in a gathering, national in its character, t life and work of our dear old leader, Hoard, a to be publicly recognized, and in doing that we d honor to ourselves and to the vocation with w ch we are allied.

The opportunity, the great privilege of telling h is work. devolves on other people; it is just my d y to introduce those people and to hand over t he Club, which is to care for and to guard, the p trait of the man whom we have chosen and, so f as it is in our power, to put him among the first t he immortals of our industry.

I am not going to say any more, because there a other people to talk about the Governor, and it w ld not be right for me to introduce any other s ject. On behalf of the Club, Dr. Favill will ac- t the portrait."

The fine portrait, painted by Mr. Arvid Nyholm o New York City, was here unveiled and re- ved with much applause.

n speaking for the Saddle and Sirloin Club, the s Dr. H. B. Favill, vice-president of the Hol- n-Friesian Association, said:

If there is great hesitation on my part in ac- ting so agreeable a duty and so noticeable a d inction as is offered me this evening, there is a s son, and the reason is a sense of inadequacy, a s se of distrust in my ability to walk just the line t I ought to walk in this matter. If I were to all that is in my heart to say on this subject, ould say too much, and if I say only enough for occasion, I shall not have said half the truth.

My feelings in this matter are deeply personal well as merely official. I have traditional relation Governor Hoard, born of respect and affection him—family tradition, neighborhood tradition. ay say, incidentally, that he was an intimate panion of my father's generation, his brothers ticularly. Two of my father's brothers and vernor Hoard, and four others, formed the first rymen's Association of Wisconsin. Soon after t—not so soon, but while I was hardly more n a boy, I became, when Governor Hoard was t elected Governor, his family physician. The tionship was not that of physician and patient, vas that of a young man deeply impressed with valuable friendship of an older man, and Gov- or Hoard is one of the few men I have ever n with whom I could associate half an hour at time and always learn something. And so, as e went on, and I traveled along in that com- nwealth more or less intimately with Governor ard, and always with my eyes fixed upon his er, I have seen him take a position in that mmonwealth—politically at that time—that was ays significant. I have seen his triumphs and ave seen his failure, if one may so call it, po- cally, always on the basis of principle. And the only defeat that he ever had was a defeat upon principle. And so as the time went on and I grew older and grew away from that locality, always that friendship has been maintained, always that relationship. So you can see that I come to this situation with a sense of personal interest that few people could have.

"In more recent years, as my interests began to be changed, and I began to have a fundamental and increasingly deep interest in agricultural affairs, I saw that all my early estimate of Governor Hoard was far short of its true level. I began to see, as I came to figure the various things that go on in this country, that although we had in Wisconsin statesmen, men of affairs, men of breadth, and power, and influence, and insight, that most of them were really superficial in comparison with Governor Hoard; that the statesmanship of Governor Hoard, as Mr. Marsh has so aptly stated, just outside of the limelight, was the statesmanship of our foundation; that whereas other men were dealing with the framework of our social structure, he was dealing with its sources, its foundations, its cornerstones. And so, as my familiarity with his work increased, and as I came more and more to follow the lines of his influence every year, I have come to see more fully that his influence is not to be measured by Wisconsin, not to be measured by the confines of the United States, but that his influence has reached the world around, wherever a community is sufficiently enlightened to realize that agriculture is its foundation and wherever it is sufficiently specialized to see that of all the branches of agriculture, dairying is the most important.

"Therefore, I have come to feel with regard to Governor Hoard that he is a man of the broadest statesmanship and I have yet to know, in casting over in my mind all of the public figures of this country, I have yet to realize, a man whose influence upon the welfare of this country has been greater than that of Governor Hoard.

"That being the case, the question is always before us, how has he done it? and I say he has done it by devotion to a cause; he has done it by patience, insistence, dogged determination to go on and on until he accomplished what he was at, and never has he compromised. And so, although we can see in this same agricultural world and although we can see in the dairy world great figures, men of great influence and great power, after all, here is the man who has carried the key to the recesses of the closed mind in this country. He is the man who has carried the torch that has fired men's souls, and this is the man that we must acknowledge as leader in the whole realm of agriculture and dairying thought in the world.

"The Saddle and Sirloin Club honors itself in accepting for a place upon its walls this portrait. Always it has held in highest esteem, in great appreciation, Governor Hoard. Only now has it come to the point where it includes his portrait in its gallery.

"You may wonder why it should be interested in this portrait for its gallery. The Saddle and Sirloin Club is not a mere social convenience. It is more than that, it is a clearing house for agricultural thought, and more than that it is an educational institution and, thanks to the great vision, and insight and inspiration of Mr. R. B. Ogilvie, who is really the father of the Club and the originator of the idea of the gallery such as we have, this movement has gone on and on, not as a decorative feature, but as a feature of perpetual education to the breeders and the agricultural men generally in this country, with the hope that it will go on and on and that its usefulness as an educational feature has only just started. For that reason, the Club welcomes the gift of the American Guernsey Club of this portrait of Governor Hoard and receives it with gratitude and thorough enthusiasm, feeling that no place that is filled by a portrait upon its walls will be more distinguished, more highly honored, more absolutely appreciated in the future of our great industry than will this place in which appears the portrait of Governor Hoard and, on behalf of the Club, I have to extend to you our heartfelt thanks."

Life and Work of Governor Hoard

CHARLES L. HILL OF ROSENDALE, WIS.

It is particularly fitting that this day which has been so full of interest to Guernsey breeders should close by our doing honor to one who, above all others, all dairymen delight to honor.

At last year's National Dairy Show the suggestion was made that in view of the fact of the International Amphitheatre having probably become the permanent home of the National Dairy Show, and the Saddle and Sirloin Club more and more the home of so many of the leaders in all branches of this industry, for the week of the show, that we ask the officers of the Club to be allowed to place some portraits of the leaders of this industry on the walls which have been used to immortalize the leaders of kindred industries. The suggestion was very happily received by the officers of the Club. Space has been set aside in which we may place portraits of men whom the dairy world deems benefactors.

The Executive Committee of the American Guernsey Cattle Club asked the privilege of placing on these walls the portrait of Governor Hoard, who, more than any other one man, has so unselfishly given his life to all lines of this industry. This, then, is the first portrait with which we start our gallery of the immortals of the dairy world. I have been asked to review briefly his life and some of the things he has accomplished.

William Dempster Hoard was born in Stockbridge, Madison County, New York, October 10th, 1836, the original name of the family being Hoar, and being the same family from which came Senator Hoar of Massachusetts and Congressman Horr of Michigan. The "d" was added to the name by Mr. Hoard's great-great-grandfather in 1760.

Of Mr. Hoard's boyhood life on the farm we have time to say a little. He delights to tell of the days spent with his grandfather on the old homestead. On the mantle over his office fireplace there is a grain sickle that his grandfather used when Mr. Hoard was a small boy; and when he was but nine years old, one day his grandfather's back being turned, he took the sickle and attempted to cut grain, and he will show you the scar on his finger as the result of his first trial as a harvest hand. When sixteen years of age he began to work for a well-to-do dairyman named Waterman Simons, who taught him to make both butter and cheese on the farm. Mr. Simons kept a herd of fifty cows that averaged above six hundred pounds of cheese each per year, and it is easy to see where Governor Hoard received his early knowledge and inspiration for this industry.

He came West in 1857 and, having joined the Methodist church at Lowell, Wis., he studied to become an exhorter and received a license to exhort, but having differed with the Presiding Elder over some of the doctrines of the church, particularly, he burned the license and went to cutting wood. That winter he helped cut two hundred cords of wood at twenty-five cents per cord, and when he received his pay, included was a bad $2.00 bill which represented four days' hard work, and Governor Hoard never fails to speak of the impression that this made on him regarding the need to the poor of sound money.

For the next three years he taught singing school in many towns from Waupun to the southern border of the state. He also gave instruction on the violin. He moved to Lake Mills in 1860, and there, on February 9th, 1860, he was married to Agnes Elizabeth Bragg. In 1861 he enlisted in Company E, 4th Wis. Volunteers, and was with Gen. Butler at the capture of New Orleans. On account of ill health, he had to leave the army in 1862 and he went to his father's home in New York, but his health having improved, he again enlisted in 1864 in Battery A, New York Light Artillery, and served to the end of the war, 1865. Immediately following the war he came back to Wisconsin and settled at Columbus, where he went into the nursery and hop growing business. He made some money in the nursery business, but lost it all, and more, growing hops, and it took him twenty years to pay his debts. He started the Jefferson County Union at Lake Mills, March 17th, 1870, and three years later moved it to Fort Atkinson. In 1871 he organized the Jefferson County Dairymen's Association. The success of this organization led to his organizing, in 1872, the Wisconsin State Dairymen's Association, of which he was the first secretary. This was among the first organizations of its kind in the United States. He also helped organize the Northwestern Dairymen's Association of which he was later president, until this gave way. In 1873 he helped organize the Watertown Dairy Board of Trade. It was in these years of the early '70s, apparently, that he had his first vision of what dairying in the West might become. In 1870 the Wisconsin cheese product

amounted to less than 1,000,000 lbs., and this seemed an enormous amount to the people of those days. Then all cheese was sold on the basis of the Liverpool market and the bulk of it was shipped there, except the Wisconsin product. New York State and the Western Reserve in Ohio were the greatest cheese producing sections. Mr. Hoard thought if only the prohibitive freight rates to the Atlantic seaboard could be reduced, dairying would increase by leaps and bounds. It was costing then 2½ cents a pound to ship cheese in common cars to New York.

He made a trip to Chicago and interviewed the agents of all the different freight lines to the Atlantic coast, but when he told them what he wanted, they laughed at him. The last man he went to see was Mr. W. W. Chandler, agent of the Star Union Line, the first refrigerator line in the United States. When he went into the office and spoke his little piece, Mr. Chandler wheeled in his chair and said, "What do you want, sir?" Mr. Hoard replied, "I represent a million pounds of Wisconsin cheese seeking an outlet on the Atlantic seaboard at rates that will allow us to compete with other cheese producing sections. I want you to make a rate of one cent a pound from Wisconsin to the Atlantic seaboard, in refrigerator cars, and I also want you to send a refrigerator car to Watertown, Wis., at a meeting of our Dairy Board next week, and come yourself to explain its advantages and workings." Mr. Chandler replied, "Is there anything else you want?" and Mr. Hoard said, "Not now." The very audacity of the request seemed to gain its point, because Mr. Chandler said he would do it. And this rate was in effect for many years and is practically the rate today. Cheese factories then began rapidly to increase in numbers and the cheese business continually increased, until Dairy and Food Commissioner J. Q. Emery of Wisconsin now estimates that Wisconsin cheese products for the year 1913 exceeded 190,000,000 lbs., and in the same year the estimate shows 133,000,000 pounds of butter, which together with condensed milk, market milk, cream, and by-products would exceed in value $100,000,000.

From the very first publication of the Jefferson County Union, which is today one of the best county papers in Wisconsin, he published one or two columns of dairy matter, and he constantly urged the farmers of Jefferson County to go into the dairy business.

In 1885 his son, Arthur Hoard, suggested that he believed there was a field for a special dairy paper. His friend, Edward Coe of Whitewater, suggested the name "Hoard's Dairyman," and the venture was undertaken. From the small, four-page paper of that day Hoard's Dairyman has now become the leading dairy paper of the world, with thirty to forty pages weekly and with a circulation of 75,000. It goes into every state in the Union and practically all foreign countries. While visiting Sir Henry Lennard's farm near London last summer, Mr. Lennard told me that he not only took and read Hoard's Dairyman, but also had a copy come for his man, and he sent word to Mr. Hoard that all he knew about the dairy business he learned from Hoard's Dairyman. The same testimony has come to me from dairymen in Australia, New Zealand, and Japan. Doubtless the same is true of every other country in which the English language is read.

At a meeting of the Executive Committee of the Wisconsin Dairymen's Association held in Milwaukee in 1884, Governor Hoard offered a resolution asking the legislature of the state of Wisconsin to provide some sort of a system of farmers' institutes, and appropriation was made at the next session of the legislature and this movement has spread practically to every state in the Union and has been one of the most powerful influences in agricultural education.

Probably Governor Hoard is better known for his championship of the special purpose dairy cow than for any other one thing. To thousands of audiences in every state in the Union he has said: "You don't hunt chickens with a bull dog, and why will you insist in dairying with a beef cow." In his study of the subject he prepared a series of charts to use at farmers' institutes and dairy conventions, the thought of the address being, "Temperament produces function and function controls form." Wishing himself to own some of the best dairy cattle for the purpose of study, he purchased, about 1885, both pure-bred Guernsey and Jersey cows. In the first address I ever heard him make, I remember hearing him refer to his Jersey cow, Queen Felch, and his Guernsey cow, Bonnibel. At the same time he bought from Mr. Fairbanks the Guernsey bull, Nutwood, son of Materna, of World's Fair dairy fame, and later sold him back to Mr. Fairbanks.

In later years, when financial conditions permitted, he bought the beautiful farm just north of Fort Atkinson, now known as the Hoard's Dairyman Farm. Here he keeps one of the best herds of Guernseys in the country. By his example on this farm, coupled with the teachings in the paper, he has helped give a wonderful impetus to alfalfa culture.

The starting of the farmers' institutes and the real beginning of agricultural education at the University of Wisconsin in 1886, gave an impetus and inspiration to agriculture, and the farmer became a respected citizen in that state.

In March, 1888, there were three candidates in the field for the Republican nomination for Governor of Wisconsin: E. C. McFetridge, H. A. Taylor, and Col. George Ginty. On the morning of March 26th, 1888, when Mr. Hoard started down to the office, the first man he met said, "Have you seen the Sentinel this morning, Mr. Hoard?" meaning the Milwaukee Sentinel. Mr. Hoard replied he had not, and the man said, "Better look at it." He was so accosted two or three times on the way down town, and when he reached the office he saw the paper. There was a long article, purporting to come from Madison, suggesting Mr. Hoard's name for Governor. It later turned out that this was written in the Sentinel office by Horace Rublee, the editor. Mr. Hoard took the suggestion as a joke, but at once began to get telegrams of congratulations, and his candidacy gained such headway that when the convention was held in September he was unanimously nominated on the first formal ballot. He was elected by a 20,000 plurality over James Morgan, Democratic nominee. During the season of legislature in 1889 there was passed a law compelling the teaching of English in all public and parochial schools, and not a single member of the legislature, either Republican or Democrat, voted against it. Within the next year, however, very strong opposition to the law arose on the part of those interested in the parochial schools, and when the next convention was held, in the fall of 1890, the politicians urged Governor Hoard and others in charge to weaken on the Bennett law, the name by which this law was generally known. Governor Hoard said he would never do it; that this law was right, and that if he was to be nominated for Governor, the party platform must declare in favor of the thought expressed in the Bennett law. This was the year, you will remember, of the Harrison defeat, and with the influence of national politics, combined with the opposition to the Bennett law, Governor Hoard was defeated by George W. Peck by 27,000 plurality. This is but an illustration of Governor Hoard's continual attitude towards anything that he considers right, regardless of policy or other people's opinion. Since that time, he has served his state as Chairman of the Board of Regents of the State University, as President of the Wisconsin Board of Commissioners for the Louisiana Purchase Exposition at St. Louis in 1904, and in many other capacities. During his term as Governor there was passed the law creating the Dairy and Food Commission, which, I believe, was the first one of its kind. He has also been the best known and most active worker for anti-oleo legislation, and anyone talking to him will soon discover that there is now no subject nearer his heart than that of seeing that the dairymen shall have the benefit of having oleo and other imitation dairy products sold for what they are.

If I were gifted with the use of mother tongue, I would count it the greatest privilege of my life to offer some words of eulogy of the character of this man. Tonight, in my mind's eye, I see the Father of Modern Dairying by his log fire in his complete but unpretentious home at Fort Atkinson, and he is undoubtedly thinking of what we are doing. Is it not a privilege to stop for an hour at this busy show, and recount some of the things he has done for us all, and to think that we can thus show some appreciation while he is still alive, to know and enjoy it?

The need of the world is vision. Here is a man who, returning to Wisconsin at the close of the Civil War, when the raising of wheat was the only kind of agriculture to which the farmers were paying attention, looked into the future and saw something of what dairying might do for the soil and the people. Doutbless then, as in every year since, someone told him, "The business will be overdone," but he heard them not. First, in his home county and through the local papers he urged more and better dairying. Then, in a rapidly widening field of influence, he worked until all the world rise up to call him their benefactor and acknowledge their indebtedness to him. Now, to the dairy world, Fort Atkinson is the Mecca to which come those who wish to pay him their honor and respects. They find not the typical unapproachable great man, but one who will treat them like an old friend; and, day in and day out, and year in and year out, his private office, with the door ajar from the reception room to which all are welcome and from which all go saying, "I am so glad I could have the privilege of shaking his hand; looking into his kindly, homely face and in my humble way how to honor him who, as years go by, we will be increasingly glad to honor." Not honor alone has come to him, for, while he has so cheerfully given his time to the public, there has come to him a reward of his labors that which could bring him all the luxuries in the world in place of the necessities his simplicity desires. It has made possible for him to gratify his desire to help the world in many ways. While his vision of the possibilities of modern dairying and of the special dairy cow are worthy of our highest admiration and praise, still we must honor him also for his championship of honesty and integrity in private, political, and business life. He was willing to go down to political defeat for a cause he knew was right, and which everyone else must now acknowledge as right. He gave years of his life to fight dishonesty and fraud in the adulteration of food products, and for this the dairy world owes him a debt it never can pay.

While he cannot be with us tonight, on account of his health, I am sure he is with us in spirit. It is the wish of every one present that he may not only reach the four score years which he will reach so soon, but that for many more years we may all call him benefactor and friend.

An Appreciation of the Man

DEAN H. L. RUSSELL, WISCONSIN COLLEGE OF AGRICULTURE

In rising to honor the man whose portrait has been presented tonight, I feel as if I was rising to do honor to my father, and I believe that every Badger who has any regard for agricultural education feels likewise.

And this is no mere idealistic conception, so far as I personally am concerned, for Governor Hoard means more to me than he does to many of those who are here tonight.

It so happened, when it became necessary for Dean Henry to lay down the administrative responsibilities which he had carried for so many years in connection with the College of Agriculture of the University of Wisconsin, and those responsibilities passed to much younger shoulders that Governor Hoard was a member at that time of the governing board of regents of the University, and in the widening sphere of influence of that college, it was the help which came from him in large measure which made possible the development of that institution. Governor Davidson appointed Mr. Hoard as regent of the University in 1907, and within a few months from the time that he was appointed a member he was elected president of the Board—an unusual honor to be conferred in so short a period of time, while at the same time he retained the chairmanship of the Committee on Agriculture. In this position he continued until 1910, when it became necessary, on account of declining health, for him to relinquish this position which he had filled with unusual ability. It is a pleasure and a privilege for me to stand here tonight and testify that I believe the success of the institution was due as much to the guiding hand of Governor Hoard in the formation of our policies as to any other man.

For singleness of purpose and devotion to agriculture, I do not know that I have ever seen his superior. In fact, in connection with his work at the University, there were some who felt that perhaps he even over-emphasized the importance of agriculture. Some of our literary colleagues felt that he was giving more attention to agriculture than to anything else, but I suppose this feeling largely arose from the fact that agriculture had so long been considered the tail of the intellectual kite, that some of our good friends had not yet realized that the tail was really the balancing force that kept the head of the kite in the wind. Governor Hoard believed that culture could be imparted through the study of nature as well as the arts of man, and in doing so he did not belittle the efforts which man has made which have been expressed through the humanities, but he did believe that, if properly presented, it was possible to secure just as broad a degree of culture through the study of nature itself as through the medium of the customary artistic and literary channels. Governor Hoard looked for light through the working out of the fundamental laws governing the practical operations of life an opportunity for culture as much as in Greek roots and mathematical theorems. In fact, the processes of nature were to him, as they are to many of us, the dark spaces which need to be lightened. Many of you have heard him refer to

that the inside of a dairy cow was perhaps the
rst spot on earth.
Ie agricultural college in those days was fre-
ly denominated the "Cow College," but we in
onsin regarded it as a matter of pride to be
iated with the cow. It is the cow that has
Wisconsin famous, and it is Governor Hoard
as contributed most to this work.
have in Governor Hoard not only a man
as been of inestimable importance in the de-
ment of the work of the University, but as has
testified to already by others this evening, a
common man who has kept his feet on the
d while at the same time he has had his head
e air.
u go into Governor Hoard's home and look at
haracter of the books in the library, and you
find there Persian and Hindu literature, as
as the literary treasures of the western civi-
ons, which he so much enjoys. You talk with
nd you are talking with a philosopher; you
alking with a man who is self-taught in most
s, and yet a man who has peered ahead with
on that is not equaled by many a University
A wide reader, a man of philosophic thought,
et a man who has constantly kept himself in
with men and affairs, and has so broadened
lf that he is one of the most catholic men
it has ever been my privilege to meet. I be-
that Governor Hoard is the most striking il-
tion we have in Wisconsin, so far as my ac-
tance is concerned, of what a man can do in
ay of intellectual betterment of himself and
llows without a University education. As I
so often talked with him and heard him tell of
fe, there continually comes to my mind the
traits in which he seems to resemble Abra-
Lincoln. Of course, I have no personal knowl-
of Lincoln, and therefore the picture in my
is wholly from historical sources, but as I
upon Governor Hoard and feel the influence
s personality, as I have listened to him, tell-
the story of the Lincoln-Douglas debates,
he as a young man heard, the resemblances
en the two men become more apparent.
times I have wondered what would have hap-
l to this man if he had had a University edu-
n. Might it not have spoiled him in many
? Might it not have destroyed that imagi-
e quality and philosophical insight which is so
a native talent, and which so frequently is
l and rendered mere commonplace by the rut
which the mind may sink when it is made to
v the outlined curricula which so frequently
s to University life?
vernor Hoard early got to the core of the
em of permanent agriculture and the relation
e stock to the same. The lessons of the seven-
which Mr. Hill has just referred to, were pat-
ent to him; he saw, if Wisconsin and the other states of the Mississippi Valley continued in the old lines of wheat raising, that it was their doom. I can remember as a boy in Southern Wisconsin when there was nothing grown but wheat, when the wages paid for binders to harvest the grain were $2.50 and $3.00 a day, with wheat selling at sixty cents a bushel. It was then that the single crop system of wheat culture in Wisconsin had reduced our yields to eight and ten or twelve bushels to the acre, that our people were forced to turn their attention to a different kind of agriculture; it was then that Governor Hoard saw with prophetic vision the absolute necessity of live stock in connection with our agriculture and, like the voice of one crying in the wilderness, he set the farmers of Wisconsin with their faces in the right direction, more than anyone else.

The previous speakers have referred to the formation of the Wisconsin Dairymen's Association, which occurred in February, 1872. Wisconsin honors these seven men who banded themselves together at that time for the development of dairying. To many of you, I presume those names are merely names, if known at all, but I want to give this list of names right here as an honor roll of which our state is proud. This list was led by W. D. Hoard; then there were Stephen Favill, A. D. Favill, W. S. Green, Chester Hazen, the man who built the first cheese factory in the state of Wisconsin, H. F. Dousman, and H. C. Drake. Those were the men who formed the Wisconsin Dairymen's Association. That association has not only the honor of being the first dairy association of America, but it has been the progenitor in our state of practically all the educational work which has been done along dairy lines. Out of the Dairymen's Association came later the State Buttermakers' Association and the State Cheesemakers' Association.

The Dairymen's Association was also the godfather of the Wisconsin Dairy School, the first educational effort made by any American University for the development of dairy education, and I have heard Dean Henry say that it was the Dairymen's Association that nursed through the precarious stages of infancy the Agricultural College itself. Now, gentlemen, when we consider the influences that have developed from the humble beginnings made by these seven men, the benefits that have come to the state in many directions from their efforts, I think you can appreciate that their names should go down as men of unusual type and character.

It is needless for me to dilate upon the personal work of Governor Hoard, but I need simply say he was a man who was unsparing of self,—was thoroughly unselfish in the promotion of dairying in all of its phases; he was a constant seeker after truth, a consistent advocate for intelligent agriculture and the application of science, and I may say I have very rarely seen a man bred in the world of practical affairs alone who has had such an appreciation of the importance and advantages of science. I know in our campaign against bovine tuberculosis, Governor Hoard was one of the first men in the state to embrace and utilize the tuberculin test. It had to be proven out, but he was one of the earliest to apply it to his own herd, and he has been its most consistent advocate ever since.

The introduction of alfalfa into this state is one of the crowning successes which he has accomplished from the agricultural point of view, and that was done by him in opposition to the advice of the Experiment Station; there is one place where Professor Henry and Governor Hoard failed to agree, and Governor Hoard was right. From the humble beginning then made, we have now come to be one of the leading alfalfa states east of the Mississippi River.

His advocacy of the use of lime and phosphorus is another illustration of the far-sightedness of the man; his efforts to lead the state in the direction of permanency of its agriculture.

He has gone beyond dairying; he sees in dairying an expression of agriculture, and anything and everything that will make for the uplift, the permanent, rational uplift of agriculture is the thing that finds place in his paper and through his expressions on the platform.

I recall at the time when we wanted to start the state soil survey in Wisconsin—it was while Governor Hoard was on the Board of Regents,—we secured the services of Professor Hopkins of Illinois, (we take off our hats to Illinois for the advanced position which she has taken on matters of soil fertility). The benefits which Professor Hopkins was able to show and the splendid work of Governor Hoard before the legislative committee made it possible for us to make a start in that important work in our state.

It is our regret that physical infirmities make it impossible for him to be with us tonight on this occasion, but time cannot rob us ever of the memory of his influence for dairy advancement, not only in the state of Wisconsin, but throughout the dairy world. His name will always be lovingly remembered as that of the Grand Old Man of the State, and Mr. President, I congratulate the American Guernsey Cattle Club for the honor they have done themselves in the presentation of this portrait as a permanent memento of this great dairy leader; I congratulate the Saddle and Sirloin Club of this city that they are the recipients of this portrait to put in their new Hall of Fame; and I congratulate the State of Wisconsin that we can offer so illustrious a name as that of Governor Hoard for this occasion.

W. D. Hoard Pioneer For Americanization

readers of Hoard's Dairyman know W. D.
oard very largely for the service he rendered
e dairy industry. His efforts and accomplish-
s were far greater than this. When he became
nor of Wisconsin his attention was called to
act that the English language was not taught
ny of the schools of Wisconsin. In his mes-
to the legislature he called attention to this
and urged a law that would make it impera-
or every child to learn how to read and speak
nguage of his country.
e Outlook published in its issue of April 24,
an article by William Herbert Hobbs, Uni-
y of Michigan, regarding Mr. Hoard's battle
mericanism, and it is as follows:

ccording to the expressed belief of Ludwig
, one of the Kaiser's ninety-three intellectu-
to speak German is to remain German'. The
Chancellor is said to have considered the most
tant political factor of modern times 'the in-
d and political fact that North America
s English'. That his followers have been re-
t to accept this as already settled is clear
the German-American Kultur movement of
ast generation, a movement which has aimed
ntinue the use of the German language by
grant Germans and their descendants, and to
the superiority of German ideals and meth-
ver those of this country. This attempt has
made through the medium of the German-
age newspapers and the many German socie-
n which German is the language of inter-
e and in which the German colors and the
r's portraits have been much in evidence; but
than all through the parochial schools main-
d under the fostering care of the German
h—a church which in Germany has always been the firm supporter of absolute government, whether Protestant (German Lutheran) or Catholic. But for the war it is doubtful if we as a people should have learned how largely this propaganda was supported and financed from Germany, and we have not yet gone to the root of the matter.

"To a large extent the American Kultur movement has been directed by men in the German departments of our American universities, some of them still German citizens, and many of them with strong German sympathies even when not outwardly disloyal to the United States. The leaders in this movement early discovered that the greatest factor in producing loyal American citizens is the American public school, and, under the pretext of the necessity for imparting religious instruction, German-American parents were, partly through persuasion, but far more through coercion, induced to withdraw their children from the public schools and educate them in church-controlled parochial schools where the language and the culture of the classroom have been those of the Fatherland. A direct result has been that these children have grown up unable to speak the language of their country and with little conception of its history or of the ideals of freedom upon which it has been founded. Long a resident of Wisconsin, I have visited sections of the state where to be understood one was compelled to speak German; and conditions are only less serious in some of the other Middle Western states.

"An incident which occurred in Jefferson County, Wisconsin, in 1870 will emphasize the helplessness of the German farmers in such sections, and it points to the menace of their ignorance as citizens of our common country. Several German swindlers from Chicago represented to the farmers that they were government census-takers, and papers were given out printed in English which the farmers were told they must sign, these papers being, in reality, promissory notes in payment of agricultural machinery. Inasmuch as the farmers were unable to read English, they were easily imposed upon, and the swindlers soon acquired notes aggregating $8,000 which were promptly cashed at the local bank before returning to Chicago.

"Out of this incident grew what will one day be regarded as an important landmark in the history of Americanization, for it had much to do with the pioneer movement looking toward nationalism through compulsory suppression of Kaiserism.

"The anger of the German farmers upon finding that they had been swindled it would be hard to exaggerate, as was soon to be learned by the United States Marshal appointed to take the census of four townships in Jefferson County. At the mere mention of the word "census" doors were slammed in his face, he was threatened with violence, and even driven off with pitchforks. A splendidly patriotic American and a veteran of the Civil War, this census-taker was no other than William Dempster Hoard, who later became Governor of the state, and whose name as the editor of Hoard's Dairyman has long been a household word among farmers. Full of years—he is now eighty years of age, but with a mind still unimpaired—he recently gave an interview to a representative of the Milwaukee Journal, in which, referring to his experiences as census-taker, he said: 'I remonstrated with one of these Germans for letting his three sons grow up unable to read a word of English. The reply was. 'Deutsch ist gut genug fur sie' ('German is good enough for them'). This was countered by the question, 'Was it good

enough to keep you from signing a promissory note of $800 and being swindled because you could not read English?' and the farmer was visibly disconcerted, appearing to have acquired a new idea.

"Upon being elected governor of Wisconsin in 1888, Mr. Hoard drew up the now famous Bennett Bill, which was aimed to have the English language taught in all schools. This bill was enacted into law in 1889. Sections 1 and 5 of the law are as follows:

"Section 1. Every parent or other person having under his control a child between the ages of seven and fourteen years shall annually cause such child to attend some public or private school.

"Section 5. No school shall be regarded as a school under this Act unless there shall be taught therein, as part of the elementary education of children, reading, writing, arithmetic, and United States history in the English language.

"The writer well remembers the political and social upheaval occasioned by the passage of this simple act. For once German Lutherans and German Catholics made common cause, though the Irish Catholics rather generally supported the Governor. Before the passage of the law a conference of the leaders of the Republican party in the state was held, and the Governor was thereupon notified that if he did not abandon the measure it would mean both his political ruin and the overthrow of the party. The prophetic reply was: 'We must stand up and save America from this thing. We must fight alienism and selfish ecclesiasticism, for unless we do, these dangers will rise up in still more menacing form in the future.'

"After the enactment of the Bennett Law, a committee of Lutheran pastors waited upon the Governor and insisted that he should not enforce the law. His reply was: 'When I became Governor of this state, I swore a solemn oath, upon the Bible, to uphold the Constitution of the United States, the Constitution of the State of Wisconsin, and all laws enacted in conformity therewith; and now you ministers of the Gospel come here and urge me to violate that solemn oath. It is my firm purpose to do my duty and to enforce the law.'

"Encouragement and support the Governor received from Archbishop Ireland, who at a reception in St. Paul took him aside and said: 'Governor, you must stand up. I must stand up. All who believe in America must stand up and fight this poisonous spirit of foreignism.' And stand up the Governor did, and he enforced the law without fear or favor, while no stone was being left unturned to bring about his defeat at the next election. By a plurality of 27,000 this was, in fact, accomplished largely through the defection of men of his own political party; and a Democratic legislature repealed the law in 1891, with the repealing act signed by a Democratic governor.

"It has been said of Governor Hoard that in securing the enactment of the Bennett Law when he did, this staunch patriot was twenty-five years in advance of his time. No doubt this is true, but it is now just twenty-five years since the Bennett Law was first introduced in the Wisconsin Legislature, and in respect to education in Americanism each of the last three years must be accounted the equivalent of many normal ones. The time would now seem to be ripe to root out this evil of the German parochial school, which can claim no reason for its existence save only that it fosters Kaiserism in America. It is for us now to take up and put through the splendid pioneer work of a Wisconsin governor, the luster on whose shield must grow brighter with the years, as the people are the better able to measure his great work, even though the immediate result was defeat and retirement from political life."

The Bennett Law in Wisconsin

The great World War has given a new understanding and a new interpretation of the Bennett Law, and it is perhaps not out of place to give a brief review of it and the political struggle which it created in Wisconsin. We take liberal extracts from a paper on the Bennett Law by Louise Phelps Kellogg and recently printed in the Wisconsin Magazine of History. The extracts are as follows:

The political significance of the Bennett Law agitation has long been a matter of record. German-American opposition to the law's provisions completely overturned the government of Wisconsin in the year 1890, elected a Democratic governor and legislature, sent in the succeeding years two Democratic senators and several Democratic representatives to Congress, and gave Wisconsin's vote to Grover Cleveland at his second election in 1892. The social significance of the agitation is realized only in connection with the present world crisis, and with Wisconsin's share in the nation's war upon Germany. The conditions of Wisconsin's German settlements, as revealed by the Bennett Law discussion, have an important bearing upon our present problems.

The Bennett Law was simply a compulsory educational law designed to prevent non-attendance and truancy in the schools, and child labor in the factories. In 1879 a compulsory school law had been placed upon the statute books. Its inefficacy was revealed by the biennial report for 1887-88 of Superintendent of Public Instruction Jesse B. Thayer. He called attention to the proportional decrease in public school attendance as compared with the state's increase of population. The numbers of children in the private and parochial schools he had not succeeded in obtaining. Statistics were produced during the Bennett Law campaign to show that from 40,000 to 50,000 children of the state, between the ages of seven and fourteen, attended no school. The extent of the state's illiteracy was thus called to the attention of the officials, whereupon Governor William D. Hoard in his first annual message of 1889 to the state legislature used these words, which have become historic: "The child that is, the citizen that is to be, has a right to demand of the state that it be provided as against all contingencies, with a reasonable amount of instruction in common English branches. Especially has it a right to demand that it be provided with the ability to read and write the language of this country. In this connection I would recommend such legislation as would make it the duty of county and city superintendents to inspect all schools for the purpose and with the authority to require that reading and writing in English be daily taught therein."

In response to the governor's recommendation a bill was introduced into the Assembly whose provisions were less drastic than the measures proposed by the message. It merely required the attendance of every child between the ages of seven and fourteen upon some school, in the district where he resided, for not less than twelve weeks, subject to a fine or penalty imposed upon the parents for noncompliance. In section five it was declared that "no school shall be regarded as a school unless there shall be taught therein, as part of the elementary education of children, reading, writing, arithmetic, and United States history, in the English language." Other sections provided against truancy and the employment of child labor. No person, apparently, saw anything about the bill obnoxious to any class of the population.

It is plain that its obnoxious character was not discovered until some time after its passage, and that this character was first revealed to the community by the protests of German religious bodies, interested in the maintenance of parochial schools.

There is a general impression that the earliest and most influential, if not the largest body of German immigrants to Wisconsin, belonged to the class now known as "intelligentia," the liberal and educated men who escaped from Germany because of political persecution after the unsuccessful revolution of 1848. This class, known as "Forty-eighters," and represented to the nation at large by Carl Schurz and his compeers, comprised but a small section of Wisconsin Germans, and although much before the public, was less influential with contemporary German-Americans than has been commonly supposed.

The earliest groups of Wisconsin Germans left the fatherland to escape religious rather than political persecution, and that not because they were more progressive, but because they were more conservative than their contemporaries in the prevailing state churches of their several localities. Moreover, the emigration was arranged and conducted by the pastors of congregations, which settled as colonies upon large areas of Wisconsin's public land. Even after persecution had ceased in Germany, congregational groups, closely knit by religious and social similarity, usually headed by their pastors, continued to emigrate and to build on Wisconsin soil a village for each group with a church and school similar to those in the home land. Thus in the New World German communities were reproduced with the institutions and atmosphere of the German home, where their former language, customs, and modes of thought were perpetuated.

The tendency of the younger generation was to break away from the home customs, to learn the English language, to mingle and assimilate with the youth of the land wherein they were born. The Lutheran church and the parochial school system were the bulwarks on which the older people relied to maintain their racial exclusiveness. It frequently happened that in the smaller communities the parents were more Americanized than the children. Instances were cited during the Bennett Law discussion, of English-speaking fathers, tives of Germany, whose children, born in Wis sin, knew only German. This was the conditio affairs that the Bennett Law was designe modify.

Occasionally one boldly stated that it was h that the Germans would remain a distinct cla the United States, that they and their poste would constitute a separate and perhaps a supe element in the great current of American life. the national pride grew the determination to m tain a "Germandom" in America grew likewise

Along with this pride of race grew the prid language. "Hold fast to the German customs manners and the dear mother tongue," was adjuration oftenest addressed to the German ers of Wisconsin.

The first mutterings of the storm were hear June, 1889. Two German synods, in session spectively at Portage and Sheboygan, passed lutions denouncing the educational law passe the late session of the legislature as an attack on German churches, schools, language, and p June 20-25 the Evangelical Lutheran synod Wisconsin met at St. Peter's church, Milwau On the latter date resolutions were passed de ing that the new school law was oppressive an rannical, that its enforcement threatened the istence of the synod's schools and churches, that it ought to be repealed. A committee o prominent pastors, editors, and professors wa pointed to take steps to carry these resolut into effect; this committee first suggested that Germans of the state should "emphasize their laration at the ballot-box." July 27, a Ger paster wrote of "crushing the Republican pa if it did not yield to the demand for repeal. T threats of political action, however, were in early stages of the discussion merely sporadic committees first proposed that the law be ign and if prosecution ensued, its constitutionalit tested in the state supreme court.

The Milwaukee Sentinel was the first newsp to take up the challenge thrown down by champions of the Lutheran church. It was language requirement to which the church aut ties objected. Case after case came to light i subsequent discussion of children born and re in Wisconsin who were unable to speak a wo English. From Manitowoc came the statement not one in ten of the parochial schools in county taught a word of English. It was ass that even public schools in the thickly settled man districts were conducted wholly in Ger In fact, said the Manitowoc County Chro "strike the two words *in English* from the law not a churchman in the state coul be foun raise his voice against it."

During the heat of the contest each pol party accused the other of having brought o conflict. In truth neither Republicans nor D crats were eager to bring the Bennett Law int political arena; it was the situation itself forced the issue. The methods of the two pa were necessarily different: the Republicans s to soothe, convince, and persuade; the Demo sought to avoid the issue. Thus the Milwa Sentinel, leading organ of the party in powe chief supporter of Governor Hoard, filled its umns with simple, reasonable, well-written torials urging the need of the law, the harmles of its provisions, the ease with which its req ments might be met, and the advantages would ensue to the Germans themselves and children from its enforcement. The Madison ocrat, on the other hand, throughout the cr summer and autumn of 1889 carefully avoide mention of a subject that was agitating the m of nine-tenths of the people of Wisconsin. Democratic Milwaukee Journal, edited by L W. Nieman, raised other issues, largely ignore Bennett Law, and as late as December 26, wrote "It is amusing to read the efforts (o Republican papers) to convince the public tha Democrats are making the Bennett Law a pol issue."

Governor Hoard, on the other hand, less a and more outspoken, attempted to defend th in several speeches made during the autum 1889 at farmers' institutes and county fai was asserted by some that the country Ger were favorable to the law, and that the oppos existed only in the religious press at Milwa Hoard spoke enthusiastically about the " schoolhouse" as a watchword to rally the peo his standard. No one who reads the speech the campaign can doubt the governor's sinc or his enthusiasm for the cause of popular e tion.

The campaign was unexampled for earnes and intensity. The "Little Schoolhouse" wa symbol of the Republicans, "Stand by it,"

ring cry. October 9, 1890, Hoard wrote from executive chamber, "The duty of the state to ire, and the right of the children of the state ceive instruction in the language of the coun- hall be insisted on." Senator Spooner stumped state making speeches of great effectiveness persuasiveness. The Republicans were confi- of a successful result.

e Germans on their part were not less active. Anti-Bennett Law Clubs, used with such effect e Milwaukee municipal campaign, spread over state. Thousands of German leaflets were ed; songs were prepared whose refrain was ser Sprache und Sitten, die geben wir nicht Individual voters were solicited by pastors priests. The result is well known; the forces Germandom" united with the Democratic ma- made a clean sweep of the state. Peck was triumphantly elected, and at the legislative session of 1891 the Bennett Law was repealed.

But in its defeat, the principle of the law triumphed. In their very eagerness to prove that it was unnecessary, its opponents began to obey its behests. In its weakness appeared its strength. April 22 it was announced that the Lutherans had revised their school curriculum and introduced therein more English. By August, the parochial schools of Manitowoc County had so improved in the teaching of English, that scarce one was to be found that would be disqualified under the Bennett Law. The discussion had accomplished what the law could not do: the stronghold of "Germandom" was demolished. "It never shall happen again" became the motto of wise Germans; and as the heat of the conflict died away, and the animosities it awakened softened, the beneficent purpose of the law stood revealed. Gradually the teaching of English became the rule, not the exception, in all the schools of the state. Slowly Wisconsin Germans came to accept the plea of their noblest leader, Carl Schurz: "Let us never forget that we as Germans are not called upon here to form a separate nationality, but rather to contribute to the American nationality the strongest there is in us, and in place of our weakness to substitute the strength wherein our fellow-Americans excel us, and blend it with our wisdom. We should never forget that in the political life of this republic, we as Germans have no peculiar interests, but that the universal well-being is ours also. In the fires of the present world crisis and the testing of America, may we all learn that 'it is by unity of speech and harmony of thought that the ultimate American is to be the light of civilization'."

As He Spoke in Public

readers, we are sure, will be interested in a ew paragraphs taken from addresses made by Hoard on religious, patriotic, political, and agtural occasions. These excerpts reveal slightly s readth of interest in things, in people, and in They enunciate truths and sacred principles h he believed must be followed if people or na- are to reap the great rewards of life.

The Patriotism of the Puritan

is is the title of an address delivered many s ago on Forefathers' Day at Whitewater, Wis. nat occasion he said in part:

e of the most unique and in some respects in- rehensible figures that stand on the pages of world's history is the Puritan. Possessed of a ous faith which in some respects was cold and dding, more of Milton, Calvin, and John Knox than Christ, there was united with it a single- of purpose, a lofty courage, an almost mysti- nging for the altruism of democracy, and a erful correlation of broad intellectualization he narrowest of prejudice.

concept of God was more the satisfying of a utive justice that destroyed, than a mercy ould save. The Old Testament more than the gave color to his ideas of society, of law, of nment.

heredity he came from the great yeoman class nlaid with the strong mortar of Dutch blood had emigrated to the west of England. And is is but obedience to his strong Anglo-Saxon ity. But the strong tap-root that held him to entral idea and purpose of his destiny was om to worship God as he thought and wished. it be understood that religious liberty is the olid foundation on which we can build politid civil liberty. The Puritan had a dim conness of this truth, and to it gave the last neasure of devotion and sacrifice. He was nt to its logic but not always to its broadest n which would have made him more tolerant d's law of diversity in the outcome of all life rowth, spiritual as well as material.

the great conspicuous element of his nature ourage, both moral and physical. He might staken but never afraid of his conclusions, his ients, or the effects which should follow their ation.

e is the chit of all patriotism. Taken by and it is safer and a thousand times more fruit- listen to the counsels of courage than of dice. It is true in war, in statesmanship, in ss, in religion, in politics, in love. It may ways land you in some fat office, poor time g politician, but what have you or your for- to do with patriotism anyway?

riotism demands sacrifice, demands opposio corrupt men and measures, demands cour- defense of the people, even to the abandonof party, of friends, of life. Sacrifice, not seeking, is the baptismal seal of this virtue.

A Political Address

October 29th, 1898, Mr. Hoard addressed embers of the Hamilton Club of Chicago as s:

are the center from which has radiated that is useful in public conviction, much that riotic, and, after greeting you today, I feel ou hold straight-away and steadily to the central proposition that politics without pam is fraud.

politics there is an evolution taking place hout the whole country. Observant thinkers, men who are watching the signs of the times, notice that the talismanic call of party does not reach the public conviction it once did. There is a hunger in the heart of the people, irrespective of parties everywhere, for once more the reassertion of the old-time American doctrine: "My country, 'tis of thee". Patriotism is the key-note. What is patriotism? Patriotism means sacrifice, sacrifice everywhere, sacrifice of the individual for the public good. What is the meaning of treason? Treason means a sacrifice of the public good for the individual. The soldier standing on the picket line is the embodiment of a public trust. Whether he be there or in the field or elsewhere, he is the embodiment of a public trust, and if he proves false to that trust he is a traitor. In God's name, is not an office-holder an embodiment of public trust? And is not the time pretty near when we should begin to apply to men who serve the public in a civic sense the same doctrine of responsibility that we apply to the soldier? I am sick and tired beyond measure with the idea of one standard for the soldier who embarks his all, yea his life, for $13 a month, and another standard for the politician and the office-holder. And I tell you, good friends, there is an apathy today that we feel all over this country. What does it mean? It means that the public heart has lost confidence in the rectitude, patriotism, and self-sacrifice of our leadership, not of our beloved President—God bless him —for if there is a man today standing in the eye of the great American people who is conspicuous for this definition of patriotism—sacrifice of all matters for the public good, it is William McKinley. But we have too many men today who are political merchants, who are reaching out for public confidence with one hand and selling legislation for money with the other. I would like to see the appeal made to the public heart everywhere once more than politics, and Republican politics in particular, means absolute devotion to the public good, and nothing else.

Agricultural Citizenship

We desire to call particular attention to the extracts from the addresses "Agricultural Citizenship" and 'The Standard of Citizenship". These addresses were given nearly a quarter of a century ago, but how timely their subject matter! How wisely he saw the trend of this nation and how apprehensively he viewed the appeals of the demagogues to religious classes, to the laboring classes, to farmers as a class, etc.! To him there are no classes in American citizenship. We are either foreigners or Americans. He said:

It is one of the grandest things on earth to be an American citizen. Grand, because of the vast extent of his country. Grand, because of the achievements of his race, the sublime struggles and victories it has wrought. Grand, because of the respect all mankind pays to the title he holds. Grand because his citizenship is a standing rebuke to the pretentions of a governing aristocracy and a constant stimulus to the cause of democracy.

Citizenship is the essence of American freedom. It is the Alpha and Omega of the American system of civilization. It is the foundation stone on which are built all American institutions. Its first great object is liberty for the individual. Liberty of thought, of speech, of action, of worship, bounded only by one great principle, to-wit: My liberty must not interfere with the liberty of another. This principle compelled the creation of organized liberty in the shape of a constitution and laws, derived from citizenship itself, whereby the largest liberty consistent with the safety of the whole is guaranteed.

The American farmer from the foundation of the government has constituted the most important class in American society. The agricultural brain has been the parent brain of the nation. Itself the least cultivated, it has furnished the highest cultivation in statesmanship, in commerce, in law, and in art. It is the weakest element for its own interest and advancement of all the elements of our national life. Yet, out of it more than any other element has come the talent, the courage, the enterprise, and the patriotism that has made us the nation we are. The founders of this government were farmers: Washington, Adams, Jefferson, Madison, Monroe, Jackson, down to Webster, Clay, Lincoln, Grant, Garfield, and Sherman all came from the soil. What a magnificent array of genius in every department of human effort has come from this wonderful agricultural intellect in America. Europe furnishes no parallel to it. Why? Because there it is a government of the classes, not the masses. Take Germany as an illustration: The farm peasant there is the lowest form of intellectual life. Hundreds of years ago he was a serf bought and sold on the estate. He has had no intermarriage with other classes. The son of a farm peasant has married the daughter of a farm peasant for hundreds of years, until by the law of heredity there has come a fixed type, honest and industrious, but not intellectual. There are none of the heredities of intellect there. It is a splendid foundation stock, but, like sand, it needs mixing and tempering with other elements before it shall become good mortar. Life in Germany, as well as nearly all the rest of Europe, has consisted of a division into classes, with the farm peasant at the bottom. The result has been that there is a great lack of intellectual assertion in this class. There has been no breaking up vertically, by marriage, of these overlying stratas as in the United States. Here, the poor girl of yesterday may be the wife of the rich and powerful tomorrow, and the humble farm home may and indeed has, in almost every instance, sheltered the infant presidents of the republic.

The Standard of Citizenship

The theory on which American society and government is built is that of manhood citizenship. We are stockholders in this concern not because of birth, rank, or wealth. Manhood is the insignia of our title to the right to be called American citizens. That is the theory. It is a grand theory.

It represents the heart's longing. Aye, the heart's blood of thousands of brave souls in the past history of the world who fought against the tyranny of the few over the many. Our forefathers laid broad and true the foundations of our citizenship and they hoped that we, their children, would adhere to them in all interpretations of our duty. Although they came from every nation in Europe they scorned the idea of race or religion as a basis of political action; they built their citizen on the man alone. Are we following out these ideas? In the light of what is done today, how strangely the old history reads. Turn back to the old party conventions of fifty or seventy-five years ago. You do not read there anything about catering to the Germans, to the Irish, or to the Catholics or Protestants. There were thousands of citizens then of foreign birth but they had left the land of their birth behind them. They cast their fortunes here. No demagogue politician at that time dared to attempt to herd them off into race cliques. They

gloried alone in the name of American citizen. They were Americans not by birth because they couldn't help it, but by choice. They scorned any division of the people except on issues of principle. I wonder sometimes what these old German and Irish patriots would think if they lived here now? Imagine their astonishment at being urged to hang together on this or that question as Germans or Irishmen, not as American citizens. Then again these old time builders of our political house were Protestants and Catholics and every shade of religious belief. No politician would have long survived the storm of indignation fifty years ago had he appealed to his fellow citizens to combine as Catholics or Protestants, as Lutherans, Methodists, or Baptists in political action. Our forefathers had read history to some purpose. They knew the desperate wickedness of the human heart when enlisted in religious controversy. They knew that there is no selfishness like that of ecclesiasticism when in search of political power. They remembered that in all the great struggles in Europe for liberty, despotism had often found its strongest entrenchments in the church. They wanted to live in peace with each other.

They said we will make a government of the people and for the people. The people shall rule as a people and so they divorced church from state. What do you think these old fathers of the republic would say could they hear as we hear today, political appeals made to this or that class of people to vote together on religious considerations? Would they not ask: "Is this the citizenship we established? We knew nothing of any nationality save that of our country. We are amazed to find these heresies among you."

I can see this drift in the tide of our national life. Understand me, my friends. I am a profound believer in religion and in the true mission of the church, but I just as firmly believe in my country, and in all matters of citizenship I demand that we render unto Caesar the things that are Caesar's.

Again, when our fathers founded this republic, they never dreamed that men would measure their civic duties by the trade they followed. No greater lovers of agriculture ever existed than the heroes of th revolutionary period. Yet, what would be the astonishment of our fathers if they could attend some of the latter day political conventions and hear our farmers urged to vote on questions of national interest not as American citizens but simply as farmers? What would be their astonishment if they could attend some labor convention and hear the mechanics urged to vote on the same questions in the name of their trade?

Would they not wonder whence had departed the spirit of that citizenship which they bequeathed to their posterity? Suppose Hamilton, the father of American finance, could hear the question of money discussed from the farm standpoint alone as some of our Alliance friends are doing? Would he not say: "How can the money of all the people be considered and measured alone from the standpoint of a part of the people?"

Money is to the body politic what blood is to the body physical. If it be lowered in force and vitality in obedience to a clamor of the feet or the head, the whole body will soon be poisoned. The circulating medium, if it be sound and good, will visit every part and nourish every part.

Suppose some one should demand that the air we breathe should be modified from a farm standpoint. Every farmer would say: "What we need as farmers is what everybody needs; the best of air and no other. Give us honest air, pure air, and all we are honestly entitled to and no more."

All these questions of general public moment must be looked at and weighed in the light of our relations to each other as citizens, equal partners in one great concern, and not by the trade we follow. No man is honest or dishonest, ignorant or intelligent by virtue of his trade.—"By its own force the river gains the sea."

We have learned blacksmiths and ignorant lawyers, statesmanlike farmers, and foolish mechanics. Demagogues live by arousing the prejudices of men. Honest men appeal to their reason. In reason we shall live, but he who taketh the sword of prejudice shall die by the same weapon. The politician who endeavors to arouse our prejudices against other classes in society is trying to bind us hand and foot with the strong bands of our own folly.

I do not believe the farmer is naturally any more honest than other men but the opportunity of temptation is so lacking that it is greatly in his favor; hence, he is the least corrupted of any class of men; hence, he is the nation's hope when it comes to integrity of purpose. Hence, he is the great jury to whom the destiny of the nation must be referred.

The great crying need of the hour among the farmers of our land is an intellectual awakening, a deeper, a stronger, and more vital thirst for knowledge. Only by this can he become "as gods, knowing good from evil". He needs this awakening for his own good as a farmer that he may more truthfully discern the truths of agriculture; that he may elevate the dignity and standard of his calling, and enhance his respect among men; and, lastly, he needs this awakening for the sake of his country. To him does she look more than to any other class for the preservation of the great principles of American liberty; for the spread of the sentiment of patriotism; for the firm establishment of rectitude and integrity in the conduct of public affairs; for the steadfast upholding of the three great things which constitute the essence of American institutions: Manhood suffrage, an honest ballot, and free public education.

The Old Soldier—A Loyal Answer to His Country's Call

From address delivered at the G. A. R. Banquet in Faneuil Hall, Boston, Aug. 14, 1890.

When God sent forth the children of Israel on that wonderful journey, so full of result to all the subsequent destiny of men, he placed in the jealous care of a chosen few the precious ark of the covenant.

So stands the Grand Army of the Republic, today the chosen priesthood of American liberty, consecrated by the blood of no vulgar sacrifice, as the guardians of that precious covenant with freedom wherein lies the essence of our national life and destiny. It is not an empty purpose of self nor "the vain glorying of war's recollections" that brings us together.

These are Passover days, and we sing the song of our mighty deliverance, in the living hope that its music shall linger forever in the hearts of our children.

War is a terrible reality, yet it has always proved a wonderful developer of national character. Peace hath its corrupting influences no less than war. The spirit of sacrifice dies out, the sordid pursuits of gain absorb both day and night and we come to measure God, man, and country by the "guinea's stamp".

When the war of the Rebellion broke like a cloudburst on our sweet dream of piping peace, it found us asking the cowardly question, "How will this affect our business?"

In four eventful years a grand transfiguration of national character took place. We became a nation of soldiers, ready, without question, for any sacrifice in defense of the ark of the covenant.

We made solemn compact then with the whole world, that American institutions should "not perish from the face of the earth", but live forever, the hope of mankind.

Here broadens out the illimitable horizon of duty that surrounds the old soldier.

Why does he wear the blue? Why does he travel across the continent to kindle afresh the fires of liberty and of patriotism?

What was and is and will be the purpose of his being, till his last expiring breath?

Did the old soldier fight for an abstraction, for an empty symbol, for a mere piece of bunting? No! His mission was to defend and more broadly establish American institutions.

It was his noble task to deepen and enlarge the channel of American pride, to broaden American understanding as to the foundations of our liberty; in short, to establish the glory of American civilization.

He fought to put down caste, and build in its stead the spirit of true democracy.

The best and bravest blood of all nations leaped gladly to the sacrifice.

No narrow nativistic ideas prevailed before the cannon's mouth. The baptismal smoke of that mighty contention buried forever, let us hope, the malign spirit of race prejudice. The American flag, thank God, recognizes no distinction of blood, save that of sacrifice in its defense.

The old soldier believes in true American citizenship, and he makes no apology for calling it American either.

Abraham Lincoln

From address before the Loyal Legion, Milwaukee, February 6, 1895.

Certain men are like mountains. They possess the same scenic character, the same lofty headlands of exalted duty, the same fertile valleys of love and sentiment where humanity can live and find sustenance. Within their bold and rugged outline are spots of most exquisite beauty. Alpine violets and flowers of rarest perfume bloom above their timber line. They bear their own distinctive v dure. Only to him who shall explore them with heart loyal to the sacredness of nature, will th disclose the beauty of their heights and depths.

The gold and silver that all the world wa lie hidden in their inmost recesses. There is m tery and solitude, marvelous light and appall darkness, wonderful cataracts and delight stretches of quiet streams, eternal snow and m ing sunshine, untold wealth and the barrenness t starves; all these elements belong to great men great mountains. It is always refreshing to le the dull and dusty plain and seek renewed cour and vigor in their inspiring presence.

Thank Heaven for mountains that are like r and men that are like mountains.

Did we ever look at a mountain and call it a ward? Its greatness carries it beyond such c cism. Yet an ant hill fashioned in the same out would meet with contempt. Hence let both men mountains maintain the shape that God gave th and be content.

Since the earliest records of human achievem we note that the men who have been rugged, p erful, and ample, have become the repositories confidence and leadership among their fellows.

Lincoln, both physically, mentally, and mora was of this type. Contention, from earliest ch hood, with a most grudging fate, taught him w smaller souls rarely learn, to look lightly on h ship, to patiently endure what he could not c and make friends with poverty and privation. discipline of soul made him tolerant and cath He despised only human meanness. He was stinctively a man of reason. Because of this he broadly conscientious, not only morally, but i lectually. The intellectual perception of the son of things must be right or the moral per tion will be wrong. Hence he was first ethical then worshipful. Reverse the operation and have a bigot and a fanatic. Fortunate is the man soul that starts right, and from the fou tions of reason builds to himself a broade view of God and the obligations of life.

All enduring greatness must have an et foundation. The aim of all human effort, of ernment, of trade, commerce, politics, and its sultant law, must be to establish the right. man who makes of himself a part of this g scheme, and serves it grandly, shall partake o immortality. Such men cannot be judged wi microscope nor analyzed by the gravimetric pro

The Hindu said of such a man: "For it i cause of thy fullness that thou art become as and drink to thy fellows."

All true greatness can come only through sacrifice. Nature abhors cheap effort everyw She is laboriously perfect, even in the smalles tail. Before all heroic souls stands humar altar, on which must be laid all consideratio self.

Christ was not Christ in the fullness of his ship until the supreme moment of sacrifice when he could pray as man never prayed be "Father forgive them, for they know not what do."

There was much of the Christ-like quali Abraham Lincoln. He strove undaunted unti fulfillment of his sacrifice, and always with giving soul. For this the whole world has la memory to its heart of hearts. Liberty dwelt him as she does with the mountains; she fe soul; inspired his genius; entranced his v broadened his judgment; and finally, pointi the crouching slave, said: "Inasmuch as ye done it to the least of these my brethren ha done it unto me." This was enough for a history. Here again does the man and destin to a lofty altitude, and the dead level of h greed and base ambition sinks out of sight.

Said his Elder Brother: "He that would his life shall save it."

Lincoln was a born leader among men. T born faculty he added a wonderful comprehe of the true principles of Republican gover with the object of securing the best exercise ble of individual liberty, public order, and th motion of a sense of justice among men.

This comprehension is the basis of state ship. The man who possesses it in a large must have integrity and courage. "He who s ship must be obedient to the stars." He who lead the people must be faithful and honest himself, with principles, and with the peopl trust in him, and he must have staunch co How few cowards there are on the battlefiel how many in places of public duty! It is abou a Loyal Legion was formed whose purpose sh to encourage and commemorate exhibitions o courage and faithful adherence to civil duty it if you please the Lincoln Legion, and m his life and services a particular study for t

uragement of bravery in matters of public service. Lincoln was one of the greatest politicians of merican history. His forethought, skill, and abili- in the management of large masses of men, po- ically, was phenomenal. All these qualities are eded in politics, for they are the sum of all that lomon prayed for—wisdom. There have been too w imitations among the politicians who have suc- eded him, because Lincoln was honest, truthful, d far-seeing. It was the fashion in those early ys of the Republican party to strive for a prin- ple, to steadfastly maintain it, and wait for the ople to see it. There are a few still left in the rty who are so old-fashioned as to believe that is is the true political doctrine, and that a defeat defense of a righteous cause should never mean listment under the flag of the enemy.

As a politician Lincoln strove to establish confi- nce in his leadership by being honest. The politi- l profligacy of these times has come by abandon- g time-honored traditions and principles. Colton, the preface to Lacon, has aptly characterized our esent condition:

"In an age when free thinking consists not in e thinking, but in being free from thinking; ien independence of principle consists in having principles at all to depend on; when patriots will ld anything but their tongues; keep anything t their word and lose nothing so patiently as eir character—in an age like this, to improve is ficult; to instruct is dangerous, and he stands no ance of amending it who cannot at the same time use it."

Lincoln trusted the people, believing that when ey saw the right they would do right. He always rried that rare sense of being the servant of the ople, not their master. How different from the modern political boss. The low arts of lying and duplicity and all that "foul brood that gnaw from within out, leaving a man hollow to the whitewash" he knew nothing of. He reasoned simply and directly, and still how powerfully, to this proposition: "If I lead the people to the truth that shall make them free, I must be truthful to myself", and so he became the mouthpiece of God and the people.

We are in the midst of many troubles and serious misgivings. The labor question and all sorts of questions are resolutely clamoring for solution. Lincoln's way of solving the problem would be to accord justice. Greed, arrogance, money, and political bossism will never cement and preserve the American people as a nation. Simple justice will.

Let us have justice and honesty, rather than ostentatious charity and falsehood.

I will speak of one more feature of this wonderful character, and close. It was his harmonizing sense of mirth and humor. There is profound philosophy in this quality of mind. It is the sweetening and tempering quality. A sense of the ludicrous is always essential to prevent us from becoming ridiculous. Lincoln used this sense with rare skill, and in obedience to the widest reason.

What could be finer than his reply to a body of querulous critics who visited him in the dark days of 1864, to complain of the conduct of the war. Not a word of suggestion or help did they offer. Nothing but criticism. It requires but very little brains to be a critic only.

Lincoln listened patiently, and said: "My friends, you remind me of my old friend, Jack Armstrong, down on the Sangamon bottom. It was a time of unfathomable mud, and Jack wanted a drink of whiskey. He lived three miles from the grocery. Finally he managed to get to the drinking place and imbibed several drinks. After dark he started home and between whiskey and deep mud he was having a hard job to make any progress. There came up a terrible thunderstorm. It was pretty much all thunder. An occasional gleam of lightning would have been useful. A fearful crash of thunder came which brought poor Jack to his knees, and while in that posture, he thought he would pray, and his prayer, gentlemen, I commend to your attention:

"'Oh, Lord God, if it is all the same to you, I would like a little more light and less noise.'"

His illustration of the Democratic party trying to ride into power on the Pro-Slavery question was keen and apposite. It was this:

"In an early day a Methodist circuit rider came to a cross-road in Illinois where stood a typical country boy, barefooted, pants rolled up, one suspender, and shirt bosom open. The minister was mounted on about the poorest, weakest horse that had ever been seen in those parts. Addressing the boy, he said: 'My boy, which of these two roads will take me to Bloomington?' The boy paid no attention to the question; he had never seen a respectable man mounted on such a sorry steed before. The minister repeated the quotation. The boy looked up and replied: 'Who are you?' The answer came: 'I am a follower of the Lord.' 'Well,' said the boy, 'it won't make any difference which road you take. You'll never catch him with that hoss.'"

And so this rare man—rare in his genius, judgment, courage, honesty, and kindly humor, a perfect man—God gave us as our leader and examplar of American patriotism, American duty, American courage, and American faithfulness.

Letters and Telegrams Received

The world will be, in fact, a lonely place without e sage and wise counsel, the kindly thought, and e intensely human companionship of W. D. ard. I have known your father since 1882. I st met him in Meadville, Pa., when I was an offi- of the Pennsylvania State Dairy Association; d for that reason, instrumental in a way in nging him to our annual meeting, where he im- ted to us of the wisdom of his experience. You ow that I have known him in a more or less in- mate way from that day to this. You are to be ngratulated that his years have been many upon e earth which his God gave to him; and that, per- ps to a greater extent than any man who has ed through his period, his work was basic, con- uctive, and helpful. To that end, in my mind, has been one of the greatest citizens that our untry has ever produced. You may take it as a ttering unction to your soul, that in the midst of ife, political, financial, and otherwise, he had an e singly to the best development in every sense, t only in his individual county and state, but in great republic at large. I know that there are ny men throughout this great land of ours, who ll date the beginning of their success in life m the hour that they either heard from his lips read from his pen the sound preachments which their faces towards the ultimate goal of success.—E. E. CRITCHFIED, Chicago, Illinois.

⚜

I know of no more useful life in the Middle West n that just closed. Useful as were W. D. Hoard's vices in his public career, he rendered, in my nion, much greater services to his country as a e and courageous leader in its great dairy in- stry. There are thousands upon thousands of homes throughout the country, and particular- here in the Middle West, that owe more to Gov- nor Hoard's inspiration than to anything else. d the influences which he set in motion will con- ue indefinitely throughout all the years. One my most delightful memories is of the day I nt with him upon his farm a few years ago. His ge vision, his deep sympathy, his courageous in- tence upon what was right, greatly impressed then. I should not feel comfortable, if I did t pay this word of tribute to the noble career ich has just reached its earthly end.—GOVERNOR ANK O. LOWDEN, Springfield, Illinois.

⚜

The agricultural interests of this country have t one of the greatest, if not the greatest, think- along advanced lines in agriculture. His loss ll be a calamity to the nation. I always admired D. Hoard from the fact that he was not only an vanced thinker along the right lines, but he had e courage of his convictions to stand for the ht.—GEO. L. MCKAY, Chicago, Illinois.

I have known W. D. Hoard for many, many years and have been closely associated with him in the work that he has been doing and that he did do so well. I learned to love and honor him because of his simple, lovable personality, because of his rugged integrity, and because of his desire to help others and especially to point out to young men the way to success. Wisconsin has lost its foremost and most useful citizen. He has done a great work for the agriculture of Wisconsin—not only that, but for a more prosperous condition of farming throughout the United States and in the Dominion of Canada. He had a keen, analytical mind, a clear vision of what the future needed, and was anxious that his fellowmen should see the light of intelligent agriculture, know the truth about the dairy cow, and about all of the problems that concern those interested in a better agriculture. He will be greatly missed by his old friends and associates.—C. H. EVERETT, Editor, Wisconsin Agriculturist, Racine, Wis.

⚜

When the winged messengers of history are bringing to our attention the death of thousands of God's noblemen who have fought a good fight and died in their faith in the brotherhood of men, it is indeed an honor to any man that he has so lived that he will cause even a small part of this busy world to pause and say: "We shall miss him." W. D. Hoard has lived an honorable, a long, and a useful life, always working for the betterment of mankind, always holding aloft the highest principles. The whole dairy world will miss his wise counsels and ardent support of every dairy interest. He has fallen like the leaf after withstanding the storms of life, after changing into the beauty of a ripe old age—gone but not forgotten.—ALSON SECOR, Editor, Successful Farming, Des Moines, Ia.

⚜

He went down in defeat on his stand on the Bennett law. Today we all see the wisdom of his stand for that law. He was a man of broad vision and he was far sighted. Words are futile to express one's emotion and the most I can say is that William Dempster Hoard was a real man. It would be well for the world if many of us, who are now of age, would emulate him.—FRED ENGELBRACHT, JR., Berlin, Wisconsin.

⚜

I first met W. D. Hoard in the month of June, 1870, and have always looked upon him as a trusted friend ever since. In 1890 he was right and if the people then had heeded his advice there would have been less German propaganda abroad in Wisconsin at the present time. I considered your father the foremost citizen of our state.—JUDGE R. B. KIRKLAND, Jefferson, Wisconsin.

I knew that he had more than reached the allotted span of "three score years and ten", yet it is always a shock when you hear of the death of a friend. Few men have had an opportunity in their life time to erect their own monument to posterity. W. D. Hoard, however, was one of God's chosen few, who through his work for the farmer has erected a monument which will be imperishable for many generations in the farm homes of America. Through his example of integrity, loyalty, and clean living, he helped to make this a better world to live in and to prove to many men that manly virtues pay.—WALLACE C. RICHARDSON, New York City.

⚜

I deemed it an honor to be counted among his close friends. He was a princely man—a man above most men in both heart and vision. He performed his mission upon earth and has passed into that Shekinah where vision is unobstructed by material limitations. The ashes of materiality we commit to the tomb; but William Dempster Hoard, the self-conscious, intelligent idea of creative mind, lives on and radiates today even greater and purer love for his fellows than that which was his distinguishing characteristic while sojourning still in the "material temple". Would that we could all leave a record like his behind!—JUDGE GEORGE GRIMM, Jefferson, Wisconsin.

⚜

He stood for the best things and had vision. His life has been a most useful one and he will be mourned all over the nation. The good that he has done will live many years after you and I are gone. We both had great fathers and now they are both gone, leaving a rich legacy in good accomplished to us and likewise a great responsibility. Full of fruitage, they have gone to their rest. The splendid example they have set will ever be our inspiration.—JOHN WALLACE, Des Moines, Iowa.

⚜

It has always been a great source of satisfaction to me that the committee who had the matter in charge named Governor Hoard "the most distinguished citizen of our state". There is something about this that gives one some faith in humanity and that real merit will be recognized. Some of our worthless politicians have disgraced the fair name of Wisconsin, but Governor Hoard has left a golden star in the windows of many, many homes of this state and nation.—PROF. E. H. FARRINGTON, Madison, Wisconsin.

⚜

To have had the Governor as my friend has been one of the great inspirations in my life.—F. L. SLOCUM, New York, N. Y.

WILLIAM DEMPSTER HOARD

October 10, 1836 — November 22, 1918

THE man whose mind guided this page from its inception has been laid to rest. The great heart that pulsed with strength and devotion for all humanity beats no more. The voice that cheered his associates is silent. The lovable and fatherly spirit which radiated from his body is gone. His soul has passed to his Creator and his body has been committed to earth, but his spirit still lives on and the generations that are to be will be influenced and benefited by the work he has done. His vision was far seeing and of wide range. He was often disturbed because people failed to understand him and neglected to accept his principles and to follow them. It was his hope to have agriculture come to her rightful position and to have the farmers meet their opportunities. It was his intense desire for a better rural life, a better American citizenship, a better understanding of the teachings of Jesus Christ that urged and stimulated him to render a large public service. He loved righteousness, he loved truth, he loved all living creatures.

It pained him to see humanity suffer from its own ignorance because he saw opportunity for happiness and contentment for every living thing, if man would but follow the right principles in his living and right practices in his work. His tenderness extended to the soil, a common expression of his being: "Farmers have punished their soils." The phrase, "remember the cow is a mother and her calf a baby", characterizes him. In this statement he epitomized the essential conception necessary to successful handling of dairy animals. The dairy cow to him was not a dumb, insensate animal. She was a mother and, being such, was entitled to care and treatment becoming a mother. Thus he pleaded for warm barns, comfortable and clean stalls, pure air, and radiant sunshine for the cow and her baby. He urged that her feed be palatable, nutritious, and plentiful for he recognized in milk production the function of motherhood.

His work for the advancement of agriculture brought him world distinction and recognition, but some of his greatest efforts were made in behalf of better American citizenship. He believed no greater privilege could be extended to any person than the opportunity of becoming a good American citizen. He appreciated fully the meaning of being an American citizen, for he understood the price that had been paid for it; the struggle of humanity to secure liberty; the tyranny of kings; and he believed in the rights of the masses and not in the privileges of classes. When he saw men playing with this rich heritage,—men who lacked understanding of its meaning; men who would dispose of it for political aggrandizment, power, or gold; men who would rob the children of their rights—he rose with all his power against them. He suffered political defeat rather than yield to any course that interfered with the making of true American citizenship.

It took a great world's war to bring clearly before the people of Wisconsin and the nation that a common language was necessary and imperative to our country's welfare. He saw we could not build a country upon foreignism or a foreign language, but that we must teach our children so they would have a deep appreciation and a proper conception of their American citizenship. Those who opposed his election as governor for the second term, on the ground that he demanded English taught in all schools, have in late years come to him individually, in committees, and in groups to apologize. Such are the rewards of men who stand for the right, regardless of public opinion and temporary gains.

His messages to the people were carried by two weekly journals, the Jefferson County Union and Hoard's Dairyman. The Jefferson County Union was started at Lake Mills, Wis., in 1870 and in 1873 he moved it to Ft. Atkinson, where it has been published ever since. He started Hoard's Dairyman in 1885 and it now enjoys a world-wide circulation. He had no capital to back these papers, but he did possess something far better and more substantial. He had a vision and a sincere desire to render his fellowmen a true service. He saw the low standards of dairying followed by the farmers of Wisconsin; how lightly they considered their soils; their wrong conception of animal life and especially of the dairy cow; and the wrong attitude they took toward themselves and their calling. He never concerned himself about making money, but he was deeply concerned as to whether he was right. Making money did not mean success to him. He believed in the humanities and felt that good relations with his fellowman, leading people to knowledge, understanding, and right living, were the highest rewards of human endeavor. Thus he sought truth from every source, from the philosophers and the scientists of the ages; from the Hindu poets and the prophets of Israel; from the Master Teacher—that he might prepare himself as a safe and capable leader.

He was a profound student in many fields, but his special study of the dairy cow and all allied subjects made him the leader of dairy thought. He was not infrequently called "Dean of American Dairying". Over thirty-five years ago he analyzed the conformation of the dairy cow and pointed out how and why she differed in form from the beef cow. He not only studied her exterior conformation but went to the abattoir where he saw and measured her interior anatomy. This close study of the cow has never been paralleled. His investigation of dairy type and function led him to this conclusion: Temperament governs function and function governs form.

In his study he gave consideration to the product of the cow. Before the Agricultural Committee in Congress, when effort was being made to pass the Grout bill, which was drawn to protect the dairy industry and to force oleomargarine to sell upon its own merits, he said: "Butterfat is found in the milk of all mammalia. It is chemically and physically unlike any other fat in existence. It was designed by nature for the food and sustenance of infant offspring, having the most delicate of all digestion." The scientists have proven in recent years that his contentions were correct. It required a man of vision, a seeker of truth, and an indefatigable worker to unfold the secret processes of Nature, of the cow and her product. In his work he opened fields for the scientists, for his mind reached into unexplored regions, grasped the purpose of Nature, and came to conclusions marvelously accurate.

To the associates whom he called to his assistance in the publication of Hoard's Dairyman, his death means the loss of a dear, personal friend. To work with him was inspiration, to counsel with him was education. They count it a rare privilege to have been under his guidance and direction, and the inspiration of his life and works will be with them always.

Letters and Telegrams Received

Governor Hoard had the enviable pleasure of seeing the results of his work in every state in the Union. Without exaggeration, he has done as much good for the farmer and the breeder as any scientist or inventor. We know of hundreds of cases where struggling farmers were led by him into prosperity and happiness. We are glad indeed to pay our tribute to the wonderful sagacity, sound common sense, and ability to reach the understanding of both the farmer and the business man. There are very few that are gifted with this power of enlightenment, or, if they are, will devote their life to the amelioration of their struggling fellowmen. He was our teacher and we can thank him for a large fund of practical, sensible information that we would not otherwise have obtained.—ROBERT W. CHAPIN, Chicago.

⚜

In the hour of your bereavement you should find comfort in the knowledge that the community owes a debt of gratitude to your father for his wise and sympathetic leadership; the state for his constructive statesmanship, and the nation for the first exponent of true Americanism. No other man has done so much for the upbuilding of agriculture and rural life in this state, none other has been so loyal and untiring a supporter of higher agricultural education or has shown more wisdom and personal sacrifice in his devotion to the "little rural school". Had the state accepted his leadership under the Bennett law it would not have had so much hyphenated Americanism with which to contend during the present war.—K. L. HATCH, College of Agriculture, Madison.

⚜

The members of the faculty of the Wisconsin College of Agriculture desire to express their sincere sympathy and sense of personal loss in the close of the distinguished career of Governor Hoard. We deeply appreciate his devoted efforts in the upbuilding of this college and recognize h invaluable services in the advancement of ag culture. As the apostle of scientific dairying h influence has been world-wide. In his passing t farmers of Wisconsin and of the nation have l a most sympathetic friend and leader.—WISCONS COLLEGE OF AGRICULTURE, Madison, Wisconsin.

⚜

In the dairy world, former Governor W. Hoard was a many-sided genius. A sturdy pione he blazed new paths through many trackless f ests. A very resourceful, self-reliant pilot, navigated uncharted seas. A towering charact he caught the early gleams of the ever rising lig of dairy knowledge and reflected them to his f lows. A unique individuality, we shall never s his like again. A self-made man of internatio fame and friendships, his death will be mourn by many thousands of people as that of a perso friend.—J. Q. EMERY, Edgerton, Wisconsin.

⚜

The University of Wisconsin expresses the de est sympathy with you in your great loss. We j with all citizens of the state and nation in recogn ing the inestimable public services of Gover Hoard and in rendering honor to his long life of selfish and beneficial activity. We remember w peculiar gratitude his innumerable services to University, both as one of its regents and as constant friend and counsellor.—E. A. BIRGE, A ing President, Madison, Wisconsin.

FUTURE DAIRYING

An Illinois subscriber requests our opinion regarding the European demands for dairy cattle after the war and principles and practices of dairying which should be advocated and carried out at the present time. His questions and our replies are as follows:

1. "Will there be a demand for dairy stock after the war from European countries?"

We believe there will be some demand for dairy stock from Europe after peace is declared. We feel reasonably confident that Europe's demand for cattle will not be as large as some persons expect. We have good reason to believe that exaggerated reports have been made of the depletion of European herds. There are sections, of course, where the dairy cattle have been destroyed and, on the whole, there is a decrease in the cow population, but not to the extent that some would have us believe. The large factor in decreased milk production of Europe, we believe, is due to the lack of forage. Some months ago there was a Belgian commission in Washington trying to locate dairy cattle free from disease and that could be purchased. This commission was looking for good cows. We believe the demand for cattle will help to keep the dairy cow market in a healthy condition and that dairymen raising good cows are assured of good prices for years to come. However, it is our opinion that the foreign demand for dairy cattle will not be an important factor.

2. "Will there be plenty of milk and dairy products to supply our export demand?"

We do not know, but we think if the prices for dairy products are sufficiently high that the European countries will have no difficulty in obtaining an adequate supply of dairy products. It may be said that this is a matter which is of no serious concern to the American dairy farmer when we look at it purely from a business standpoint. If there are not enough dairy products produced to meet the demands of the European countries, it will work to the advantage of the American dairy farmer, providing him opportunities to increase his herd and will assure him a good remuneration for dairy products. We believe we can increase the production of milk 20% if the dairy farmer will give his herd proper attention. They will likely do this if the prices of dairy products are sufficiently high to reward them for extra effort.

3. "Should the poor cow be weeded out and sold to the butcher the same as they have been in the past?"

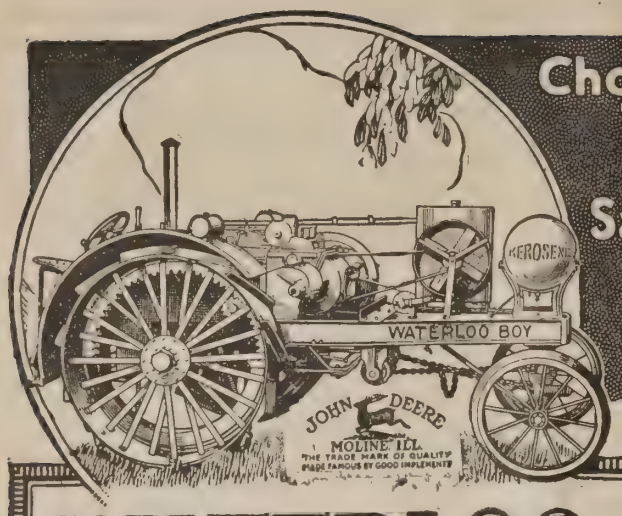
Yes. Why not? There is no good reason why any farmer should keep an unprofitable cow and especially now when there is a shortage of feed. Every thinking person has been advising the farmers for years to weed out the unprofitable cow, and now we think we can emphasize this because the prices for beef are high and feeds none too plentiful. Those who advocate the keeping of all cows feel that it would be a calamity if all the unprofitable cows were sold. It would be, but there is no danger of any such thing taking place. Our effort, the effort of experiment stations, and everybody engaged in teaching is trying to lift a few more above the average. If we can at this time pull a few more men above the average practice, we believe it will work to the advantage of dairy farming and we do not believe that we should neglect the opportunity.

4. "Is this the proper time to appeal to the dairymen and farmers to preserve the dairy cow, improve her stock, and help her to produce more and better dairy products?"

This is an admirable time to appeal to dairymen to improve their herds. We feel certain that the prices for dairy products during the next five or ten years will be proportionately higher than other farm products. Without question, the European herds have been reduced in numbers, but not to the extent which some have claimed, but the decrease has been sufficient to bring about a shortage of dairy products and during the time that these herds are being replenished, these countries will come to America for dairy products. This will have a tendency to advance the prices for dairy products, as will also the new markets opening up in South America and the far East. In addition we have a campaign, which is rather universal, encouraging a larger consumption of dairy products in this country, and this is going to have a material effect for the next five to ten years, and perhaps longer. As a nation, we do not consume over one-fourth the amount of milk we should and not one-half the cheese. Instead of using the products of 23,000,000 dairy cows, we could easily use the products of 50,000,000 dairy cows if people were advised as to the importance and food value of milk and its products.

If we were to sum up our conception of what should be done at this time to improve and develop the dairy industry, it would be this: Proceed to encourage dairy farmers to improve their herds by the purchasing of a good dairy bull. Urge them to feed and care for their cows better and to test them in order to determine those that are profitable and unprofitable and to help them understand the principles and practices necessary to follow in order to make their herds profitable. Encourage the selling of the cow that will not produce milk at a profit. Point out the necessity of raising a larger amount of the feed on the farm that less will have to be purchased. This means the growing of more legumes and the building of more silos. Encourage the farmers themselves to consume more dairy products, pointing out the food value of milk and cheese and the necessity of butter.

In other words, proceed to advocate sane dairy principles and practices, the same as we have been doing before we entered the war. If we do this, we are sure that we will make no mistake. If we attempt to deviate from principles which lead to the development of our dairy herds or advocate practices which are not profitable, then we will be treading upon unsafe ground which will lead to confusion and will make the dairy farmer distrust our statements.



THE MEASURE OF A COW

The work a cow does in her life is her true measure. Every breeder appreciates the cow that reproduces regularly; the one that produces milk for eight or more lactation periods and transmits to her offspring the same powers. It is not enough that a cow makes two or three good records, especially for a week or thirty days. Constant yearly production, the average production for a series of years, even though it be not phenomenal, is what should be demanded of the dairy cow.

It is well enough now and then to prepare a cow for a big record by permitting her to rest for a long time and to feed her heavily during this resting period that she may be fattened. The record made by such fitting does not measure the inherent and steadfast qualities of the cow. It simply shows what can be done with feed and skillful handling. The cow selected for such a test is usually well bred or she could not do her part. This system of handling cows has had its advantages, for it has demonstrated clearly the importance of good feeding and right handling.

We are not unmindful of the harmful practice of permitting a cow to loaf the larger part of the year in order to make her fat and then force her by various schemes and methods to make a large record soon after she freshens. This system has taught us certain lessons which are valuable, but there is little to be gained by continuing in such practices. The scientists have shown us through their investigations the effects certain feeds have upon the development and function of the animal. Every breeder who desires to develop a cow of large and steadfast production and capable of reproducing herself regularly has been interested in the results obtained through certain feeds.

Enough work has been done to lead every thinking breeder to believe that with the right mixture of feeds our cattle will not only grow in producing qualities and reproduce more regularly, but the number of lactation periods will be extended. There must be a true conception of what constitutes the real measure of a cow and a thorough understanding of the factors influencing her development before the greatest progress in breeding can be made.

Choose the Tractor with a Satisfactory 4 Year Working Record

WATERLOO BOY

Original Kerosene Tractor

Pin your faith to the tractor whose record you know. Four years of consistent success in the hands of thousands of American farmers have established Waterloo Boy supremacy.

Waterloo Boy users have demonstrated its ability for ample power in all work, under various soil conditions; its average consumption of less than 2 gallons kerosene to the acre of plowing; its threshing cost of 15c per hour. Waterloo Boy users plow from 8 to 12 acres per day and get special acreage advantages in other farming operations.

They have found this reliable Three-Plow Tractor easy to operate, strong and durable in construction, and fully up to their expectations in performance. Dust-proof gear construction, complete accessibility, automatic lubrication and reliable ignition insure easy and continuous operation. Every part of the Waterloo Boy performs its service.

Its Record Is Your Guarantee

Get these facts from our users themselves. They spell Waterloo Boy success for you. Many bona fide voluntary expressions of our users' complete satisfaction are contained in our catalog. Consult this book before going further into the tractor question. It will save you time, labor and money to buy a Waterloo Boy. Write for our literature today.

Officially Testing Dairy Cov

J. R. DICE, MISSOURI

THE official testing of dairy cows has become universal throughout the United States. The value of a pure-bred animal is now largely determined by its records or the records of its near relatives. A pure-bred cow, even if she is a good individual with plenty of size and vigor, no longer has an equal chance with her tested sister, for now every buyer pays considerable attention to records of production, regardless of the section of country from which he comes.

The question confronting all dairymen at present is whether to test now or wait until after the war. Feed is high and hard to get. Labor is so scarce that it is hard to get the necessary farm work done and test supervisors are also expensive and at times unobtainable. On the other hand, breeders can well ask themselves if they can afford not to test. Men of experience know that no one can tell at what age a cow will do her best. They know that many young cows meet with accidents that may end their career as producers or cut down their records, and they also know that many such cases will spoil the pedigrees of several animals in their herd. Another important reason for testing is that it now costs so much to raise a calf that unless it is backed by records the animal when sold will not bring enough to pay a profit over its cost of production. The sale of bull calves is one of the important items in determining the profit from a pure-bred herd. Because the number of bull calves raised has been cut down by war conditions there is a greater demand than ever for good calves with good backing at record breaking prices.

The beginner should know that it usually practically doubles the value of a herd to test it and many cases could be mentioned where one member of the herd by making a good record has become more valuable than the entire herd was before it was tested. It would, therefore, seem that we cannot afford not to test our good cows.

Good cows are the first requirement for good records. It is usually possible to pick out a good cow but all experienced dairymen know that you never know what a cow will do until she is given a chance on official test.

No one should be fooled into thinking that present day records are made by using dope or underhand methods. Unfortunately there are many who are not willing to give the dairy cow credit for the wonderful work she does. It is improved breeding, feeding, and management that have made recent records possible.

Some breeders hesitate to start testing until they have their stables arranged to provide box stalls, etc. Box stalls and the more expensive equipment are not necessary and some do not prefer them. Many of the prominent breeders do not keep their test cows in box stalls. One 40-pound record was made by a Holstein cow last winter after she had been taken out of a box stall and put in her regular stanchion.

Fitting the Cows

A cow that is to be tested should be given a rest and fitted so that she will do her best. The expense of testing a cow is usually not justified unless she is in condition to have a fair chance to make a good record. There are so many high record cows that a breeder cannot afford to be satisfied with anything less than the best a cow can do.

It is very desirable to have a cow dry about three months previous to freshening. Usually there is no advantage in giving a cow a longer and many do not have her dry long. If the cow is giving a good of milk, she can be quickly drie by putting her on hay for a short and milking her irregularly, on day at first and then every two Avoid cutting the feed down gra ly as a good cow will readjust he and continue to give milk. Some that are not persistent milkers dry up on hay and ensilage. Th der should be carefully watche this time and any tendency to should be taken care of. Rubbin udder thoroughly with camphor lard will usually be sufficient. camphor also has a tendency to check the milk flow.

The cow should have little, if exercise if she is being fitted short time test. For a long tes ercise is more desirable. Thus, rule cows should not be fitted on ture. Daily grooming is very de ble. If possible, weigh the cow week so as to know how she is ing.

The fitting ration fed should b tening so that the grain mi should contain a large part of feeds and linseed oil meal. A that has been used for years is up of equal parts by weight of bran, ground oats, linseed oil and corn meal or hominy feed. is especially good to use when a cow for a long test. For short the following mixture or some similar is preferred: 2 parts li oil meal, 2 parts hominy feed o meal, 1 part wheat bran. Groun should be added to this for he Some prefer to feed this with pulp soaked with water and mo and fed in the form of a mash. all of the grain the cows will ea a relish which will be from 15 t 30 pounds of grain per day, de ing on the size and capacity cow.

In addition to the grain ration ensilage, corn ensilage pref beets or beet pulp, and feedin lasses, if obtainable. About a of molasses per day can be fed. ver or alfalfa hay are best unle bowels become too loose and mixed hay or timothy may b ferred.

Two weeks or ten days befo cow is due the grain ration sho changed by reducing the amou to eight or ten pounds per da feeding equal parts of bran, g oats, and linseed meal or a light ration.

If for any reason the cow yo to test is not dry four or five before she is due to freshen, try to dry her off. Feed her all feed she will take and let he what milk she will at irregular ings. When the cow is due, bowels are not loose, either fee ty of beets or give salts to corre condition.

When the cow freshens she such good condition that she ne tle feed. Feed her nothing but age the first day. A quart or m bran will do no harm. Let he all of the water she wants, bein ful not to allow her to drink too at one time. Very cold water jectionable. Start in the sec third day feeding the light gr tion the cow was getting just she freshened, and, as the co of the cow improves, gradua her on a test ration.

The udder of the cow will ce cake but rubbing it, either dry lard, will usually be all that necessary. Do not use camp similar medicines as they hind

...retion. It is best not to milk the ...der out clean the first day as a full ...der tends to prevent milk fever.

As the cow becomes normal and her ...petite improves, the grain ration ...ould be gradually increased. A ...nd a day increase is the rule most ...nmonly followed. A mature cow ...t has been on heavy feed during ...t fitting period will usually eat 20 ...unds of grain per day without any ...uble. After that amount is ...ched, the feeder should proceed ...efully.

Test Rations

A careful study of the test rations ...l to high producing cows in recent ...ars shows that practically all of the ...ions are very similar. The follow...ng are good examples:

The Pine Grove Farms' rations: ...l. 200 lbs. wheat bran, 200 lbs. dis...ers grains, 125 lbs. ground oats, ...5 lbs. gluten feed, 80 lbs. linseed ...al, 100 lbs. cottonseed meal, 15 ...l. charcoal, 10 lbs. salt.

...2. 100 lbs. ground oats, 100 lbs. ...an, 100 lbs. hominy feed, 100 lbs. ...seed meal, 50 lbs. cottonseed meal, ...t, and charcoal.

These grain rations are typical of ...e rations fed cows on short test.

Duchess Skylark Ormsby, the high...producing butterfat cow for a ...ar, was fed the following grain ra...n:

...100 lbs. bran, 100 lbs. ground oats, ...lbs. distillers grains, 100 lbs. brew...grains, 60 lbs. linseed meal, 60 ...l. hominy feed.

Hominy feed is universally pre...red to corn meal for feeding cows ...test. Some prefer to not mix the ...tonseed meal in with the ration but ...d it separate. Where this is done, ...m one to four pounds per day are ...l, depending on the condition of ...e cow.

Distillers grains are now off the ...rket so that a substitute will be ...essary for this very valuable feed. ...fessor Humphrey of the Wisconsin ...tion suggests that gluten feed with ...to 15% germ oil meal will make ...best substitute. Bran and linseed ...al will also help take its place.

The cow should be watched con...ntly. If she does not like her feed ...to find out what it is she does not ...e and take it out of her ration. If ...e goes off feed or leaves a part of ...r ration, take it away from her and ...not let her muss it over. The next ...d give her half of the usual ...ount fed and in most cases she will ...me back on feed all right.

The amount of feed that the cow ...l eat will depend on each individual ...r. A cow will usually eat in addi...n to her grain ration from thirty ...sixty pounds of roots, twenty-four ...thirty pounds of ensilage, twenty ...forty pounds of dried beet pulp af...it is soaked, and from ten to fif...n pounds of hay. Divide the day's ...d so that the cow will receive an ...al part of everything except the ... at each milking time.

The one time in her life that a cow ...uld have her own way is while she ...on test. The late E. H. Dollar ...ed the skins off the beets he fed ...tiac Rag Apple because she would ... eat them with the skins on but the ...rd she made and the price he re...ed for the cow justified the trou...

The following digestive tonic is a ...d one to use if your breed associa... allows it to be fed: 1½ parts ...ber salts (dry sulphate), 1 part ...rbonate of soda, 1 part powdered ...tian, 1 part powdered nux vomi... This tonic is bitter and some ...s do not like it at first. Three ...espoonfuls per day is the dose but ... than that amount can be fed to ...antage.

The stable should be kept as quiet ...ossible and the cow should be left ...e between milkings after she is ...med. The temperatures of the stable should be rather cool, about fifty degrees, and the ventilation should be good. Some prefer to keep a light blanket on the cow.

The beginner may be advised that by manipulating the feed, feeding large amounts of some concentrate, or by sudden changes, he will be able to increase the fat test. Such changes may affect the test temporarily but it is just as apt to cause the fat test to go down as it is to raise it. The safe rule to follow is to make all changes gradually.

The only way to make known your herd's ability to produce is to test your good cows and the only way to learn how to test is by testing. There seems to be every reason to believe that the breeder who continues to test during these unusual times will be fully repaid for his extra effort.

Feeding Velvet Beans in Alabama

HOARD'S DAIRYMAN:—Many use the velvet bean with the pod and bean ground into a meal, and a great many others use the unground beans in the pod, but usually soak them 8 to 10 hours before feeding. By doing this the bean is softened considerably and is somewhat more palatable than when fed dry.

A mixture that is used by many of the dairymen is one composed of 100 pounds cottonseed meal, 100 pounds corn and cob meal, and 200 pounds velvet beans in the pod. The mixture of cottonseed meal and corn and cob meal is sprinkled on the soaked velvet beans in the pod. Some cows do not seem to relish the velvet bean at first; others seem to prefer it to any other form of grain. To those that do not seem to relish it, it is a good idea to feed only a small ration of it at first, gradually increasing the quantity until the full amount is being fed.

Many who do not have the corn and cob meal make a grain ration composed of velvet beans and cottonseed meal, using in the proportion of one pound cottonseed meal to three pounds velvet beans. The first named mixture is more desirable than this one, probably more because of variety than anything else.

Another good grain ration that has proven satisfactory to those feeding the velvet bean is one composed of 100 pounds cottonseed meal, 100 pounds wheat bran, and 200 pounds velvet beans. Of course, this mixture is not used to any very great extent now because of the high cost and scarcity of wheat bran.

Still another mixture that is proving quite satisfactory is one made up of 100 pounds cottonseed meal, 100 pounds peanut meal, and 200 pounds velvet bean meal. It is the experience of dairymen that this mixture is better than where 200 pounds of the cottonseed meal or the peanut meal is used along with 200 pounds of velvet beans, probably on account of variety.

Few dairymen in the section where velvet beans are growing, especially if they are grown on their own farms, mix up a grain ration without using a large portion of this bean. It is not so palatable as cottonseed meal, peanut meal, or other grain rations, but it runs around 18 to 20 per cent protein and very materially lessens the cost of the grain ration when it is grown at home. In feeding this mixture, from two to two and one-half pounds of velvet beans in the pod are considered the equal in milk producing value of one pound of cottonseed meal or peanut meal. Without question the velvet bean will continue to be one of the important ingredients of grain rations for the dairyman, especially for those who grow it at home.

Holder of World's 13-Year-Old Record. Owned at Hill Den Farms, Dixon, Ill.

Makes World's Record With Sharples Milker

The Sharples Separator Co.,
West Chester, Pa.

Yes, we copped one of the Association prizes with "Leda Johanna Rue". She holds a world's record for a 13-year-old cow and it takes a real dairy cow to get in on any of the Asso. prize money. This cow was milked with the Sharples Milker four times daily the first eight months, and three times daily the last four months. The last milking of the 365 days, or the thirteen hundred and thirty-fifth milking, she gave 18.2 lbs. of milk, and was milked with the Sharples Machine. She has freshened since and is again being milked with the machine and hitting the same pace. The Sharples Milker is the *only* machine. I would rather part with this cow than the machine, if it came to a choice, although the cow is worth five times the price of the machine.

Very truly yours,
CHARLES R. HEY, Manager,
Hill Den Farms Company,
Dixon, Ill.

SHARPLES MILKER

"The Only Milker With Positive Squeeze"

Mr. Hey's letter speaks for itself—Sharples Milker was used on this cow after she had been milked by hand for years. But it was not until the Sharples Machine was used that a world's record was made. The Sharples positive squeeze and massage action on the teats made it possible to milk faster than others could and also insured the health of the teats and udder.

No other milker has this squeeze or massage, and Leda Johanna Rue is the first cow to make a world's record while being milked by a milking machine. Sharples Milker is an efficient and labor saving milker, whether on the average or the finest pure-bred or highest producing cows.

Write for information on other day-to-day achievements of the Sharples Milker. Address Dept. 10.

Wisconsin's Most Distinguished Citizen

IT has been given to few men to receive during their lifetime such generous recognition as was awarded W. D. Hoard. Conspicuous among these, and confirming in a sense what are personal testimonials, was his selection in 1915 as Wisconsin's most distinguished citizen. At the request of President Charles C. Moore of the Panama-Pacific Exposition, Governor Philipp appointed a committee to select the citizen of Wisconsin who had rendered the most signal service to his state.

The committee selected by Governor Philipp was able and knew the men who had rendered the greatest service to the state. The committee included a preacher, a lawyer, a doctor, an agriculturist, an educator, a manufacturer, and a railroad man. Their selection was an official act and in no way a personal matter. The honor of receiving such high recognition from the hands of the leading men engaged in various fields of endeavor was highly complimentary to him.

The official document which was presented to Mr. Hoard by Governor Philipp reads as follows:

UNITED STATES OF AMERICA

The State of Wisconsin

EXECUTIVE DEPARTMENT

MADISON, WISCONSIN, NOVEMBER, 24, 1915.

HONORABLE W. D. HOARD,
FORT ATKINSON, WISCONSIN.

MY DEAR SIR:

Under date of June 14, 1915, I received the following communication from President Charles C. Moore of the Panama-Pacific Exposition at San Francisco;

"It is the desire of the Panama-Pacific International Exposition to pay a signal compliment to the State of Wisconsin by designating a Special Day on our Calendar, in honor of one of the citizens of your State especially distinguished in statesmanship, literature, art, science or invention, etc."

The letter suggested the appointment of a committee to make the selection of the citizen upon whom the honor should be bestowed. In compliance with this request I appointed the following committee:

Reverend E. G. Updike, Madison, Wisconsin.
Theodore O. Vilter, Esq., Manufacturer, Milwaukee, Wisconsin.
Honorable George H. Gordon, Attorney, La Crosse, Wisconsin.
Professor L. D. Harvey, Menomonie, Wisconsin.
Doctor H. A. Sifton, Milwaukee, Wisconsin.
A. E. Manchester, Esq., Supt. of Motor Power of the C. M. & St. P. Ry. Co., Milwaukee, Wisconsin.
Charles L. Hill, Esq., Agriculturist, Rosendale, Wisconsin.

To the above committee I submitted a copy of the letter which I received from President Moore of the Exposition, with instructions that they proceed to confer the honor upon the Wisconsin citizen whom they regarded as being most worthy to receive the same. The subject was widely discussed by the public press and many names were suggested to me, which I transmitted to the committee for its consideration. Under date of November 3, 1915, I received the following communication:

MILWAUKEE, WIS., Nov. 3, 1915.

GOV. EMANUEL PHILIPP,
MADISON, WIS.

MY DEAR SIR:

Your committee to name the most distinguished citizen of Wisconsin has just concluded its conference and the honor falls on Ex-Governor W. D. Hoard. The vote was made unanimous.

Yours very truly,
E. G. UPDIKE, Chairman.

It is the purpose of the officers of the Exposition to invite you to San Francisco and there confer upon you fitting testimonials. I wish to add my hearty approval of the choice made by the committee. In the long life that it has been your privilege to spend in Wisconsin, no man has rendered a more useful service to our citizens. Therefore, as Governor of the State it gives me great pleasure to greet you as Wisconsin's foremost citizen and I can give you the assurance that the action of the committee in selecting you for this honor is universally approved by the people of our State whom you have served so well.

I submit to you this testimonial of your fellow citizens as a recognition of the value of a long and useful service to our State and Nation.

Respectfully,
EMANUEL L. PHILIPP,
Governor.

A Letter from C. P. Goodrich

HOARD'S DAIRYMAN:—I knew Wm. D. Hoard many years ago, knew him when he lived at Lake Mills, used to hear him talk and sing and tell stories in a delightful way.

After he came to Fort Atkinson in 1873 I became intimately acquainted with him. He was enthusiastic in urging men to be better farmers and better dairymen; dairying was his specialty. I was trying desperately to succeed in the dairy business so that whenever we met our talk was mainly on that business. He quite often came out to my place, nine miles west of Ft. Atkinson, with a horse and buggy, over roads which at that time, to say the least, were not very good. Sometimes he would stay over night. Of course, we had fun—stories, music, and singing, but the main thing was dairy talk.

We discussed the subjects of how to get better dairy cows, how to feed and handle them better, and how to handle the milk and make the butter, and how to market the product to get the most money. We talked of how to improve the breed of cows and as one of the results of our talk I got my first pure-bred dairy sire.

He tried very hard to help the poor, hard working, unsuccessful farmer, and the poorer and more ignorant he was the harder he tried. He did not do these things to show off his superior knowledge; he did them to help others from the kindness of his heart. He went out quietly to some farm and advised and helped the owner to adopt better methods. Many a man was benefited in this way, of which the public knew nothing. He didn't do it to show off, but to do good.

I will relate one instance of which I happened to know. A poor, hard working man came into Hoard's office looking much downcast. Hoard says: "How you getting along, Hans?"

"Not very well. I owe much for my little farm and I can't get enough to pay the 10% interest."

"Have you got any cows?"

"Yes, I got four."

"Don't you make butter?"

"Yes, some, but that is only 12 cents a pound and then I have to take goods from the store. I get no money for it." (This, mind you, was before there were any creameries in the country.)

Hoard says: "I'll come to your place tonight."

He did, and talked with him about feeding and watering his cows and many other things and even helped him milk. He arranged to set the milk in the best way he could for getting the cream. He went away, but said: "I'm coming again every day. I'm going to make some butter for you. He did, skimmed the milk, ripened the cream, and churned the butter. He used some good dairy salt and butter color. The butter Hans' wife made had been white. He told him to get a butter tub, in which Hoard packed the butter and shipped it off to Chicago to market. It brought 25 cents a pound. A more delighted man than Hans was I never saw. He said, when he got that money: "Meester Hoard, you have saved me. Now I can pay for my farm." And he did and became a prosperous dairyman.

This is but one instance. Many more might be told if the facts could be got at where Hoard had visited individual farmers in those early days and helped them to be more successful. But, of course, they would not all admit it for they thought it was all by their own wisdom that they succeeded. Still there are men yet alive who will now admit that in those early days William Dempster Hoard helped them.

C. P. GOODRICH.
Ft. Atkinson, Wis.

A Friend's Appreciation

HOARD'S DAIRYMAN:—For m
than thirty-five years, the writer h
a semi-editorial connection with
Dairyman, and mixed in with th
years Governor Hoard and I cros
and recrossed each other's paths
the lecture field; always with

The Coming of Christ

W. D. Hoard believed in Jesus hrist and followed His teachings. He uld tolerate no creed or preacher at distorted the teachings of the aster. His strong passion for the uth and truthfulness made him ab- or the demagogue no matter what sition he occupied.

We found among his private papers poem endorsed in his own hand with ese words: "A splendid poem on the oming of Christ by a Welsh girl." The poem is as follows:

ey cry: "He comes!
e signs are sure; all lands are armed for war,
e mistic number is fulfilled.
comes!"
e answer: "Oh, that He would come.
e want the Christ.
e want a God to burn the truth
resh upon the forehead of the world.
e want a man to walk once more among
e wrangling Pharisees; to drive the beasts
d money mongers from the temple courts;
bring the gospel back again, and prove
w all unlike the churches are to Christ.
e want the Christ again to tell the "saints"
eir sins: that they were sent to preach the works of peace,
d they have filled the world with war of words;
at they were sent the messengers of love,
d they have driven love out of their creeds;
at they were sent to teach men not to lie,
r tremble when their duty led to death.
, for the Christ again!
, He would dare to tell the churches how they lie and cant;
d talk of serving God, and serve themselves;
d talk of saving souls, to save their "cause";
d pare and narrow God's divinest truth
til a man can hardly be a man
d member of a church.
ready Christ is coming.
ar ye not the footfalls of the Lord?
tramples down the cruel hedges men have built about
e gate that leads to Heaven.
rends the creeds.
d gives their tatters to the merry winds.
does not come as bigots prophesy
choose a handful and to damn the rest;
found a Jewish-Gentile kingdom here
d roll the world into the Past again.
comes the Spirit of a Riper Age,
en all that is not good or true shall die;
en all that's bad in custom, false in creed,
d all that makes the boor and mars the man,
all pass away forever.
s, He comes to give the world a passion for the truth,
inspire us with a holy, human love,
make us sure that ere a man can be saint, he first must be a man.

[This poem was given the editor of e Golden Rule about twenty-five ars ago by a gentleman who got it a little bookstall in Lianelly, Wales. was written by a strange looking rl of eighteen who was pointed out "a dreamer" and said to be crazy the village folks. The poem was ritten in 1868.]

Farmers and the Red Cross

There is no person anywhere who nnot be of some use to the Red oss and the idea which the Red Cross represents. The most immediate opportunity and the one which every man, woman, or child who is interested ought to take advantage of is the chance to become a member of the organization during the Christmas Roll Call. At this Christmas time there is no expression of the Christmas spirit of good will to men more effective than adding your name to the list of those who are joined together in the mission of mercy which the Red Cross represents. Especially is it the duty of those who are somewhat remote from the battlefield to get the direct contact with the work of the Red Cross that is felt by being a member of the organization. The farmer or the farmer's wife, his sons and his daughters, who can picture the bitter suffering of the French or the Belgian farmer who has been thrust from his homestead by the invader and who has seen his fields torn by big guns and his trees ripped up by shell fire, knows what Red Cross help means to those sufferers and can appreciate a chance to share in the work of making their lot more bearable. Much of the Red Cross money spent in France and Italy and other foreign countries goes to the relief of refugees from farm regions.

There are other ways for the farmer and his family to help the Red Cross. Home service is becoming one of the most important and far reaching phases of Red Cross work. It is the effort of the millions of Red Cross members to see that the standards of

CAPTAIN ARNET AND MRS. ATHERTON SMITH DISCUSSING FARM WORK WITH CRIPPLED FRENCH SOLDIERS AT AMERICAN RED CROSS FARM AT LE LIEGE FOR THE RE-EDUCATION OF MEN MUTILATED IN THE WAR

family life in America are not lowered by the war, that no soldier's or sailor's family suffers for lack of money or lack of friends while he is away fighting for his country. In that phase of Red Cross work farmers and their wives cannot only sympathize but can actively help.

The problem of home service is especially difficult in the rural districts. Where distances are great it is often hard for conscientious home service committees to keep in touch with all the soldiers' and sailors' families and make sure that nothing is left undone that will make them happier. Every farmer's family in the United States knowing of another family whose existence has been made hard by the departure of a man to the battle front can help the Red Cross by seeing that the nearest home service section is informed of the circumstances. Red Cross home service does not intrude or insist upon its help nor does it encourage anyone to intrude in its behalf. It is a great organized spirit of neighborliness to which anyone can turn who needs a friend.

By joining the American Red Cross now, by giving generously according to their means, by giving home service in their own communities their understanding and co-operation, every farmer and every farmer's family in the United States can be of direct help to the great ideal of humanity which the Red Cross is trying to serve.—C. S. CLARK, Secretary Red Cross Christmas Roll.

The New York Butter Market

NEW YORK CITY, Nov. 26—High quality creamery butter continues in exceptionally strong demand and buyers seem very willing to pay the extremely high prices that are asked. How much farther the consumer is willing to go in the matter of price is very problematical. When the wholesale price of extras (92 score) reaches 66½c and that of higher scoring butter a full cent over that, it stands to reason that the halting point must eventually be reached and that in the near future. While the demand for high grade butter continues strong buyers for under-grades are scarce. That statement is borne out by the margin of price between an extra and a low scoring first. At the present time that margin is 6c. It would seem that retailers would grasp the opportunity to lay in a supply of fair firsts but there seems to be no activity in that direction.

High quality butter is in scant supply and receipts of all grades are at low ebb. That condition will undoubtedly continue throughout the winter. We can not look forward within the next few months at least to a material lessening of the price of butter. Without doubt the prices that have prevailed during the past few months have been very necessary from the standpoint of the dairyman as he has been compelled to pay corresponding prices for feed for his dairy herd.

Since last week Tuesday quotations on extras and higher scoring butter have advanced three cents. The advance started on Wednesday when there was a gain of one cent. That was followed by a half cent advance on Thursday when the price of 65c for extras became established. That price prevailed on Friday and Saturday but on Monday of this week there was another gain of a full cent. Today witnessed a still further advance and the quotation on extras is 66@66½c. Additional quotations at the close today are: Higher scoring than extras (93 score or higher), 67 @67½c; firsts (88 to 91 score), 60½ @65½c; and seconds (83 to 87 score), 56@60c. Unsalted butter is in strong demand and the differential in price has been increased to 2½c over that of corresponding grades of salted butter.

It would be well for the farmer who does not believe it worth his time to take extra good care of his milk or cream to take heed of the margin between the price paid for extras and firsts and seconds. If the butter from his creamery sells as an extra he is indeed fortunate. However, if it sells as a first, due to its being an undergrade, he will find his cream check at the end of the month much less than it might and should be. A very little extra care means several more dollars for him at the end of the month. W. B. LIVERANCE.

To Discuss Milk Production Costs

For the purpose of determining the actual cost of production and distribution of milk and to ascertain from their findings whether the high price charged is justifiable, the National Commission on Milk Standards will meet in the Morrison Hotel in Chicago, Sunday, December 8th. The call was issued by Stephen G. Williams, chairman of the New York Milk Committee, and has been arranged by Dr. Charles E. North, secretary of the commission. Mr. Williams suggested that the commission disclose the effect, if any, that the high prices have made upon the health of the people, more particularly upon infants and young children who depend almost wholly upon milk for subsistence. This will be disclosed by individual reports rendered by the various members of the body concerning conditions in their different localities, such as the changes in the price of milk and milk products during the last four years, changes in the quality of the milk consumed within that period, and changes in the mortality of infants and older persons.

New York Dairymen Meet

The 42nd Annual Convention of the New York State Dairymen's Association will be held this year on December 10, 11, and 12 at the Joseph Slocum College of Agriculture, Syracuse University, Syracuse, N. Y. The large auditorium of this splendid agricultural building has very generously been given to the dairymen for their three days' meeting.

Educational exhibits of dairy products will be shown in the exhibition hall by Syracuse University, Cornell University, The Onondaga County Farm Bureau, and the New York State Department of Agriculture.—T. E. TIQUIN, Secretary.

Some High Producing Oregon Jerseys

F. A. DOERFLER, OREGON

ZAMOLEA Nutwood 196109 at 13 years, 9 months made 482.67 lbs. fat, 8,788.7 lbs. milk; average test, 5.49%. At 15 years, 48 days she started again and in 365 days made 578.57 lbs. fat, 10,168.6 lbs. milk; average test, 5.69%. After two weeks' rest and carrying calf 269 days during last test she started again at 16 years, 2 months and made in the first three months 160 lbs. fat and 3,100 lbs. milk. Zamolea Nutwood's daughter, Nutwood Figgis 328160 started as a senior 2-year-old and made 631.74 lbs. fat, 10,406.2 lbs. milk; average test 6.07, which was fourth highest senior 2-year-old record and now stands fifth highest in the United States for fat. Pogis Irene was a great cow; she made at 14 years 487.29 lbs. fat, 9,177 lbs. milk; at 15 years, 4 months 523 lbs. fat, 8,950.4 lbs. milk and at 17 years, 11 months 590.43 lbs. fat, 9,930 lbs. milk. Zamolea Nutwood is following closely in the footsteps of this great cow, Pogis Irene 2nd. Zamolea holds the world's record for milk and second for fat for cows over 15 years and Pogis Irene 2nd holds first for fat and second for milk.

I was the first to sign up in the Marion County Cow Testing Association and to prove that this work was a success I will say that I purchased this old cow, Zamolea, and her daughter, Nutwood Figgis, from the backwoods and paid $200 for the two. Zamolea's first calf after I bought her was a heifer. She freshened at 21 months. Three months after freshening she milked up to 30 lbs. and tested over 6%, then we lost her from bloat. Her heifer was sold for $300 as a yearling. Zamolea's 2nd calf sold for $300 as a senior yearling. Her third calf was a bull and sold for $250. Her fourth and last calf, dropped May 19, 1918, was a bull and should bring at least $500. Nutwood Figgis produced a bull calf that we sold for $85 before we knew his value. Her second calf, a bull and junior champion at the Oregon State Fair, sold for $250. The calf weighed 96 lbs. when born. In calving, Nutwood received a rupture and proved to be a non-breeder thereafter. We sold her to the butcher for $75. Had we not done official testing this great family would probably never have been heard of. In our second year's test work our 11 cows average 599.42 lbs. fat and 11,354.5 lbs. milk. We know of no other herd in the United States with such a high record, considering the number of cows and entire herd on test, from junior 2-year-old to past 15 years.

I wish to express my opinion regarding what a registered Jersey cow should produce. I claim that a cow milked twice a day should make not much less than 400 lbs. fat in 365 days, or 500 lbs. fat milked three times a day. I claim this where a cow has had a fair chance, but she need not have been crowded at that. The reason I say this is because of the 11 cows in my herd none made under 526 lbs. fat, and this one was a junior 2-year-old. My cows stood in box stalls part of the time and part of the time in stanchions. I had silage about 8 months out of the year and no kale at all. I fed no corn meal or molasses but had fairly good feed most of the time. I also changed milkers several times and changed barns twice.

Some breeders tell me that I have my standard too high and I should not write this to the public, as breeders will get down on me, especially those who have lower records than these, but others claim the same as I. They say that the Jersey breeders should organize and agree not to sell a bull where the dam has a lower record than above mentioned. As many bulls are sold with very low records back of them, usually such bulls or low record cows are sold to new beginners and the result is they fail. This hurts the whole breed, where, on the other hand, if a good animal is sold and their offspring makes good the buyer is very apt to come back for more stock and is probably more willing to pay fancy prices where he knows these breeders sell only high producing stock. Of course, if a cow with a high producing pedigree back of her does not prove profitable the first year I advise not to sell her, and let some one else try her out, but keep her and give her another chance. Then if she proves to be a failure sell her to the butcher. Breeders, don't say, "Doerfler will learn. He will find many low record cows in his herd the same as the rest of us, and his standard is too high." I don't doubt but that I will find some that will fall below the 400 and 500-lb. fat mark, but if I do they will go to the butcher. Another reason why I put my standard at these figures is because a registered Jersey is registered because she should improve production. If she cannot make a good record she is no better than a grade and she should be a grade. Now this is the way I see into the breeding of dairy cattle. If I am in the wrong I would like to hear from some other breeders and have their opinions on this subject.

JERSEY COW, ZAMOLEA NUTWOOD
At 15 years she has a year's record of 10,168.6 lbs. milk containing 578.57 lbs. fat.
OWNED BY F. A. DOERFLER, OREGON

A FEW OF THE JERSEYS AND THE NEW DAIRY BARN OWNED BY F. A. DOERFLER, OREGON
The barn is 48x110 ft. and has a concrete floor. Five dances were given here last summer for the benefit of the Red Cross and netted almost $1,000.

Dairying in New Zealand

HOARD'S DAIRYMAN:—The 1918-19 season will open early next month. The winter has been fairly kindly up to about three weeks ago, when heavy snow fell in the South Island and in the high parts of the North Island. Dairy cattle are not housed in this country all through the year but they "go up" in the winter months. They stay in their paddocks all the year round. Although unusually cold this winter, the weather is not expected to interfere with the milk production of the coming season. On June 30th, there were in the Dominion 410 cheese factories, 185 butter factories, three dried milk factories, and one condensed milk concern. The bulk of the cheese factories are in the provincial district of Taranaki and of the butter factories in the Waikato district, while considerably more cheese than butter is manufactured in the South Island, in Southland, and Otago; in fact, in the winter the South Island usually draws extensively upon the North for butter for the domestic trade. Apart from somewhat intermittent shipments to British Columbia via Vancouver, and a small and spasmodic business with Australia for canning there in bond for the Indian and Eastern trade, New Zealand's only export market is the United Kingdom. At the time of writing, export has ceased but a large quantity of butter is held in store on account of the Imperial government. It is detained for want of sufficient insulated tonnage, although a clearance of all the 1917-18 make is expected to be made by the end of October. There is also a very large quantity of cheese held on imperial account, but not in the freezing stores as the butter is.

Practically all the cheese and butter factories in New Zealand are co-operative concerns owned by the farmers themselves. They pay on the fat basis to their milk suppliers. Here a difficulty has arisen. The returns to suppliers this past season have been approximately 47 cents per pound fat for milk supplied to cheese factories and six cents per pound less, allowing for the skimmilk, to suppliers of butter factories. The discontent of suppliers to butter factories has been accentuated by the knowledge that in respect to the Imperial government's purchase of Canadian cheese at 23 cents for first grade cheese, purchasers of the other milk products were expected at prices which placed all suppliers of milk, for any other purposes, upon an equal footing. If this were done in the case of the 1918-19 make—should the Imperial government be again the purchaser—it would prevent the soreness at present felt by butter producers who see supplies which have hitherto gone to their factories being diverted to cheese factories, if such are within a reasonable radius. This does not apply to the Auckland Northern districts, where home separation of cream the rule. Home separation is e tensively practiced in other parts New Zealand where farms are at considerable distance from the fa tories.

Some cheese factories make a litt butter at the very beginning and the extreme end of the season, but f the rest of the time they concentra on cheese; others make nothing el but cheese, and butter from the whe There are some factories which ha dual butter and cheese plants. T output of butterfat for the whole the Dominion is now estimated to 126,000,000 pounds per annum.

Dried milk is now being made five factories in New Zealand. T process is evaporation of skimmi over heated revolving cylinde butterfat being added. These fa tories with one exception are manag and controlled by farmers but th sell the product to the firm whi erected the works. Milk supplied such factories is paid for on t butterfat basis and two cents p pound over if in the neighborhood a butter factory, and four cen per pound if in the vicinity of cheese factory, whichever is near The two or four cents per pou premium is, of course, to divert mi from a butter or cheese making co cern to the dried milk factories.

There has been considerable e citement and interest created amo dairy farmers in the North Isla by proposals to dry off skimmilk evaporation in a vacuum chamber, consequence of the high current pric reported from London for dri skimmilk powder. Factories are ready building in Waikato for t skimmilk powder industry—farme co-operative concerns, pure a simple. The cost of erection and equi ment of such factories is put at 20,0 pounds to 25,000 pounds each. T machinery and plan is ordered in t United States. In such enterpris butter will be regarded only as a ki of by-product. It cannot be said th those connected with the financing the dairying industry, apart fr the most ardent advocates of t scheme, are very sympathetic wi it. The government, usually so prom to assist farmers, does not turn very kindly eye upon the dried m proposition. The reason of this a parent lack of interest in the dri milk idea for New Zealand is that is only likely to be as highly a luc tive enterprise, as its sponsors clare, while the current high pric for the manufactured article can upheld. Further, that the market w practically be limited to Great Brita in any case, inasmuch as all Ame can requirements can and will fully met by dried milk manufact

s in the United States, who in any se are able to turn out a much tter article than New Zealand can ok to do for some years to come. ood cheese and good butter New aland has proved can be made in is country; therefore, many who are terested in the development of the irying industry hold that farmers ould stick to what they know best d improve their butter and cheese.
New Zealand. GEORGE OSBORNE.

Help Avoid Burlap Shortage

Continued and increasing war demand on the jute industry of India burlap makes necessary the utmost conservation of this product ich we have been accustomed to e freely, even wastefully. India is e great jute center of the world. ere the jute is grown, made into fer, and manufactured into jute th which is commercially known as rlap or gunny-sacking.

Imports of burlap cloth by the ited States normally average about 0,000,000 yards annually. After ching this country most of the burl cloth is sewed into bags, most of ich are used as containers for food al feed. Investigations by the Food dministration show that somewhat re than three-fourths of all burlap ported is used by farmers in shipg agricultural products or in buyi necessary supplies.

Familiar products shipped principly in burlap include cereal grains, l feeds, mixed feeds, seeds, fertiliz potatoes, onions, binder twine, and sery stock. In peace times burlap s are worth about 6 or 7 cents a-e, and at this value dealers found mpractical to advertise for, gather, re-use second-hand bags. But the sent price, which is about four es these figures, and the decreased orts owing to such enormous prices rant the most careful conservation re-use of bags.

The U. S. Food Administration is hout authority to control either supply or price of burlap from ia at the moment, but the importe of this product as a food and l container makes a full understanding of the situation by farmers rable. Here are the Food Administration's requests:

urlap is valuable. Save the present ply, reserving enough on farms profitable future needs.

here is a good demand for second-d bags at fair prices. Put surplus s back into the channels of trade.

ven fertilizer bags can be saved ss acid fertilizers are allowed to ain in them too long. Empty the s at once, wash, and dry them. ar bags, after emptying, should be washed and dried.

ou need not mend torn bags that to be sold. Bag manufacturers special facilities for doing this and they prefer to do it.

llow no burlap or bags to mildew o be damaged by storing in a p place. Keep them clean and dry.

y waste of burlap adds to the nal demand, which in turn causes economic pressure for shipping India. Saving burlap helps to shipping to supply the American d forces abroad.

addition to the international and ary sides of the question which the most important, a personal deration may also be mentioned. burlap imported by the United s now costs about $150,000,000 ally, of which at least $100,000,is ultimately paid by American ers. The Food Administration bes that this figure can be materialduced if conservation is actively iced and the re-use of second-bags encouraged.

"DELCO-LIGHT is a Time and Labor Saver"

"We have had our Delco-Light plant for more than two years now and the work that it is doing out here saves several hours of time each week.

"The time and labor saved multiplies man-power on the farm.

"So you see Delco-Light is a good investment.

"By just pressing a button we can start an electric motor that runs the washing machine for my wife, milks the cows, operates the cream separator or tumbles the churn.

"Delco-Light gives us running water throughout the house and barns. It furnishes good, safe, clean electric light everywhere. We can do our chore work after dark as well as in broad daylight. And it does not take as long as when we had to lug lanterns about.

"The old smelly lamps and lanterns have been stored away. They are nothing but relics now, like the cradle my great-grandfather used, to harvest grain.

"Electric light eliminates fire risk. I do not fear fire any more.

"And the beauty of it is that we have all of these things at low cost. The plant runs on KEROSENE. The same kerosene that we burned in the lamps and lanterns, furnishes both electric power and light.

"Delco-Light pays for itself. There is no question about it.

"Before I had Delco-Light I did not know much about city conveniences. I believe that if I had to give up Delco-Light now I would move to town. My family would insist on it. Delco-Light helps every one of us in our work and keeps the children contented."

The above sums up statements made in over 5000 testimonial letters just received from users—More than 60,000 such users endorse Delco-Light.

THE DOMESTIC ENGINEERING COMPANY
Makers of DELCO-LIGHT *Products*
DAYTON, OHIO

A complete Electric Light and Power Plant for Farms and Suburban Homes—Self-Cranking—Air Cooled—Ball Bearings — No Belts — Thick Plate Long Lived Battery—RUNS ON KEROSENE

FREE This Book

"Million Dollar Milker" Book
Buy no milker without first getting this new complete book on milking machines. Full valuable authentic facts about the proved success and reliability of mechanical milking.

$1 Per Cow Per Mo. After Trial
Try this milker FREE. If satisfied, pay only a small part down, if you like, balance $1 per cow per month and a year to pay.

Saves ⅔ Labor
Learn why we call the Pine Tree Milker "The Million Dollar Milker"—how $1,000,000 backed the inventor—why we can give the ONLY 3-year guarantee. Saves two-thirds work and expense—increases profits.

More Milk
100% efficient in simplicity, reliability, durability and gentle, calf-like manner of milking. Milks like the calf sucks. Increases milk flow; lengthens lactation period. Cows like it.

Try One FREE PROVE by FREE TRIAL on your farm.

A Dwarf in Size A Giant in Power

Only 40 to 60 lbs. per H. P. yet Plenty of Surplus Power

Compared to ordinary farm engines, Cushman Engines are very light for the power they develop. They weigh only about one-fourth as much as other farm engines.

However, when compared with high grade engines used for other purposes, Cushman Engines are not regarded as unusually light in weight. For instance, they weigh several times as much, per horsepower, as automobile engines.

Cushman Engines are high grade engines built for farm work—made as heavy as they need to be, but no heavier. They are balanced so carefully and governed so accurately that they do not need such heavy construction.

Light weight power is much easier to handle for all ordinary jobs like grinding, etc.

Even with their lighter weight, Cushman Engines run much more steadily and quietly than ordinary farm engines weighing several times as much. They are also the most durable farm engines in the world, on account of improved design and better material and construction.

CUSHMAN

Light Weight (273) All-Purpose Farm Motors

Easy to Move from Job to Job

They do many jobs in many places instead of one job in one place.

Weigh Only One-Fourth as Much

as ordinary farm engines. Light weight and higher speed mean **more jobs, easier handling, less waste of material and fuel and steadier running.** Cushman Engines are the standard light weight engines of the world.

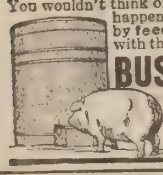
4 H. P. weighs only 190 lbs., being only 48 lbs. per horsepower. This is the most useful farm engine ever built. Besides doing all ordinary jobs, it may be attached to any grain binder, saving a team, and in a wet harvest saving the crop. Also it may be used on corn binders and potato diggers. Very easy to move around from job to job.

8 H. P. weighs only 320 lbs., being only 40 lbs. per horsepower. For all medium jobs. Also may be attached to hay presses, corn pickers, saw rigs, etc. 8 horsepower and larger Cushman Engines are all double cylinder.

15 H. P. weighs only 780 lbs., being only 52 lbs. per horsepower. For heavier farm jobs, such as 6-hole corn shellers, ensilage cutters, large feed grinders, small threshers, etc.

20 H. P. weighs only 1200 lbs., being only 60 lbs. per horsepower. For heavy duty jobs, such as shredders, shellers, grain separators, heavy sawing, etc.

Besides doing all ordinary work, Cushman Engines may be easily attached to machines in field. Picture shows 8 H. P. on Hay Baler.



Cushman Engines stand up under wear and tear and do not wear unevenly and lose compression. Every running part enclosed free from dust and dirt and properly lubricated. Equipped with Throttling Governor, Carburetor, Friction Clutch Pulley and Water Circulating Pump. Ask for Book on Light Weight Engines.

Cushman Motor Works 817 N. 21st Street Lincoln, Nebraska

WARM WATER With 15c Oil In Place of $1.50 Grain

You wouldn't think of burning $1.50 grain under a water tank! Yet that's what happens when stock drink ice water! Their body-heat—produced by feed—is absorbed in warming ice water instead of making milk, muscle fat. Warm the water with this oil-burning heater; your stock will drink more—require less feed—save bushels of grain.

BUSBY OIL-BURNING TANK HEATERS and NON-FREEZING HOG WATERERS

Tank heater costs one-half cent per hour for kerosene. No smoke, no sparks, no danger. Fill tank once in 36 hours. Keeps water at animal heat. Can't freeze even at 30 below zero.

Free Folder and Special Offer. Busby Hog Waterer costs 2c a day for kerosene. Holds 70 gallons of water. Never freezes. Write for special discount offer to owner-agents on tank heater and hog waterer.

C. W. BUSBY & CO., 312 North Seventh Avenue, WASHINGTON, IOWA

A Healthy Udder

means comfort for the cow and a generous, easy milk flow. BAG BALM, the great healing ointment, will keep the udder free from sores, chaps, cuts, bruises, cracks, bunches and inflammation.

BAG BALM

IS ESPECIALLY EFFECTIVE AT THE CALVING PERIOD WHEN CAKED BAG FREQUENTLY OCCURS.

Its penetrating and softening effect is immediate. Every dairy should keep Bag Balm on hand.

Sold by druggists and feed dealers, in big 60c packages. Write for free booklet, "Dairy Wrinkles."

Teat Operations

The teat operations I am going to describe are a few simple operations that I have used for a long time in my practice with satisfactory results. My clients are satisfied with them, as indicated by their repeated calls for these operations. I will first take obstructions of the end of the teat, caused by injuries, frost bite, infection, etc., most commonly found in cows kept in the old fashioned wooden stanchion which favors injuries by treads, etc., from the adjacent cows much more than does the modern stanchion with pipe partitions.

The histories of these cases are much alike. The owner or herdsman informs you that they were all right at the last milking, but milked with much difficulty or not at all from the affected teat the next milking. Upon examination we find a hard swollen condition of the teat end with or without a wound or wounds. The quarter may be relieved of its milk by using a teat tube but these cases will terminate unfavorably if the use of the teat tube is persisted in. I have never yet found anyone able to lay down a rule whereby the layman could use a teat tube twice daily for any length of time, without disastrous results to the quarter. The ordinary man considers a teat or tube clean if he is unable to see any dirt on them. I formerly used hard rubber teat bougies, or metal teat plugs, to dilate the affected duct, with unfavorable results; in fact, I have tried every apparently sane way of handling this condition, with very poor success until I began doing the operation I am about to describe.

It is absolutely essential in doing teat and udder operations to have the animal well restrained. First, the teat is well cleaned, especially at the orifice; it is then dipped in etherized iodine. I carefully introduce a sterile teat bistoury, with the blade guarded into the orifice and up past the obstruction which is the inflamed swollen circular muscle that forms the valve. I then engage the cutting point of the blade to the superior or upper side of the muscle and put on enough pressure to divide the muscle, being careful not to punch through the skin or cut the mucous membrane at the orifice of the teat. Repeat the procedure until the muscle has been divided three or four times at equal distances. The milk usually runs out in a stream until the quarter is one-fourth relieved when it is then necessary to empty the gland by milking. The after treatment consists of dipping the teat before and after milking in a 1-1000 solution of mercuric chloride and the milker's hands should be clean and dipped in the same solution before milking or handling the teat.

The next operation is for the fibrous growths that obstruct the duct of the teat, anywhere from the upper part of the lower third to the gland usually found at the upper part of the middle third. If a teat bistoury or curette is used on these cases the immediate results are good but in from three to ten days the trouble recurs. I find the best way to handle obstructions of this kind is to prepare the teat by washing with soap and water, rinsing with 1-1000 solution of mercuric chloride, dip in etherized iodine, inject a few drops of a 5% solution of cocaine into the field of incision; roll a rubber band up to the base of the teat to prevent bleeding, tense the teat by stretching, then with a sterile, sharp scalpel make an incision down on to the fibrous growth, dilate the wound and dissect the growth out with a blunt pointed pair of scissors, apply etherized iodine to the wound. Leave the rubber band on two hours, then remove by cutting with scissors so as to not molest the wound.

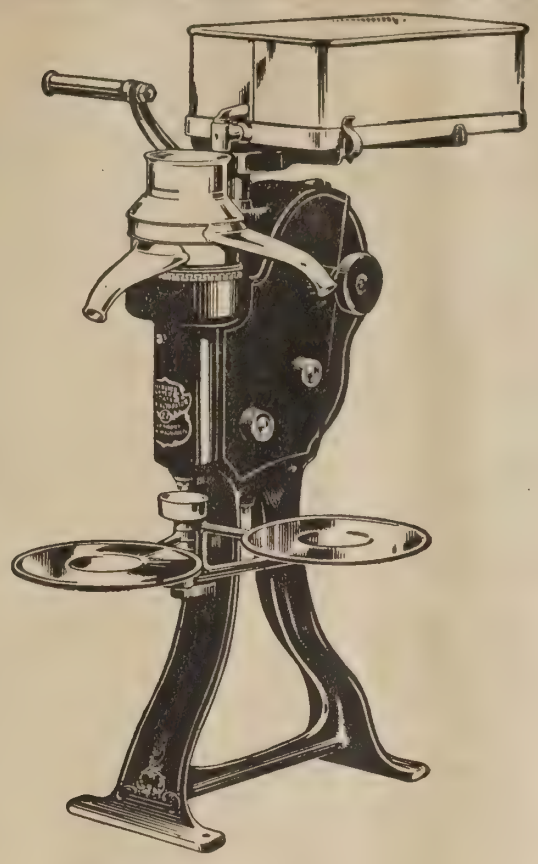
After Treatment

Apply etherized iodine and antiseptic powder twice daily for three days, then once daily. The milk will leak out sufficient to relieve the gland the first few days, then it will be necessary to strip it out by hand with precautions against infecting the wound. If the wound does not become seriously infected this operation gives satisfactory results and will save a good many teat quarters that would be lost to other treatment.

Complete stenosis of the milk duct may occasionally be cured by slitting it completely from the base to and through the muscular valve at the apex of the teat, being careful not to cut through the mucous membrane at the orifice. Four incisions, equal distance apart through its entire length are necessary.

Atresia of first calf heifers may be relieved in the same way after perforating the entire length of the teat with a large sterile probe. This condition is usually caused by being sucked by other calves while a calf.

In cases of severe wounds or other injuries to the teat ends, when the parts are beyond repair, complete ablation of the affected part is indicated and it is surprising how well some of these cases will terminate providing the cow is on a good flow of milk when the operation is performed.



Blocking of the teat duct, with casein or blood clots, is best relieved by manipulation with the fingers. Every country practitioner should practice such manipulation until he becomes expert at it and by so doing save a good many teats and quarters.

Fistula of the teat is best operated when the cow is dry, preferably a month or more preceding parturition. Some object to casting a cow heavy with calf, but I have had no bad results from doing so.

The field of operation must be thoroughly cleansed with soap and water, thoroughly soaked in a 1-500 solution of mercuric chloride, and the whole teat painted with tincture of iodine. The instruments, scalpel, tissue forceps, artery forceps, teat tube, scissors, needles, suturing material, sterilized by thorough boiling. Inject a few drops of 5% solution of cocaine into the field of incision and around the fistulous tract; introduce a long sterile, self-retaining teat tube into the teat, leaving it there for a guide, apply a clean rubber band to the base of the teat to prevent bleeding, grasp the fistulous tract with a pair of forceps and completely isolate it by an elliptical incision on each side of and down to the duct, make a clean cut section, removing all the skin lead down to the duct, then suture, using the mattress stitch, do all the operating and handling of the teat with sterile instruments, apply ether and iodine and collodion. If the operation has been done surgically clean the wound will heal by first intention and the teat will be O. K. when the cow freshens.

Removing supernumerary teats to improve the appearance of the udder is best done in heifers or when the cow is dry. Use the same restraint, remove the teat or teats close to the udder with a pair of sterile, sharp scissors, and cauterize the duct or wound with the small point of a thermo cautery at cherry red heat. No after treatment is necessary.

Address by DR. THOS. H. FERGUSON, Wisconsin, at 54th annual meeting of the A. V. M. A. Clinic, Kansas City, Missouri.

Winning 100% Efficiency While 80% on War Work

Soon after the great war started our Company made a decision about as follows: "Until this thing ends, and ends right, our place is in the service. Nothing else matters much until it's all over 'Over There.' "

So we went to it—shrapnel and high explosive shells for our Allies and, later, for the U. S. A. Eighty per cent of our manufacturing energies were concentrated on day and night war work.

But during all this time every atom of the inventive genius that had made the "United States" separator highly efficient was working to make it infinitely better.

We have won our goal. Important refinements and improvements were accomplished. In the past eighteen months the Government has issued to us no less than *seven exclusive patents.*

There can be but one answer — the United States Disc Separator will sell and *stay sold* wherever dairy cows are raised for profit. Such sweeping points of merit cannot fail of recognition.

The "United States" has changed—for the better. Our peace-time job will be to keep this machine so efficient that when a better separator is made, it will be a

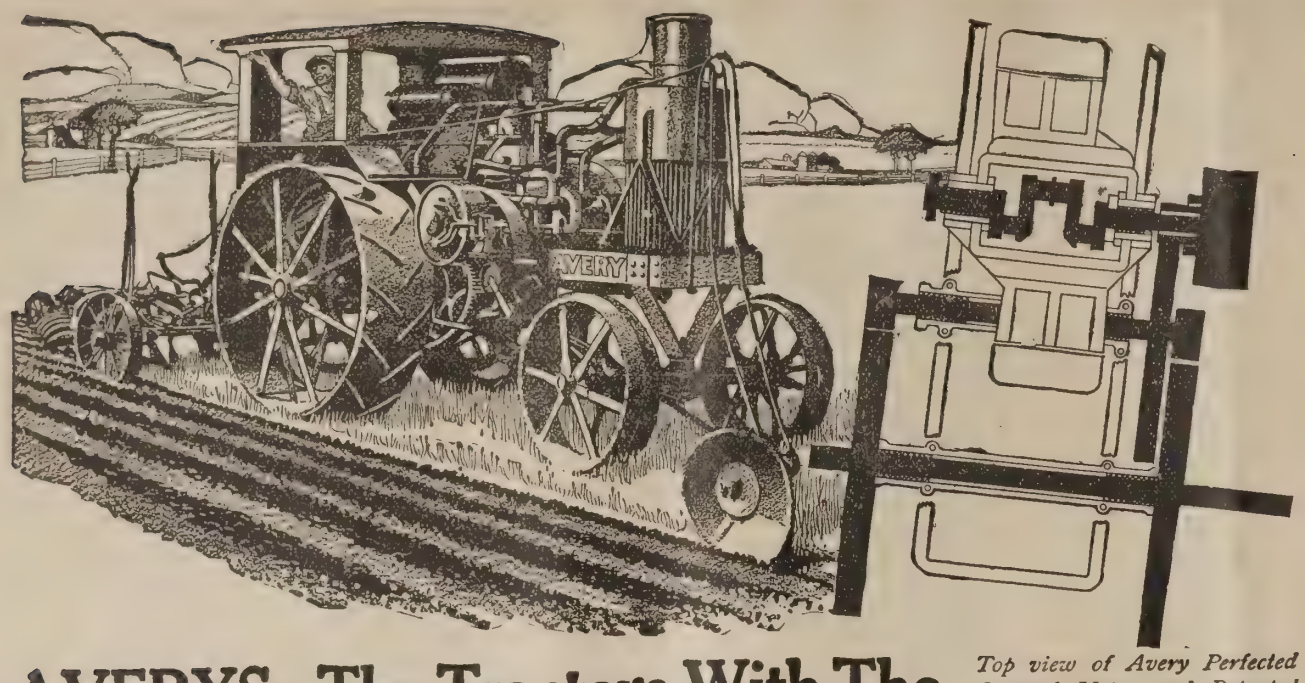
UNITED STATES
DISC SEPARATOR

Things You'll Notice Every Day You Own a "United States"

Get these three points fixed *Now;* others later

FIRST—One-piece frame construction. Means long life—it is made to grow old gracefully.

SECOND—Interchangeable discs that even a child can clean and reassemble with ease.



THIRD—Low Crank Speed—larger sizes only 42 revolutions per minute means 20 to 30 per cent less energy to the operator.

Find the "United States" dealer; let him demonstrate this wonderful machine point by point. Meantime, write for full descriptive literature.

Vermont Farm Machine Company

AVERYS—The Tractors With The Perfected Opposed Motor and Patented Sliding Frame Transmission

Top view of Avery Perfected Opposed Motor and Patented Sliding Frame Transmission. Note direct drive to belt wheel and drawbar—only 3 shafts—only 8 gears—all straight spur gears.

THE **Perfected Opposed Motor** used in Avery Tractors has advantages for tractor work which no other tractor motor has.

An opposed motor distributes the weight correctly between the wheels, makes possible a narrow tractor—has a short crankshaft with only two bearings—is stronger in construction and runs at a low speed.

The **Avery Perfected Opposed Motor** has all these advantages—and then many more. We built it with the heaviest crankshaft in any motor, a round radiator with thermo-siphon cooling system, and valves in the head. Then we invented the wonderful Avery renewable inner cylinder walls, adjustable crankshaft boxes and gasifiers for burning kerosene and distillate. **No other motor used in any tractor has even half of these features.** The power of this motor is delivered to the belt wheel and drawbar by the simplest system built—the **Avery Patented Sliding Frame Transmission.**

This is the only transmission that makes possible a direct drive in either high, low, reverse or in the belt. It has only one clutch—only three shafts—only eight gears—all straight spur gears. The belt pulley is mounted on the crankshaft, and no crankshaft bearing on the frame or bevel gears are used. Without a question the **Avery Patented Sliding Frame Transmission** is the simplest and most efficient belt and drawbar transmission system built.

Write For Catalog or See An Avery Dealer

You will find this same type of Motor and Transmission in all five sizes of Avery Tractors, from 8-16 to 40-80 h. p. The Avery line is a complete line of power farming machines, including also a special 5-10 h.p. Avery Tractor, the Avery Motor Cultivator and Avery "Grain-Saver" Threshers and Tractor Plows. They are ***successfully used by farmers in all 48 States and 61 Foreign Countries.*** Ask for catalog or see an Avery Dealer.

Let Us Teach You How To Run A Tractor—FREE

Avery Tractor Service Schools will be conducted at all our Branch Houses, Distributors' and at many of our Dealers'. If you cannot attend, you can get the same instruction free in our Correspondence Course. It covers these subjects:

1. The Principles of a Tractor Motor. 2. Carburetor Adjusting. 3. Magneto Care and Repair. 4. Adjustment and Lubrication of Bearings. 5. Valve Grinding. 6. Belt and Drawbar Transmission Systems. 7. Operation of a Tractor.

Dates of Service Schools at Avery Branch Houses:

Dallas, Texas	Dec. 4-6
Kansas City, Mo.	Dec. 9-11
Wichita, Kans.	Dec. 12-14
Omaha, Nebr.	Dec. 16-18
Lincoln, Nebr.	Dec. 19-21
Madison, Wis.	Jan. 9-11
Des Moines, Iowa	Jan. 13-15
Sioux Falls, S. D.	Jan. 16-18
Aberdeen, S. D.	Jan. 20-22
Minneapolis, Minn.	Jan. 23-25
Fargo, N. D.	Jan. 27-29
Grand Forks, N. D.	Jan. 30-Feb. 1
Billings, Mont.	Feb. 3-5

Indianapolis, Ind.	Feb. 17-19
Columbus, Ohio	Feb. 20-22

Special Avery Exclusive and Protected Features

Take particular note of these exclusive and protected Avery Features:

1. Renewable Inner Cylinder Walls enable us to use a harder material which wears longer and, if it ever does wear, the walls can be replaced and the Motor made as efficient as in the beginning and with less expense.

2. Adjustable Crankshaft Boxes, which enable you to take up any wear in the main bearings instantly without tearing the Motor down.

3. Duplex Gasifiers, which turn kerosene, distillate or other low-grade fuel into gas and burn it all.

4. Double Carburetor, by which you can start on gasoline and instantly switch to kerosene or distillate without having to make a single adjustment.

5. Crankshaft one-half or more in diameter than the cylinder and so strong it is almost unbreakable.

6. Thermo-Siphon Cooling System, which does away with the pump, fan, belts, gears and chains and saves the power required to drive them.

7. Round Radiator, which catches the wind from any direction.

8. Internal Gear Pump Oiling System that protects every working part of the motor.

9. Sliding Frame Transmission, which transmits the power to the belt wheel and the drawbar with the least loss, and is the simplest and most durable transmission system built.

10. Univeral Self-Cleaning, Non-Slipping Lugs that fit all conditions of field or road work.

Alfalfa Turns Yellow

HOARD'S DAIRYMAN:—While the
are numberless causes that may cau
alfalfa to wilt and yellow, the moi
ture factor should never be lost sig
of nor the fact that this will opera
quite differently according to the a
of the alfalfa and the length of i
root, the porosity of the subsoils,
the presence of hardpans or ev
hard textured soils. A good deal d
pends on the time of cutting and
alfalfa fails to bud it should be c
when ready; on the other hand, r
peated early cutting before it
ready to shoot will encourage oth
growth which will eventually ov
come the alfalfa. Alfalfa will live
very long time without surface mo
ture and it is largely due to this fa
that on the western plains alfal
easily combats and defeats all wee
and grasses; while in the cool
moister hill regions it is overcome
dandelions, pepper grass, blue gra
and other competitors. In three yea
with an annual rainfall of twen
inches, alfalfa will exhaust all the f
water and its survival depends on
access to a permanent water table
one frequently refilled.

With sufficient heat, the limit of t
alfalfa crop like corn, only more
is the moisture available, which in
country of ordinary rainfall is eas
exhausted; in an irrigated coun
supplied up to the need of the cr
at the rate of from two feet in de
to as many as five and six feet
acre. On a small piece of wash s
we have almost every soil conditi
from hardpan to a very free, op
decomposed coarse granite. For
purposes of observation we allow
alfalfa to go dry or water it. Bef
the alfalfa had penetrated the ha
pan on the silt soil it yielded v
little, its root area being limited
15 to 18 inches in depth and a sp
of about a foot square per plant.
the gravel soil it is even thinner
the roots have always been m
longer, losing their tap form a
depth of 2 to 3 feet and splitting
into very fine hairs—quite unlike
dinary alfalfa roots. The bigger
first crop the dryer the soil is left
the next crop if, as often happe
spring rains are sufficient for a
first crop and later rains fall. Th
is no second cutting without irriga
and if this continues long enough
crowns become so dry that they
be easily broken off. Such buds as
start wither and die except on a
plants with spreading root and cr
that usually manage to per
through any drouth. Whether thi
due to the plants or pockets of cla
the subsoil cannot be said decide
perhaps to both causes.

Nearly forty years' experience v
alfalfa varying from hundreds
acres down to small patches un
closer observation lead me to say
the worst conditions for alfalfa
great moisture with cool weat
early in the season with subsequ
dry weather. Such conditions
courage the growth of trash and
to give alfalfa the advantage of
deep roots over surface feeders;
fact, the desirable condition is the
verse of that with the timothy
clover crops. With plenty of heat
get a big first crop; without it an
cool weather the other plants th
better than the alfalfa. Rooted
deep, porous soil, alfalfa shows m
of the same qualities as corn and
gins to thrive best when other c
and grass fail but this it canno
until it has penetrated deeply, an
countries with much heaving its
growth is subject to much inter
tion and there is no question as t
superiority of Grimm and Baltic
rieties.

With refractory subsoils one alf
failure or more should never be
lowed to discourage us. The

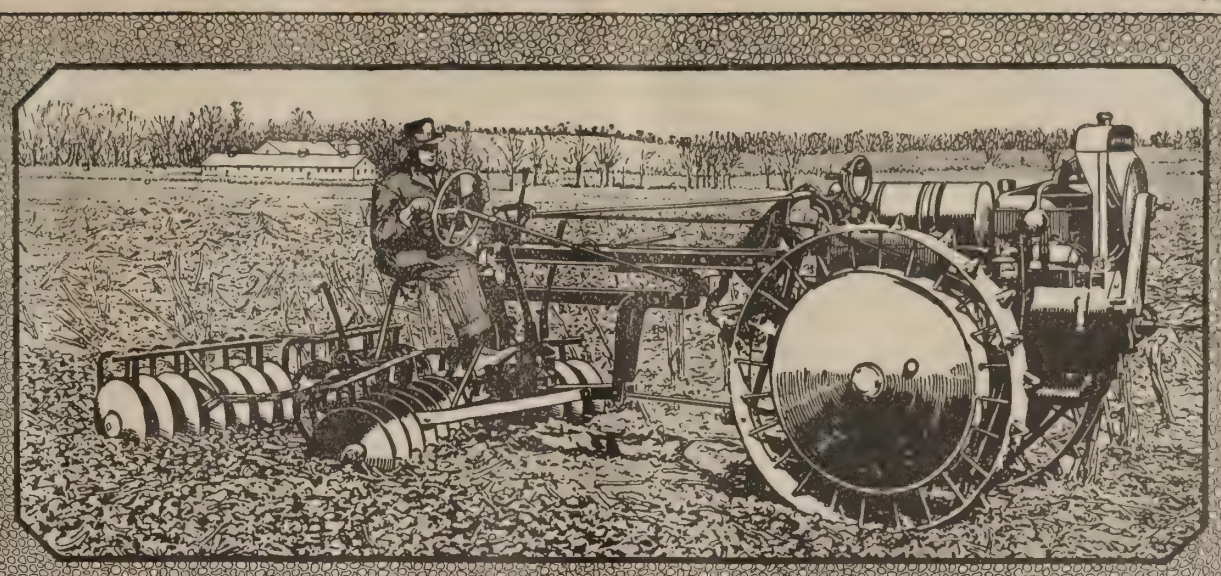
l be cleaned by fallow or potas nd at once reseeded. The plants eap the benefit of the attacks de- d by the first plants upon the l.

n is a grosser feeder and is deeper l than potatoes and if it can be as clean will often serve better, e potato root is unable to follow pe made by the alfalfa root the ear, though it will do so the sec- corn roots will run down along- The new broken alfalfa field is noculated and full of humus some of the lime already applied needful and the second immedi- repeated attack is far more like- be successful than the first. Un- ound conditions are more often minant ones than mere surface tions. It is a capital thing to pick and shovel and put in a day l out what plant roots are to be against instead of walking lei- around on top where a few s have been civilized to plant Alfalfa is the greatest subsoil- l the cheapest tillage agent if it given a chance to get going in sive generations where the con- s are not sufficiently good for tire success of the pioneer crop. orado. L. OGILVY.

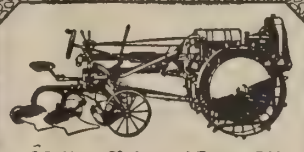
Dairy Industry in Mexico

ARD'S DAIRYMAN:—That grazing ther conditions in certain parts exico are ideal for the develop- of the dairy industry is the re- which has just been made to the tment of Agriculture of the an government by men who had more or less experience in ine. Plans are on foot for im- g several thousand head of cattle from the United States e purpose of stocking farms are situated adjacent to the pal cities of the country. The s of the proposition have not worked out as yet, one of the still under consideration being er the dairy herds shall be t by the different state govern- and sold on reasonable terms farmers or whether the federal mment shall bear this cost.

m a natural grazing standpoint are sections of Mexico which id to be the equal of the famous districts of New Zealand. This rticularly true as to the states ichoacan, Jolisco, and parts of ulipas, Vera Cruz, and Puebla. ically all of Southeastern Mexi- well fitted for dairying, the re- says.



the pre-revolutionary days con- able advancement had been made e operation of modern dairies in o. The industry was in the of Americans almost exclusive- n the vicinity of Monterey, San Potosi, Chihuahua, Tampico, of Mexico and other of the larg- ies American dairies were con- d. Most of these dairy herds be- scattered as a result of the long d of revolutionary activities. cas. W. D. HORNADAY.



Lame Cow

ve a young cow which I believe is afflict- n rheumatism, but would like your opin- d advice. She seems to be affected most- the right knee. Will be all right for a eriod, then will get so lame over night n hardly walk, accompanied by loss of e. The knee at times becomes enlarged e swelling is very soft and does not feel h.

ana, Iowa. J. A. P.

e cow may be bruising her knee, would be well to stable her in a y, well bedded box stall. At times tack, poultice the knee with anti- istine, or other plastic dressing ed hot, covered with cotton bat- and renewed each time it tends come dry. Meanwhile, rub in a iodex if the knee remains en. We assume that the cow has tested with tuberculin. If not, should be done.

Moline-Universal Power Lift Gang—Extra strong construction, simple power lift operated by foot lever, equipped with quick attachable shares and combined rolling coulters and jointers. In average soil conditions this outfit will plow 9 acres a day.

Moline-Universal Disc Harrow—Strongly constructed with 18-inch blades. Each gang has 3 large dust-proof bearings equipped with wood bushings. Easily and quickly adjusted. Built in 6 and 7-ft. sizes double cut, or 8, 9 and 10-ft. single cut.

Moline Grain Drill—Operator sits behind the drill where he can see work being done. Furnished in a great variety of sizes either as plain or fertilizer drill. Deposits seed with unvarying accuracy. Equipped with either single or double disc furrow openers.

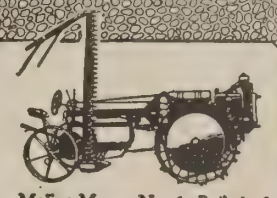
Moline-Universal Tow-Row Cultivator—With this outfit 10 to 20 acres a day can be cultivated. Entire outfit easily handled. Tractor speed easily regulated from ½ to 3½ M. P. H. Cultivator is extra strong and has pendulum foot gang shift.

THE TRACTOR
for ALL Your Work
AND ALL THE IMPLEMENTS
to Do It With

Mr Nile Kinnick of Adel, Iowa, operates a 400-acre farm and all the work is done by two men, two Moline-Universal Tractors and one team of mules. This is what he says about the Moline-Universal:

"I was agreeably surprised with the ease with which we could cultivate corn, and for harvesting it far surpasses horses or mules. It appeals to me as an ideal tractor. It will actually replace horses, something that most farmers must consider when they plan to buy a tractor. The ease with which it is handled and the advantage of operating the outfit from the seat of the implement are facts that cannot be appreciated until one has tried it."

This expresses in a nutshell the advantages of the Moline-Universal. It does *all farm work* including cultivating; *one man* operates both tractor and implement from the seat of the implement; it has *ample power* for heavy field and belt work, yet can be operated economically on light work.

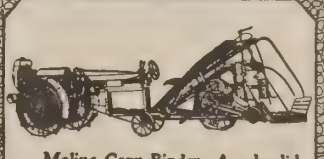


Another big feature that makes the Moline-Universal superior to all other tractors is the complete Moline Line of Implements to be operated in connection with it. This does not mean it is necessary to purchase all of these implements with the tractor, as many horse drawn implements can be used successfully. But it does mean that a Moline-Universal owner can operate his tractor to full capacity at all times and make the best use of the operator's time by using Moline tractor implements. They do better work with the Moline-Universal, are of larger capacity, stronger construction, are designed to run at higher speeds than horse drawn implements, and will pay for themselves in a short time.

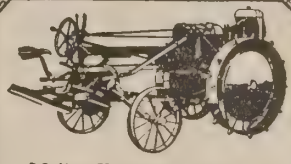
For full information Address Dept. 18,

Moline Plow Co., Moline, Ill.

Manufacturers of Quality Farm Implements Since 1865

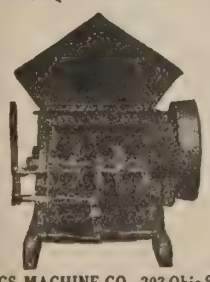


MOLINE
UNIVERSAL TRACTOR



Moline Mower No. 4—Built in 6, 7, 8 and 10-ft. cuts. The largest capacity mower in the world. Proportionately larger and stronger than ordinary mower. Equipped with spring draft rod. One man operates both tractor and mower.

Moline Grain Binder No. 11—Cuts a 10-ft. swath. Extra strongly constructed throughout. Cuts 35 acres a day. Equipped with power bundle carrier. One man handles the tractor and binder easier than he could a binder and horses.



Moline Corn Binder—A splendid outfit for cutting corn easily and quickly. Power bundle carrier deposits bundles away from the path of the tractor. Strong and durable. One man operates the entire outfit easier than with horses.

Moline-Universal Tractor Attachor—A great variety of equipment can be attached to rear crossbars, so that majority of operations in orchard and vineyard work and cane growing can be performed with this one outfit.

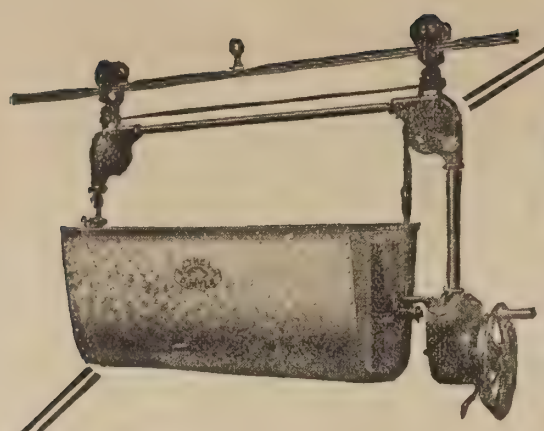
COW BOY SURE HEATER for STOCK TANKS

HELP FEED THE WORLD

Don't Waste Grain; but Save it and Produce more **Meat**, **Butter** and **Milk** by warming the drinking water for your stock with coal, wood or cobs with a

COW BOY TANK HEATER



Quickest to heat; strongest draft; adjustable grates; ashes removed without disturbing fire; keeps fire 24 hours.

Absolutely Safe; pays for itself in 2 months with 4 cows; **Self-Sinking;** can be used in Wood, Steel or Concrete Tanks of any size. Most reliable, practical, efficient and durable Tank Heater manufactured.

"Purchased 3 of your Tank Heaters last Winter, worked very satisfactorily and are well worth their cost. Every Stockman should use one." W. H. Pew, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

Get a Heater early. Write now for illustrated circulars and dealer's name.

THE WILLS MFG. CO., 32 Seventh St., MENDOTA, ILL.

Porter Litter Carriers

Priceless time, labor that runs into dollars—save them both with a Porter Litter Carrier—thousands of farmers all over the United States are doing it.

They're saving time and labor on what most of them think is the "toughest" job on the farm. The farmer knows that a little money expended on a labor-saving device is money well invested—that is, if the device is "right."

And most farmers know that a Porter product is right—that the Porter slogan, "Simplicity, Sanitation and Durability," is lived up to in everything turned out with the Porter stamp on it.

Save Time and Labor

Geared Hoist Litter Carrier—Most popular of the Porter models, shown in illustration above. Operated with plain spur gear and wire rope drums. Simple in design and operation, installation practical, reliable. Entire mechanism boxed, making it absolutely dirt and weather-proof. Runs on swiveled trucks adapted for Columbian steel track.

Chain Hoist Litter Carrier—Preferred in some cases. Like the geared hoist carrier, the tub can be tipped either way. Free from complicated parts. Tripped by light line as is geared hoist carrier.

We manufacture a complete line of stalls, stanchions, pens, carriers, etc.—the practical kind that show returns on the investment.

Your dealer can give you complete specifications. Write for our catalog.

Holstein Breeders' Sale Company Consignment Sale

The Holstein Breeders' Sale Co., an organization of Holstein breeders in central Wisconsin, has a splendid new sale pavilion at Fond du Lac, Wis. It is an excellent pavilion, one of the best, if not the best, in the country. It was completed this fall just in time for the November 14 and 15 sale and very naturally buyers who attended that sale went expecting a sale in keeping with the building in which it was to be held.

They were not at all disappointed. One hundred sixty-eight head were offered, practically all of them in sale shape, and the fact that they sold for $41,000, an average of $244, shows plainly that they were appreciated. The 29 bulls sold for an average price of $217; the 139 females for a $249 average. There was a particularly keen demand for heifers bred to freshen this winter and everything, individually good, that was offered in that line was snapped up at very satisfactory prices.

Buyers from four states, Iowa, Minnesota, Colorado, and Wisconsin, contributed to the success of the sale. F. D. Baker, Iowa, was the heaviest buyer, taking 18 animals for an average price of $259.

The sale included the dispersion of the Reid & Dawson herd, but Andrew Frank was the heaviest consignor with 44 animals, most of them heifers and young cows. They sold for $9,630, averaging $218. Another of the very good consignments, although a much smaller one, was from the herd of Jno. Puls, Wisconsin. His included 5 granddaughters, 2 and 3 years old, of Sarcastic Lad. This little group proved especially popular and brought an average of $525.

The highest priced animal of the sale was Meadowholm Ona Button Hartog, junior sire in the herd of Reid & Dawson. He is but a 2-year-old, sired by a 30-lb. grandson of Pontiac Korndyke and from a granddaughter of Aaggie Cornucopia Pauline Count that has 30 lbs. butter in 7 days and 1,345.55 lbs. in 365 days. He was purchased by Chas. Braatz & Sons, Wisconsin, for $1,550.

Haeger, Mack, and Pohlman did the selling, with S. T. Wood in the box. S. H. Bird managed the sale.

Following is a list of all animals selling for $200 or more, prices, and buyers:

Otto Hinsel, Wisconsin

...Heid's and Rush Chapman's Guernsey Sales

...re were some very good Guern...ffered at W. J. Heid's and Rush ...an's dispersion sales held ...9 and 20, respectively, at Fort ...on, Wis. Both were strictly ...rs' sales, practically every ...l sold having been bred by their ...tive owners, and as might have ...xpected the stock sold very well. ...'s 36 head sold for $8900, an ...ge of $247. The 31 females in ...rd, including calves, brought an average of $273, with the highest ten bringing a total $3940.

Chapman's herd of 27 head sold lower, they brought a total of $5945, but that was to have been expected because he had done no official testing. The 22 females in his herd sold for an average of 246, with the high ten selling for $2740.

Nearly half of the Heid herd went to breeders from Colorado, Virginia, Georgia, and Illinois, but things were quite reversed at the second sale, most of the animals being purchased by local buyers.

Both of these were good herds but in each case better prices could have been obtained had more A. R. work been done. That which Heid did, made a noticeable difference in the prices paid, for his animals were no better individually than those sold the second day.

Drainage is a factor in crop production which no farmer should fail to recognize. If you don't believe it, ask a farmer who has tried it out.

Well balanced rations and careful feeding have a direct bearing on the production of your hens.

DAIRY MARKETS

SPRING GREEN, Wis., Nov. 26—Offerings of cheese on the Spring Green dairy board of trade on Tuesday was 411 boxes of single Daisy cheese. Of these 120 boxes sold at 36⅝c and 291 boxes at 36⅝c.

APPLETON, Nov. 26—Five factories offered 123 boxes cheese on the local call board on Tuesday. Sales were 61 boxes Twins at 34¾c and 62 boxes Double Daisies at 36c.

PHILADELPHIA, Nov. 26—Eggs—Higher; nearby firsts, $21.00@21.60 per case; nearby current receipts, $20.70; western extra firsts, $21.00@21.60; western firsts, $20.40@20.70; fancy selected packed, 75@77c per dozen.

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

101 Marion Street Oshkosh, Wisconsin

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Pig Weaning Trough

We all know that when little pigs are fed together in an open trough there is always more or less crowding and as a result the smaller ones are crowded out or at least are robbed of a part of their meal. These are just the ones that should be well fed, but this continual crowding and robbing keeps them in the runt class which of course means a loss. The best way to remedy this difficulty is to build some kind of a trough that will keep the pig out of the feed and give each one a fair chance. The accompanying drawings illustrate such a trough that is used on the Government Experiment Farm in Maryland. It can be built by any junior who is at all handy with tools, and if he so desires, can be made larger or smaller than the one planned. This one is large enough to hold a slop feed for 20 weanling pigs weighing about 35 or 40 pounds. It is only 3 inches deep so that the pigs can easily get at their food, but the ridge pole and cross pieces make it impossible for the animals to climb into it. Like any feed trough or box it must be kept clean, and this is easily accomplished by use of an old broom and plenty of water.

A GOOD WEANING TROUGH FOR PIGS.—IN USE AT THE U. S. EXPERIMENT FARM, MARYLAND

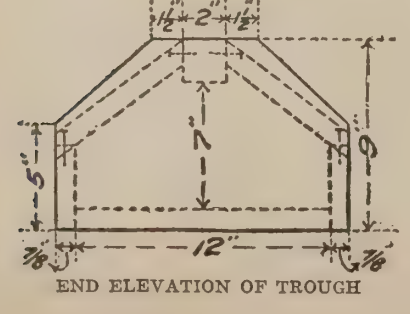
The trough is 7 feet 9 inches long and weighs only about 50 pounds, so it is easily handled and can be carried from one place to another. Lumber seven-eighths inch thick is used except for the floor and ridge pole. The floor is made from 1-inch stuff and the ridge pole which is 2 inches square can be cut from a 2"x4".

The following bill of material is necessary for the construction:

One piece 1 inch by 1 foot by 12 feet for the floor and ends. The ends can be dressed down to ⅞ inches thick or else used an inch thick.

One piece of ⅞ inches by 4 inches by 16 feet for the two sides.

One piece 2 inches square by 8 feet for the ridge pole.



One piece ⅞ inches by 1¼ inches by 15 feet for the partition pieces.

Total number of board feet, 20.

Thirty-six screws (1¼ inches, No. 9) to fasten the partition pieces.

Fifty-two nails (8-penny); 14 used to fasten each end piece to the ridge pole, sides, and bottom; 12 used to fasten each side piece to the floor.

If you don't happen to be able to secure this particular kind of lumber, you can probably find some around the buildings that will answer the purpose just as well. Thus if you don't happen to have any ⅞-inch boards, you can use 1-inch ones or else dress them down to ⅞-inch. Then, too, if you want to make the trough larger or smaller, plan it accordingly. These plans are merely suggestions.

END ELEVATION OF TROUGH

Such a trough can very well be used to teach the little pigs to eat before they are weaned, but when it is used for this purpose, fence it off in one corner of the pen with a fence that will keep out the old sow but will allow the pigs to run under.

Value of Silage—Calf Feeding

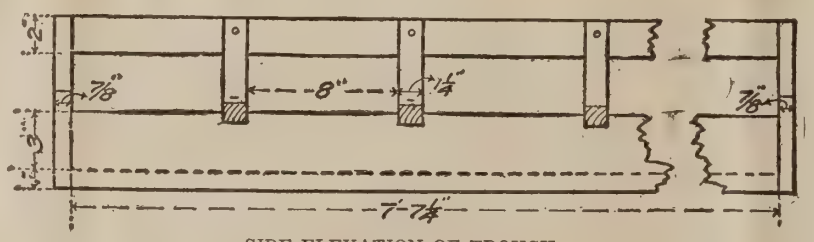
HOARD'S DAIRYMAN JUNIORS:—I would like to ask you a few questions. How much is good corn silage worth a ton? How much is good shredded fodder worth a ton? How much would skimmilk be worth a hundred? We are getting 60c for butterfat.

Would you tell me what are the best feeds you can give a calf to make it grow its best?

Minnesota. ARTHUR J. BRADY.

Corn silage is not bought and sold on the open market like grain or hay so it really has no market value. There are, however, several ways of estimating what it is worth per ton. One way is to compare it with the price of grain according to the following table issued by the Indiana Station:

When grain costs	Silage is worth
$25 per ton	$ 5 per ton
30 per ton	6 per ton
35 per ton	7 per ton
40 per ton	8 per ton
45 per ton	9 per ton
50 per ton	10 per ton
55 per ton	11 per ton
60 per ton	12 per ton



You can use this table by finding out the present market price of grain. Thus, if it is now worth $35 to $40 per ton, corn silage would be worth from $7 to $8 per ton.

We have estimates that the value of silage is one-fourth the selling price of timothy hay. For example, with timothy selling for $30 per ton, silage would be worth $7.50.

Pound for pound, shredded corn fodder contains nearly three times as much actual feed as a similar amount of silage. The silage is, however, more palatable, the cows like it better, and moreover there is less waste from it. You know from experience that when dry fodder is fed, a good deal of the coarser part is left uneaten. With silage this loss is small. Feeding experiments have proven that a ton of corn put in the silo will produce seven or eight per cent more milk than the same corn fed as dry fodder and we believe that a ton of such fodder is not worth more than twice as much as a similar amount of silage.

Just how much skimmilk is worth depends upon the cost of other feeds as well as the purpose for which it is to be used. One way of estimating its value per 100 pounds for feeding hogs is to multiply the market price of live hogs in cents per pound by 5. If it is to be fed with corn, multiply by 6. Thus, if hogs are worth 17 cents per pound, skimmilk would be worth about 90c per 100 pounds as a feed. For calves it would be worth even more.

Milk is unquestionably the best single feed for most growing animals. It is the food Nature intended for them and in this one respect at least it is a hard job to improve on Nature. The dairy calf is no exception to this rule. Milk is the feed it will use to best advantage which is why you often find breeders of pure-

SIDE ELEVATION OF TROUGH

breds feeding their calves whole milk until they are three to six months old.

This last, however, is unnecessary and certainly is expensive with butterfat at 60 cents or more a pound. Start the calf on whole milk and when it is from three to five weeks old gradually substitute skimmilk until the calf is on skimmilk entirely. A few pounds of milk a day is enough for the very young calf, but as it grows older this amount can be increased until it is getting 12 to 15 pounds daily.

Now there are certain precautions to be observed in feeding milk. First of all, keep the feed pail clean. Feed regularly and feed milk at about the same temperature each time. Irregular feeding is one cause of scours.

Milk alone will not be enough for a calf. When it is two or three weeks old it will begin to eat grain and hay if given an opportunity. Keep a little bran or ground oats in a feed box where the calf can get it at any time. Before long it will begin eating it. Then begin feeding grain regularly. A mixture of ground oats or ground corn and wheat bran will do very well, the ground grain being replaced by whole grain after the calf is eating nicely. Half a pound will be enough at first but late may gradually be increased up t pounds or thereabouts.

Clean, bright hay is another tial part of the calf ration. or alfalfa is to be preferred. A but little will be eaten but as th develops the consumption of ha increase until by the time it months old it will be eating th four times as much hay as grai move the uneaten hay each da give a fresh allowance.

McHenry County, Illinois, and Girls Do Things

McHenry County Boys' and Clubs have been making some records for their county and selves.

At the McHenry County Fai put on the best exhibit of c fruit and vegetables, corn, and on the fair grounds and at the fair they took the blue ribbon fo exhibit of fruit; blue ribbon fo best corn demonstration team ond place with their canning d stration team; fourth place i pageant; and fourth place on exhibit of canned vegetables.

These boys and girls have doing some fine work with their canned products, and pigs. mothers, what do you think of putting up all of the home fru vegetables as some of these have done? When girls und years put up between 200 an cans in a season they are sure over the top. Many of the Mc County boys are taking orde their early seed corn.

And such pigs—! You goo men should see some of these pigs. Six-month-old pigs we 200 pounds. Yes, and one pig w 268 pounds the day it was six m old.

On Nov. 29 and 30th these boy put on one of the biggest show pig sales ever held in McHenry ty. There were Duroc-Jersey, P China, and Chester White pigs, of them pure-bred. These pigs all weighed by the boys when b and a record kept of the feed.

Illinois. T. H. MURI

A Book for You

Are you interested in dairy in the feeding and care of calv the common ailments calves may and the treatment of them? you like to know more about h properly feed and care for cows? Certainly you would, fo are a junior dairyman. Ther books published on this subje not all of them are written for

Very recently, however, v ceived a little booklet covering things that was written express boys and girls who are memb calf clubs or are interested in cattle. It covers the subject ver and is written in a way that one, old or young, can understa is a "Hand Book for the Use of Cattle Clubs", by Frandsen and ens. The Nebraska Experimen tion, Lincoln, Neb., will send a to any interested person who for it.

Your Letters

We very often hear from so our junior club members who

Thomas A. Edison's Wonderful New Diamond Amberola

Sent on Free Trial!

Read the Coupon Below! An astounding offer—the New Edison Diamond Amberola, Mr. Edison's great new phonograph with the new Diamond Stylus reproducer, and twelve brand new Diamond Amberol Indestructible Four-Minute Records sent to you on ***absolutely free trial. Send no money***—just fill out the coupon below and send it to us at once. We will send you the complete outfit immediately. Entertain your family and friends with the latest song hits of the big cities. Laugh at the side-splitting minstrel shows. Hear anything from Grand Opera to Comic Vaudeville. Decide if you can get along without it. If, after the free trial, you decide not to keep the outfit, send it back to us ***at our expense.***

Only $1.00 After Trial

If you wish to keep Mr. Edison's superb new instrument after the free trial, send us only $1.00. Pay the balance of $47.20 for the complete outfit in easy payments of only $4.00 for 11 months and $3.20 for 12th month. Total $48.20. Remember, the brand new Blue Amberol Indestructible 4-Minute Records are included in outfit.

Think of it—a $1.00 payment, and a few dollars a month to get this outfit of Mr. Edison's new phonograph with the Diamond Stylus reproducer, the life-like music—the same Blue Amberol Records—all the musical results of the highest priced outfits. The *finest*, the *best* that money can buy at very much less than the price at which imitations of the Genuine New Edison Diamond Amberola are offered.

After years of labor on his favorite invention, Mr. Edison has made the music of the phonograph true to life. There is no reason now—especially since we make this rock-bottom offer—why you should be satisfied with anything less than Mr. Edison's genuine instrument. You are under no obligation on this free trial offer.

Send No Money —Just the Coupon!

Convince yourself first. Get the New Edison Diamond Amberola in your home on free trial. See how much happier it will make your home. Just fill out the coupon and send it in. No money down, no C. O. D. You pay us nothing unless you keep the outfit. Of course, we do **not** want to ship an outfit to a person who can not afford to at least pay on easy payments (and when you get a free trial it must be understood that you can **afford** to keep it). Yet, no one is **under any obligations** to keep an outfit if it is not entirely satisfactory. If it is not just what you want, return it **at our expense; you,** not we, must judge what the Edison phonograph means to you and we accept your decision cheerfully and without question.

F. K. BABSON, Edison Phonograph Distributors
4549 Edison Block, CHICAGO, ILL.
Canadian Office: 355 Portage Ave., Winnipeg

No obligation to buy in sending this coupon, this is just an application for a Free Trial

F. K. BABSON, Edison Phonograph Dist., 4549 Edison Block, **Chicago, Ill.**

Dear Mr. Babson:—As per your offer, I should like to hear Mr. Edison's wonderful new style phonograph in my own home on free trial. If I decide to keep the outfit, I will have the privilege of the rock-bottom price of $48.20, direct from you on your special terms. I merely agree to take the outfit promptly from the depot, pay the small express or freight charges, and if I do not find it thoroughly satisfactory, I reserve the right to return the outfit at once at your expense. Otherwise I will send the first payment of $1.00 within forty-eight hours after the free trial or as soon as possible, in no case exceeding one week, and will make monthly payments thereafter of $4.00 for 11 months and $3.20 for the 12th month. Total $48.20. The outfit is to remain your property until the last payment has been made. (This offer is not open to anyone under 21 years of age. If you are under 21 ask your father, mother or guardian to fill in and sign this coupon for you.)

Understand the raising of crops, dairying, use of milking machines, etc. Would accept a position with some large concern as veterinarian to look after the health of live stock. Any first class proposition will be considered. Address BOX 313, care Hoard's Dairyman.

Conserving Children

RD'S DAIRYMAN:—What would ink of a mother who would try pel her two-year-old baby to the multiplication table? You think that she was crazy or ing worse, would you not? And ow many mothers expect that machs of their babies will en- he same burden that is put he stomachs of adults. They full well that the undeveloped of the baby cannot digest the lication table. They ought to further, and realize that the h of the baby is even more un- ed than its mind.

is baby year with America, ery one who has a voice should in behalf of the abused little who are so bitterly misunderstood. We try to force their unformed minds by insisting that they know many things which they have no possible way of knowing; we try to crowd their embryo souls by giving them more or less unheeded lessons in morality and ethics; and, more than all else, we abuse their digestive organs by compelling them to eat food fitted only for hard-working adults, and then wonder why they fall ill.

I wish that it were possible to let the children have their meals entirely apart from the elders of the family, for then we could feed them just what they most need, without tempting them by the proximity of food fit for older persons. If every child could have proper food, well prepared and fitted to its needs, there would be less than half the illness that is now prevalent among children, and infant mortality would be reduced to an unbelieveable figure.

The only food for a baby under one year of age is mother's milk, and if for any reason the mother finds it absolutely impossible to nurse her baby, she should modify cow's milk in such a way that it will closely approximate the milk of the mother. The much-vaunted prepared foods do well in some ways, but they are composed largely of cereals, and there is too much starch in them for the baby under a year old. I admit that many babies seem to be doing well upon these prepared foods, but if a crisis comes in the condition of the child, the breast fed baby has more than double the chance of the bottle fed baby. And the bottle fed baby who is given modified cow's milk has a much better chance than the baby fed on prepared foods.

Any reliable physician can give you a formula for the modification of cow's milk, but if there are those who are too far from town and a doctor to rely upon his advice, I will give the formula that was given to me.

Cow's milk contains too much casein, or curd, and too little sugar, as compared with mother's milk. So we must remove the excess casein, and add the necessary sugar, to make an ideal food for baby. Let a pint of milk stand over night, and remove the upper third, reserving it for future use. To the two-thirds of a pint of skimmilk that remains, add a crumb of junket tablet no larger than a half of a grain of wheat. Dissolve this in a few drops of water, and when it is dissolved, add to it the skimmilk which has been warmed to blood temperature. Stir thoroughly, and set aside until it forms a curd, like clabber, but not sour. Ten minutes is usually enough, and sometimes five minutes will do the work. Break up this curd, and strain it out; add the other creamy third of the milk to the whey, sweeten with sugar of milk, about a half teaspoonful to the above quantity, and feed with a bottle.

By the use of this formula, you avoid the use of starchy cereal foods, granulated sugar, and too much casein, and it would be wise to prepare enough at one time for several feedings, that is, if you are sure you can keep it sweet. Nothing else but cool, fresh water should be given to the baby, but as he grows older, a little more of the milk may be retained in the portion skimmed off, so that he will gradually grow accustomed to a stronger food. It will not hurt baby to live upon this food alone until he is sixteen or twenty months old, and that would be far better than giving it any kind of food that is too heavy for it.

If, in spite of care, baby does poorly, or is taken ill, seek the best medical advice at once, for a human life is just as precious in the case of a baby as that of any adult. Conserve the babies that we already have rather than add more undeveloped, poorly nourished children to the population. Two babies that live and thrive are worth more to a nation than a dozen that linger along for a year or two, then give up life with nothing to show for their having lived.

ADA CARROLL WORTMAN.

Nebraska.

After Supper on the Farm

HOARD'S DAIRYMAN:—To busy folks in the work-a-day world the time after supper is the best time of the day. Whatever leisure we have usually comes at that time. What an opportunity for delightful times is ahead of you during the months to come!

Why not even now in the fall begin to plan for the winter? Have you thought at all how you can best use those long winter evenings? If you have given the matter any thought at all, have you decided to make the reading of some good books a part of your program?

Everything considered, perhaps nothing will give more genuine and lasting pleasure than a series of evenings spent with books that will give information, amusement, and inspiration.

Perhaps for some time you have wanted to read books giving suggestions on the best methods of farming such as Coulter—Co-operation Among Farmers. Perhaps you are the "director of the household" and have wanted for a long time books on home-making. Perhaps you are a high school graduate back home on the farm again helping Uncle Sam by "doing your bit" to help feed the world. Though you are not on the firing line, you will want to know what is happening along the line of battle. "My Home in the Field of Honor" and "How Belgium Saved Europe" are two books that will give you a clear picture of what war means. Books on all phases of the war have been published since the war began. Perhaps you may be just anybody interested in a number of things—books on history, books about our country, on biography, on travel, or books of fiction having nothing more to commend them than that they are good stories. Among kinds of books referred to above are the following: "Spell of the Rockies", "Twenty Years at Hull House", "Russia in Upheaval", "The Dark People", "The Amazing Interlude".

Whatever your line of interest, it is possible to get just the sort of books that you want. No longer can it be said, "I'd like to read that book but I haven't any way to get it. The city with its library offers to the city people the books they want to read. So, is it not fair that the state should, through its Library Commission, offer the people of the state who do not live in library centers, the books that people in the villages and country want to read? The state of Wisconsin thinks so.

Do you know that upon application to the Library Commission any Wisconsin community can get a traveling library for the use of all the people? All that is necessary is for five responsible people to sign an application card and the traveling library will be sent. Information and application cards are sent to anyone who asks for them.

As you read this why not make up your mind that you will find out further how Wisconsin supplies her people with books, if they want them. Send a post card to the Traveling Library Department, 604 University Avenue, Madison, Wisconsin, asking for an application card and for circulars of information. Then tell your friends about it. Interest them in the idea. When the card reaches you from the Commission, sign it yourself, get four other people to sign it, return it to the Commission, and begin to look for your traveling library. It will be sent promptly upon receipt of your application and should reach you a week or two later. Allowances must, of course, be made for the time needed in freight shipments.

Sometimes local conditions are such that it is a little difficult at first to get a traveling library started. In such cases individuals may secure one or more books by writing in person for them. The Commission through its parcel post arrangement will see that books are supplied by mail.

JESSIE WEDIN.

Wisconsin Library Commission.

Do *you* think there is no competition?

If anyone thinks there is no competition amongst the big packers he ought to go through a day's work with Swift & Company.

Let him begin at the pens when the live stock comes in; let him try to buy a nice bunch of fat steers quietly and at his own price, without somebody's bidding against him.

Let him realize the scrupulous care taken at the plant that not one thing is lost or wasted in order that costs may be held to a minimum.

Let him go up into the office where market reports are coming in — and reports of what other concerns are doing.

Let him watch the director of the Swift refrigerator fleet, maneuvering it over the face of the country like a fleet of battleships at sea.

Let him take a trip with a Swift & Company salesman and try to sell a few orders of meat.

Let him stay at a branch house for an hour or two and see the retail meat dealers drive their bargains to the last penny as they shop around among the packers' branch houses, the wholesale dealers, and the local packing plants.

And then, when the day is over, let him have half an hour in the accounting department, where he can see for himself on what small profits the business is done. (Less than 4 cents on each dollar of sales.)

If he still thinks there is no competition in the meat business it will be because he wants to think so.

Swift & Company, U. S. A.

A nation-wide organization owned by more than 23,000 stockholders

The Farmer and War Price

HOARD'S DAIRYMAN:—Almost ev where one sees a group of people gether he will hear some phase of war discussed. If it is not the "w ern front" it may be the draft, conservation, or how rich and p perous the farmer is with eggs r than four cents each and other p ucts at undreamed of prices. I heard this latter question argued and con and to satisfy my own osity I set about to find the trut the matter, in part at least.

I began farming operations for self in the spring of 1916 and so in good position to know somet about cost prices then, and with aid of my farm record and the Book of the United States De ment of Agriculture, together present local prices, I felt that I some material at my disposal. I twelve articles that the farmer h buy and twelve that he had to se figured the 1916 price, the price, and the increase in per ages. The articles were picke random, no effort being mad choose those that would benefi farmer. The figures in each were made to cover as much o year as possible and in some were the averages for the yea shown by government reports. following tables give the resul my effort:

What the Farmer Has to Buy

Article	Price 1916	Price 1918	Pe In
Plow Paints	$ .33	$ 1.00	
Walking plow	13.00	32.00	
Sulky plow	35.00	60.00	
Manure spreader	110.00	190.00	
Grain binder	135.00	225.00	
Binder twine	.10	.26	
Nails	.04	.08	
Hay rope	.18	.37	
Mower	45.00	85.00	
Barn siding	28.00	48.00	
Cultivator (riding)	35.00	60.00	
25th Lever harrow	25.00	45.00	
Average increase			

What the Farmer Sells

Article	1916 Price	1918 Price	I P
Butterfat	$ .33	$ .47	
Poultry	.15	.27	
Eggs	.25	.37	
Hay	10.00	20.00	
Oats	.43	.75	
Barley	.80	1.20	
Hogs	.10	.20	
Cattle	.08	.16	
Wheat	1.60	2.10	
Rye	1.25	1.40	
Corn	.70	1.60	
Apples	.90	1.00	
Average increase			

According to these tables th terials the farmer has to buy ha creased in price 102%, while w has to sell has increased in pric 71%, or a difference of 31% purchasing price of a farmer's is 31% less than it was before, am sure no one likes a 69-cent

There is still another side question which must not be looked and that is the labor qu The farmer has been confronte a serious labor shortage, yet g ment reports show that the p tion of foodstuffs has increa spite of a decreased supply o labor. One report showed the an increased production in foo of 26% with a decrease in la 16%. This means that every vidual farmer is working harde previously. In fact, two men n producing nearly as much f three men did before the war such inroads upon our labor. brought about partly by inc machine work, which means creased investment, and partly increased effort on the part farmer and his family. The is working overtime, for whic borer in our shops and factor ceives pay and a half or doub

A Soldier's Letter

Future of Dairying

HOARD'S DAIRYMAN:—It is quite proper to devote all the news space to the war, for right now it is the main issue of the day, but I want to slip off on a little side path for a few minutes and dwell on the days before the war.

Turn back the pages of time and let's talk about the Wisconsin dairy products and the farm.

I sure miss my copy of Hoard's Dairyman but that can't be helped for the mails are very heavy from the states with letters so I must forego the pleasure of Hoard's Dairyman.

Every once in awhile I see a can of milk from Wisconsin and it sure makes me think of the farms, creameries, and cheese factories back in the good old U. S. A. I haven't had much of a chance to see any of the modern English farmers but hope to have a chance to look 'em over before returning home.

I'm going to aim to secure all the data I can from the English Department of Agriculture on the subject of the dairy products of England.

I left the states early in March so have had some chance of looking around a bit over here and I honestly wish I were competent and had the ability to picture to the American dairy farmer the great future possibilities in store for them.

Before I left home I heard farmers say, "Oh, I'm going to sell my cows—feed is too high and my income too small, etc." If these same farmers could only look ahead and realize what their herd is going to be worth as soon as we knock the war ideas out of Kaiser Bill, they would change their tune and would scratch and pinch to increase the herd. There is going to be an unheard of demand for good cows and the fellow who is foresighted enough to raise calves now is going to reap his harvest as soon as peace is declared.

You see I haven't read a copy of Hoard's for some time so don't know what you are doing along these lines. But if you will permit a suggestion from a soldier from Wisconsin, tell the cow man to prepare now for what is coming very soon—peace and a call for good cows and more cows.

You read the late war news in the daily papers so I won't spend any time discussing that subject, but want to say this much—the Yanks are in the battle and they sure are doing themselves proud and as the song goes: "We won't come back till it's over, over there". Will be glad when that happy day comes so we can return to our homes and once more have our loved ones with us.

The writer and his wife and an 11-year-old boy all used to get a lot of good dope from Hoard's so I figure you'd appreciate hearing an old reader say his copy is missed.

With best of wishes for the success of all your undertakings.

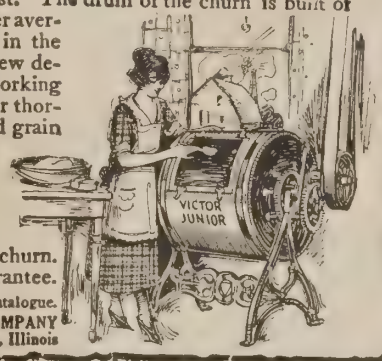
J. H. MCVAY.

Convalescent Camp, England.

All animals require plenty of good, pure water. This is especially true of the milking cow, as water constitutes more than three-fourths of the volume of milk. Stale or impure water is distasteful and she will not drink enough for maximum milk production.

Victor Jr. Churn

Practical and Complete—a Combined Churn and Butter Worker.



The Churn That Helps You to Make Firm Butter

The **Victor Junior** Churn puts butter making on the farm on a level with creamery butter making. It keeps the temperature down much better than the ordinary churn both during the churning and the butter working.

The mechanism of the churn is such that it will not only churn quickly but will get all of the butter. It also preserves the butter from dust and flies because when the churning is done, the butter can be salted and worked right in the churn. It does not have to be removed until finished.

To get the best butter, the temperature of cream for churning should be from 50° to 60° F. according to the density of the cream. A rich or dense cream requires a lower temperature than a thin cream. Having the cream at the right temperature to start with counts much in producing firm butter of good appearance.

The Victor Jr. will do the rest. The drum of the churn is built of heavy, well seasoned lumber. Under average conditions the temperature in the churn should not rise more than a few degrees during the churning and working process. The rolls work the butter thoroughly. It comes out with a good grain and firm.

We make and sell more churns for creamery use than all the other concerns combined so you can depend on our recommendation of the Victor Jr. as the ideal farm churn. It is covered with our iron clad Guarantee.

Full information in our Dairy Supply Catalogue.

When You Buy a Tractor—

REMEMBER, it's the plows, disks, drills, binders, ensilage cutters, feed grinders, threshers and the like that do your farm work. The tractor is useful only as it furnishes cheap, dependable power for **all** the other machines.

That's why we say, if you need a tractor, you can't make a mistake in buying an **International kerosene tractor.**

We have had over 75 years' experience with farm machines. We know the kind of power they require—all of them. For over twelve years we have sold tractors that supplied that kind of power. We know from experience that the sizes and styles of tractors we sell today will work with the machines you depend upon for your success and prosperity. And—our tractors all operate successfully on cheap kerosene.

When you buy an International kerosene tractor you buy with it the benefit of our long farm machine experience and all the advantages of dealing with a service organization which brings a well stocked branch house or a live, wide-awake retail dealer within telephone call of you. It may surprise you to know that an International tractor, plus these advantages, which no one else can give, costs you less per year of active service than any other tractor sold in anywhere near the same numbers.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Relief. Gombault's Caustic Balsam will give you immediate external applications. A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

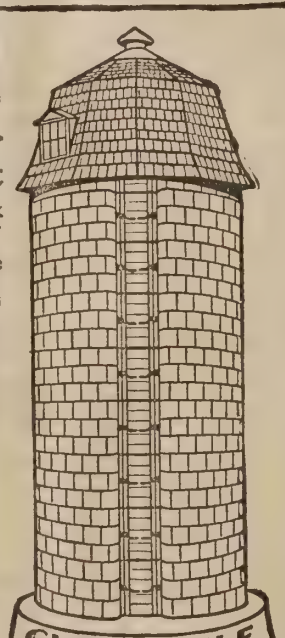
Gombault's Caustic Balsam
The Great French Remedy Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

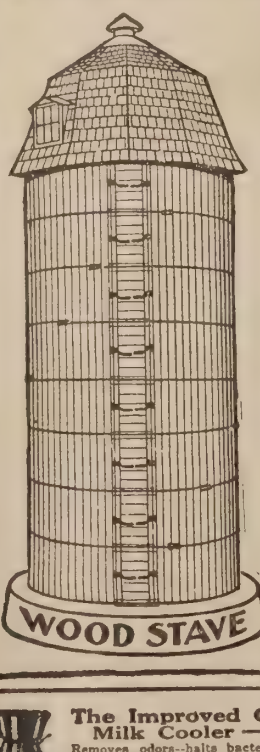
"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.



Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."



A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.75 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

Abortion Work in Kansas

Educational work in prevention of abortion disease in dairy and beef herds is now being developed by the Kansas State Agricultural College in co-operation with the U. S. Department of Agriculture. As explained by Dr. Geo. M. Potter, who has it in charge, the purpose of this work is to demonstrate not only that it is possible to control the disease by a system of sanitation and herd management but that such a practice will be profitable to the owner of the herd. The work will be of a demonstrational nature. Where regulatory measures should be adopted the live stock sanitary commissioner will be immediately notified. In farm bureau counties the work will be conducted under the auspices of the farm bureau.

It is proposed to secure the co-operation of the owners of dairy herds, two or three in each eight or ten counties in different sections of the state, and a like number of owners of beef herds in four or five counties which are typical of their respective sections, who are willing to try for a term of years our plan of herd management to overcome this disease. In choosing co-operators, only those men who have had losses in the past and realize the necessity for instituting preventive measures should be accepted. The proposed work will require the intelligent interest and active co-operation of the owner, as one who would not follow a definite system of herd improvement would derive no benefit from it. The assistance and active co-operation of one or more local veterinarians will be sought in every case so that they may be fully informed of the methods used and thus be ready to apply similar treatment and management to other herds in the community whose owners become interested in results in the demonstration herds.

It is desired to work wherever possible with pure-bred herds, or in the case of dairy herds with those connected with cow testing associations. Where such herds are not available good grade herds may be used. In working with such diseases as abortion, which is of a chronic nature, the work must continue over a period of years before results become apparent, and it is essential that there be a continuity of purpose such as the pure-bred and testing herds seem to offer. Moreover, this class of cattle are more frequently used as foundation stock in the development of new herds, and are, therefore, potentially more dangerous disseminators of disease. They afford the most logical point of attack in any plan of herd management for disease prevention. The work will be directed along the following lines: Prevention of abortion disease and allied affections, prevention of calf diseases, and veterinary service.

At first, only general measures such as sanitation, segregation of aborters, and proper methods of herd management will be instituted. On subsequent visits when the work shall have been organized, the special measures for the treatment of aborted cows, retained afterbirth, and sterility will be demonstrated; also laboratory diagnosis will be made, as opportunity offers, in co-operation with the Veterinary Department.

Records of breedings, calvings, abortions, retained afterbirths, sterility, etc., will be kept to facilitate the work as a means of recording progress.

In outlining systems of herd management, the specialists in dairying and animal husbandry will be consulted. Conditions are so varied that each herd becomes a study in itself, and expert advice is necessary in each case.

A detailed discussion of the dis-

Retained Afterbirth

When the membranes remain in t uterus of a cow and decompose, flammation of the lining of the wo may be caused, and this, with the sorption into the blood of the produ of putrefaction, leads to ill-heal emaciation, diminished milk supply f ure to breed, and often blood pois ing and death.

Hood Farm Breeding Powder

causes the afterbirth to come aw naturally in a few days, and thorou ly cleanses and disinfects the parts, le ing the cow in normal condition breeding.

"After four years of experienc find Hood Farm Breeding Powder v necessary, for keeping my herd fr aborting. It cleans the cows out qu ly and clean, they breed early and sure to stand."

Stuart Bird, Cropper, Ky

Try Hood Farm Breeding Pow once and you will never again forc remove the afterbirth.

Prices prepaid $1.15, $2.75 and $5.00. F ble Injection Tube, by mail, 90c. Mam size Breeding Powder and Tube, prepaid, $ Mention this paper.

The Guaranteed Milker

THE PERFECTION is made for the man who wants a milker he can depend on. Month in and month out, summer and winter, the Perfection does the milking without balking or breaking down. With the Perfection there is no complicated mechanism to operate and no clockwork to get out of order. It is the guaranteed milker with a reputation for reliability, simplicity, and mechanical perfection.

Milks Like The Calf

The sucking calf and not the human hand is the original milker. The calf sucks on the teat, squeezes it towards his throat downward with his tongue and the roof of his mouth, then stops sucking momentarily while swallowing. When the calf stops sucking, the blood in the teat flows back into the udder.

The Perfection Teat Cup is the one which faithfully reproduces these three actions of gentle suction, downward squeeze and a period of complete release. That is why such famous dairymen as G. G. Burlingame, of Cazenovia, New York; Grahamholm Farm of Rochester, Minnesota, and G. K. Herzog & Company of San Anselmo, California, use the Perfection on their valuable cows.

Keep More Cows

You can increase your herd and make more profit, in spite of labor problems, if you have a Perfection to help you. One man with a Perfection can do the work of three men at milking time. In an emergency, your wife or daughter can do the milking.

"What The Dairyman Wants to Know"—Free

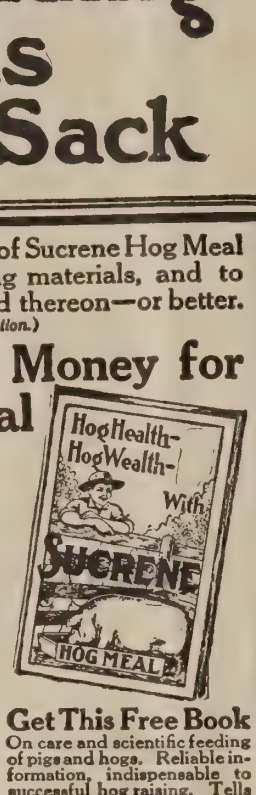
SUCRENE HOG MEAL

68 Pounds Body Building Nutrients in Every Sack



We positively guarantee every sack of Sucrene Hog Meal to contain only the high quality feeding materials, and to carry the strong nutrient analysis, printed thereon—or better.
(Note print on sack in above illustration.)

Profs. Henry and Morrison on Ready-Mixed Feeds

"Many mixed feeds are the result of honest and intelligent efforts to furnish a ready mixed, balanced concentrate mixture for various farm animals. Such have won good reputations among intelligent feeders.—All mixed feeds should be purchased, on the guarantee of the amounts of crude protein, fat and fibre in the mixture. When in doubt as to the merits of a feeding stuff, one should consult the feed control officials of his state, or buy only the pure, unmixed grains, straight milling or factory products, *or high-grade proprietary feeds that have won good reputations.*"

You Know What You Pay Your Money for When You Buy Sucrene Hog Meal

We have nothing to conceal about Sucrene Hog Meal. We give you a correct list of all the materials that go into its manufacture, the high feeding value of which is known to all experts on feed stuffs. Sucrene Hog Meal never varies in nutritive quality, no matter how high the prices of raw materials may go. Our buying and manufacturing facilities enable us to maintain in Sucrene Hog Meal the standard pork producing value which has gained for it

The Enthusiastic Approval of Leading American Hog Raisers

Miller Bros., Carlos, Ind., raisers of Big Type Poland Chinas: "We consider Sucrene Hog Meal the best feed we have ever fed for raising fine healthy hogs."

Herbert Benson, Newark, Ark.: "I think Sucrene Hog Meal the best feed I have ever found. My young stock is coming good. Enclose check for another sack."

G. T. Smith, Winter Garden, Fla., "My hogs like your Sucrene Hog Meal and I believe are making better gains than with any feed I have ever used."

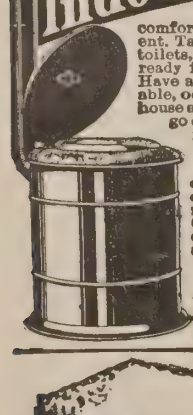
Whitehead Bros., Carlos, Ind. "Nineteen pigs gained 113 pounds each in 42 days on Sucrene Hog Meal—an average of 2.7 pounds per day."

Get This Free Book
On care and scientific feeding of pigs and hogs. Reliable information, indispensable to successful hog raising. Tells about diseases of hogs, prevention and cure.

More Pork per Pound of Feed Than You Ever Got With Corn

Sucrene Hog Meal has a record of producing twice as much pork per ton as good corn. Its nine different high-quality ingredients nourish the hog completely—no corn or tankage needed. Strong protein and fat making materials correctly balanced, with necessary ash and mineral matter, build a large, strong frame and firm, solid flesh. Blood Flour and Pure Cane Molasses are special health promoting materials not found in ordinary hog feeds. They are strong in animal protein and carbohydrates, practically 100% digestible. They reduce chances of loss by disease, whet the appetite, aid digestion—hogs eat more and turn all their feed into high-quality pork.

Feed Sucrene Hog Meal dry or slopped. Order a ton from your dealer. If he can not supply you promptly write us. Coupon or a post card brings you full information and free illustrated literature.



Better place your order at once to avoid transportation delays which are confidently looked for in the near future by all shippers.

Progress of Missouri Silo Campaign

"How is the silo campaign get on?" This question is asked daily it suggests that other people as as the farmers in Missouri are i ested in knowing what has been and what is to be done in the fu in conducting the silo campaign.

After the preliminary meeting 000 copies of the four-page circ "Build Silos and Win the War", printed and distributed. In add to the circular, 5,000 large illustr patriotic silo posters, "Your Cou Calls", were secured. This post printed in attractive colors, illus ed with a group of soldiers ru forward near the top and a silo i lower left-hand corner, and the fo ing silo information: "40 per ce the crop wasted when left in the a silo saves 10 cents on the produ of one pound of butter, $1.50 o pounds of beef or mutton, an cents on a 100 pounds of milk."

Another 5,000 of large illust patriotic silo posters, "Help U Sam", were secured. This post printed in the national colors, trated with a picture of Uncle pointing to a silo around whi group of cows is standing. It als tains the following advice of Sam: "Put your corn in a silo save millions of dollars; a silo food for stock as the can save man."

Up to October 1, eleven c agents, district agents, emer demonstration agents have indic wish to have a silo campaign put their territory. In addition to th chairmen of county councils of d have expressed the same desire, these from counties in whic county agent is employed.

As the campaign has progress increasing number of letters ha received from farmers who d literature or direct information construction of silos, the filling same, and of the feeding of Naturally a majority of inquir late to the condition and best the present corn crop.

Up to October 1, reports of t survey have been received fr counties. These reports conta name and address of every ma has a silo and of other farme intend to build one within the Although some school distri these counties have not yet been from, the reports received sho in these 34 counties there ar 1302 silos and that 1524 farm tend to build silos in time to some of their next summer's crop. We may safely estimat after all reports are in from counties, the number of silos built will be at least 1700, or 5 county. If the other 80 counties state will show the same inte silo building, more than 6,00 will be built in Missouri befor fall.

As soon as reports are r from school district clerks, a c letter is mailed to each farm intends to build a silo, in whic advised to consult his county to get literature of the differe manufacturers, to compare the and prices of the different ki silos, to build a silo early next summer so that, if it is crete or tile, it may be thor seasoned before the time of fil order to secure possible reduct freight rates and prices, farm advised to join in a group a the same kind of silo in the ne hood. The circular letter con list of bulletins that relate t and silage, with the suggestio the farmer should indicate by mark the bulletins that he wo to receive, give his address

turn the sheet to the Extension Department of the Missouri College of Agriculture. It is believed that this method of helping those farmers who intend to build a silo will lead to good results in the selection of silos, in the building of silos, in the filling of silos, and in the feeding of silage to farm animals.—F. G. KRAEGE, Director Silo Campaign.

Federal Loans to Farmers

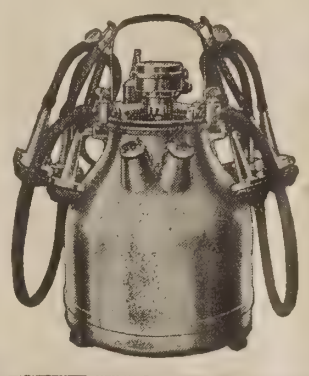
During the month of August $7,685,245 were loaned to farmers of the United States by the federal land banks on long time first mortgages according to the monthly statement of the Farm Loan Board. The Federal Land Bank of Spokane leads in amount of loans closed, $1,155,410; with the Federal land bank of St. Paul running second, $919,200. The other ten banks closed loans in August as follows: Wichita, $702,100; New Orleans, $699,465; Houston, $683,765; Columbia, $607,215; Omaha, $595,300; Louisville, $592,800; Springfield, $448,250; St. Louis, $432,840; Berkeley, $426,400; and Baltimore, $423,500.

On September 1 the total amount of mortgage loans placed since the establishment of the Federal land banks was $124,877,354 covering 55,325 loans closed. During August 2,500 applications were received, asking for $8,175,040. During the same period 2,297 loans were approved amounting to $7,686,245. Altogether 99,070 have applied for loans under this system, aggregating $258,493,125.

The grand total of loans closed is distributed by federal land bank districts as follows:

Spokane	$19,359,695	St. Louis	$8,243,130
St. Paul	17,804,100	Louisville	7,962,000
Omaha	14,517,340	Berkeley	7,609,100
Wichita	13,595,000	Columbia	5,925,790
Houston	11,253,999	Springfield	4,839,695
New Orleans	9,050,305	Baltimore	4,717,200

Progress



DO you still milk your cows by hand? Do you have three men on your pay-roll when likely one would do? Using two Burrell Milkers, one man can milk the same number of cows that three men milk by hand. At the present high cost for labor the saving resulting from the Burrell System would very soon equal the cost of its installation.

The operating cost of the Burrell Milker is almost nothing, its repair expense is very little; while the life of the milker is exceedingly long. It is an investment which yields a high rate of profit.

The Burrell (B-L-K) Milker has many exclusive mechanical advantages. An Automatic Connector provides just the exact amount of suction required to milk each individual cow—less force for the easy milking cow and more for the hard milker. The action of the Burrell Connector is automatic in every function—you can forget it's there. Other mechanical advantages found only in the Burrell Milker are the Universal Single Compartment Cup, Partition Pail and Positive Suction Trap.

There are many Burrell Milkers operated for more than ten years which make greater profits today than ever before.

Write for the Burrell booklets; learn how other dairies have increased their profits.

Makers of "Simplex" Cream Separators and other "Simplex" Specialties. The Best in the World

Nothing Is More Important

DO YOU think of *Digestibility* as being just a big, vague word which has little or nothing to do with anything in particular in your line of business?

Or do you think of *Digestibility* as being something which really has some definite connection with the amount of money to be made from the dairy?

There isn't a thing about the dairy business any more important than *Digestibility*.

BUFFALO CORN GLUTEN FEED

When you pay a good price for coal to burn in the heater, and get a lot of clinkers, you don't think you got your money's worth, do you?

You are up against the same thing in feed. Feed that runs 'way down in *Digestibility* is just as poor a buy as clinkery coal.

Feed has to break down and get through the cow's digestive tract in order to make milk. Unless a big share gets through, you lose.

1,614 of the 2,000 pounds in a ton of Buffalo Corn Gluten Feed are milk-bucket possibilities. Look over the list and see what runs higher in *Digestibility*.

CORN PRODUCTS REFINING CO.
CHICAGO NEW YORK

for Contagious Abortion

Don't sell the aborters. Clean out the infection. Breeding animals are worth more than ever before. Control of Abortion is doubly necessary.

Every time a cow drops a calf—whether alive or dead—by premature birth or aborting, whether the afterbirth is retained or not, her reproductive organs should be flushed out once or twice with B-K. The Abortion infection develops in the uterus and vaginal tract. This infection causes Barrenness, Retention of Afterbirth and Calf Scours in addition to Abortion. Unless checked it is likely to run through your entire herd.

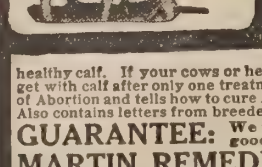
B-K is a powerful non-poisonous antiseptic—scientifically correct for this work. Used as a douche, it dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K is much more effective than lysol, carbolic acid, Lugol's solution, bichloride of mercury and coal tar disinfectants, all of which tend to coagulate or thicken the albumins.

Contagious Abortion is being successfully controlled in many herds by following our simple plan with B-K. A well known breeder of registered stock says:

"I have been using B-K according to directions and the results have been very gratifying. My cows have every one passed the time for aborting and are calving all right in a natural way. I had lost $1,500.00 on my cows and feel that B-K has cleaned up the trouble entirely.'"

B-K is sold by Dairy and Farm Supply Dealers, General Stores, Druggists, etc. If your dealer does not have it, send us his name.

There are over "145 Farm Uses" for B-K



FREE BULLETINS: Send for our valuable bulletin No. 52, on "Contagious Abortion," also "145 Farm Uses" and our "Trial Offer."

"Come On, Wisconsin"

HOARD'S DAIRYMAN:—There has never been a time when dairying had as prosperous an outlook as at present. Despite the disadvantages which loom before those who are reluctant about starting a dairy herd, farmers who have the foresight to improve and add to their herd good dairy cows will reap the harvest in the near future.

There are two obvious forces which have been operating within the last four years to bring dairying to the front. One is the wholesale slaughtering of dairy cows in the warring nations of Europe, and the second is the comparatively high prices of dairy products which prevail. The extensive advertising which dairy products will receive, after their true worth become better known through scientific findings and methodical advertising, will cause them to not only maintain their present prices with the approach of normal times, but to go higher.

The dairyman who has kept abreast of the times, by culling out the boarder cows and raising the standard of production for his entire herd, is on the road to signal success. If he has gone one step further and introduced into this herd one or more pure-bred heifers of known merit (it is assumed he already owns a pure-bred bull) he has a second avenue of success open to him.

The dairy world is looking to the United States for dairy stock with which to replace and rebuild the destroyed dairy herds, and no state in the Union has a better claim to a big share of this patronage than the Badger state. We need not feel alarmed about the demand, but we should consider seriously the supply. Is it adequate and is the quality all that we could desire? It has been my observation that we are wanting in both. I will not gainsay that the numbers may be sufficient, but the total would be seriously curtailed should we apply the standard of excellence to every herd. Too many cows are kept as family heirlooms rather than because of their meritorious qualities.

The test of merit should be applied to every herd by means of the scales and Babcock test, and the undesirables sold for meat and replaced by those which will stand the test. This can be done now when price of meat is high and feed too costly to feed to cows merely because they can chew.

Contemporaneous with other lines of preparedness for meeting conditions which will arise after the war, the enterprising farmer will fall in line and see to it that he, too, is prepared to answer the call that is bound to be echoed around the world for dairy cows that can pay for their maintenance and return a profit to their owner. Come on, Wisconsin dairymen, lead the world in raising the standards of dairy cows, as you have and are leading in numbers.

Wisconsin. THOMAS M. OLSON.

G. A. Uitdenbogerd, one-half mile west of Rosemount, Minn.

How About a Herd Sire?

MUTUAL FOBES LONGFIELD DEKOL 82959
A Splendid Son of His For Sale.

The Calf—M. M. Tritomia Fobes Longfield was born Feb. 2, 1918. He is nearly white, as straight as a line, and very well grown.

His Sire—Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters and a large number of younger ones coming on that will be retained in our herd. His sire is one of the good sons of Mooie Mutual DeKol and his dam, a daughter of Homestead Jr. DeKol, made 30.04 lbs. butter, 630.80 lbs. milk in 7 days as a jr. 3-yr.-old; 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days. (World's record when made).

The Dam, Milford Tritomia Fobes Homestead, a daughter of Canary Fobes Bessie Homestead, made 17.35 lbs. butter, 358.2 lbs. milk as a jr. 3-yr.-old; the second dam 17.38 lbs. butter, 408.3 lbs. milk; third dam 22.19 lbs. butter, 488.40 lbs. milk.

This is an excellent combination of breeding, the sire of this youngster and his dam's sire both being from daughters of Homestead Jr. DeKol, both with records above 30 lbs. butter and 600 lbs. milk.

The calf is priced within reach of any small breeder. Write us today for complete information about him.

MILFORD MEADOW'S STOCK FARM, Lake Mills, Wis.

GUERNSEYS We have an excellent lot of grade and pure-bred Guernsey females. Can supply a carload of cows and heifers due to freshen before winter. All in calf to good sires.

PERCHERON HORSES We have several registered fillies and young stallions; also two aged stallions that we will sell for less than their real value if taken at once.

DUROC JERSEYS Anything you want in Duroc Jersey Swine.

All cattle sold on a 60-day retest guarantee. Write us at once before the best ones go.

EDGEWATER STOCK FARM, Fort Atkinson, Wis.

Sir Inka Prilly Segis Albino

Born Dec. 3rd, 1917.

A Real Bull For Some Small Breeder.

IF YOU ARE A SMALL BREEDER or beginner in the Holstein business and in the market for a herd sire, here is one that is worthy of your best consideration.

JUST A YEAR OLD—Ready for service. He is well grown, a splendid individual with faultless topline and marked nearly all white. As an individual he will suit the most particular.

SIR INKA PRILLY SEGIS, his sire, is one of the famous sons of the great King Segis, who has proved himself to be one of the greatest, if not the greatest, transmitting sires of the breed.

THE DAM OF SIR INKA PRILLY SEGIS is Inka Prilly with a record of 30 lbs. in 7 days. She is from a 25-lb. daughter of old Prilly and sired by a grandson of this same famous foundation cow.

THE DAM OF SIR INKA PRILLY SEGIS ALBINO is Princess Douglas Urmagel, a 24-lb. four-year-old daughter of Sir Urmagel Burke, a full brother to the 35-lb. cow, Urma Burke, and from the 31-lb. cow, Urmagelsche 2d A.

PRINCESS DOUGLAS URMAGEL is from a 29-lb. four-year-old daughter of DeKol Beets Segis, another well known son of King Segis.

THE THREE NEAREST DAMS of this young bull average over 28 lbs. Two of them being only four-year-olds. His seven nearest dams average 26.93 and his eighteen nearest dams average 26.77.

HE CARRIES THE SAME RELATIONSHIP TO King Segis as Segis Fayne Johanna, the only 50-lb. cow, Fancher Farm Maxie, the world's champion heifer with 47 lbs., and Mabel Segis Korndyke, former champion four-year-old with 40.32 lbs.

HE CARRIES A DOUBLE CROSS of both King Segis and the famous foundation cow, Prilly,—both animals familiar to breeders from coast to coast.

AND WE ARE OFFERING this young bull to you for $650, guaranteed sound in every respect and tuberculin tested by Federal veterinarians.

IF YOU WANT HIM, do not wait to write but send us a wire instructing us to hold for you.

The E. C. Schroeder Farms, Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

If You Want Milky Bulls

Write at once

Winship Stock Farm, Owatonna, Minn.

Why Not Buy Colantha Aaggie Perfection

whose dam produced 13.8 fat in seven days and 450 pounds butter in ten months, for your herd sire? Write for price and pedigree.

J. DIEDRICH, - SUMNER, IOWA.

Owing to Long Continued Illness—

I have decided to sell immediately part or all of the Lakeside Herd, including heifer calves, yearling heifers, bred heifers, cows and bulls of various ages, several of them from dams with records of 30 to 35 lbs. butter in a week. A rare chance for parties who wish to breed a high class, embracing individuality, breeding and production. **E. A. POWELL,**

904 W. Genesee St., Syracuse, New York.

A Rare Chance

To secure a few choice

Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.

River Meadow Farms, Portlandville, N. Y.

A SON OF KING OF THE PONTIACS

The World's Greatest Proven Sire

For $350

This is half his value—but his color is against him, as he is nearly all black. He was born in August, is a splendid individual, and is out of a 19-lb. 3-yr.-old. Don't miss this chance of a life time.

Geoffrey G. Burlingame, Cazenovia, N. Y.

A Chance to Buy a Son of King Korndyke Sadie Vale

At less than half his value, because he is dark in color. $400.00 buys King Korndyke Segis Johanna Ormsby, born Aug. 17, 1918. He is a large growthy fellow and a fine individual. His dam and sire's dam average over 35 lbs. butter in 7 days. Sire:—King Korndyke Sadie Vale, regarded as the greatest sire of his generation. His daughters, still heifers, are making wonderful milk and butter records. One K. K. S. V. Topsy made over 40 lbs. butter as a 3-yr.-old. He also has two other 3-yr.-olds with records over 30 lbs., and two 4-yr.-olds over 30 lbs. He is the sire of the youngest 29-lb. heifer of the breed. Dam:—Anna Johanna Ormsby, A. R. O. record as follows, butter 7 days 29.35, 30 days 122.30 lbs. She is one of the best daughters of Sadie Vale Sir Ormsby. Thus this young Bull has a double cross of old Sadie Vale Concordia.

W. D. ROBENS, POLAND, NEW YORK.

Holstein Heifers

325 High grade heifers 1½ to 2½ years old, bred to freshen this fall and early winter, large, well marked, fine condition.

50 Registered yearling heifers, beautifully marked, very well bred, good size, nice condition, extra fine lot.

35 Registered heifers, bred to freshen early this fall, practically all springing now, fine individuals, bred to good bulls.

Positively the best lot of registered and high grade heifers ever offered for sale in New York State. Buy now before the price advances.

J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Springdale Farms

Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. We are prepared to furnish carload lots of fresh cows, springers or cows due to freshen this fall, also two and three-year-old heifers. If you want large, heavy producing cows it will pay you to see our stock. You will find our prices right. **F. P. SAUNDERS & SON, Cortland, New York. Office 50 Clinton Ave. Telephone 116 or 1476M.**

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.

Henry Stevens and Son, - Lacona, N. Y.

A Grandson of the Famous $50,000 Bull

Here is a show bull, about three-quarters white, born Sept. 27, 1918. His sire is one of the best bred sons of the World's Greatest Sire,

KING SEGIS PONTIAC ALCARTRA

His dam has a junior three-year-old record of 22 lbs. butter and 482 lbs. milk. His ten nearest tested dams average 28 lbs. butter. Price $135. **G. G. BURLINGAME, Cazenovia, N. Y.**

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.

Susquehanna Farms, Hartwick Seminary, N. Y.

Offer Bull Calves sired by sons of *Pontiac Korndyke, Hengerveld DeKol, Pontiac Dutchland, or Admiral Walker Pietertje.*

Do you want a Pontiac in your herd?

PONTIAC STATE HOSPITAL, Pontiac, Mich.

Butter Making In Holland

Butter making is the chief business of the Holland Dairymen, the originators of the Holstein-Friesian breed of cattle. Upwards of forty million pounds of butter per year is exported from that little country, which is more per cow, and more per acre, than does any other country export.

If interested in **HOLSTEIN CATTLE** Send for our booklets—they contain much valuable information.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA, Box 101, Brattleboro, Vt.

Great Special Offer

1917 P-R-I-C-E-S

YES, the same prices as in 1917. Our Board of Directors has met and determined ***NOT to Raise the Price of the Brookfield to Farmers.*** Manufacturing costs have advanced tremendously, but as long as our steel supply lasts we have determined to ***stand by the former*** and ***not profiteer.*** But you must act now to take advantage of these 1917 prices. Write today—NOW—for the free catalog and full details of our 30 days' free trial offer.

The Brookfield

(*Latest Model*)

Thirty days' free trial on your own farm is your guarantee that the Brookfield Separator will meet any test. You run it yourself. You are the judge. We take all the risk. Now is your opportunity to get this separator for only $2.00 down and at ***1917 prices.*** Cut off the coupon NOW and send it for free illustrated catalog and full details.

Only $2.00 DOWN

A 350 to 900-Pound Separator

For this small payment down you can have a Brookfield Cream Separator of any size you wish, from 350 to 900-lbs. capacity, sent right to your own farm, on trial. If you decide to keep it you have a year to pay in small monthly payments. If you wish to return it, your deposit is refunded and the trial doesn't cost you a cent. We back this offer with our 37 years of square dealing with hundreds of thousands of men and women everywhere in America. Send now for free catalog and full details.

Free Trial!

Your chance to prove the superiority of the Brookfield by giving it a 30 days' free trial on your own farm won't cost you a penny if you are not perfectly satisfied. If you want to return the Brookfield we will refund your $2.00 and all freight charges. No offer could possibly be fairer. We are confident enough in the Brookfield separator to send it to you and let you judge for yourself. So, act now. Get the benefit of the ***1917 Prices.***

Beats Them All

I am certainly satisfied with my separator. It runs very easy, is a close skimmer and is handy. In competition with 208 separators in our district, our separator outskimmed all others and left the least amount of cream in the skim milk.

(Signed) J. W. MEYERS,
West Salem, Ill.

EASY Payments

We have made the time payments especially low so that you have a full year in which to pay—while you are learning of the marvelous qualities of the Brookfield—how it gives you greater cream poundage and thus saves the money you pay for it. We charge you nothing for credit. No interest is added. The Brookfield is sold in the exact way we carry on the other departments of our big business. There is no discount for cash. There is only one price for the Brookfield Separator—that is the *very* lowest.

Superior Points of the Brookfield

Skims all but $\frac{14}{1000}$ of 1% of Butter Fat

Average work of the Brookfield, proved by certified test at Dairy Department of Purdue University, Lafayette, Indiana.

***BUILT LOW*—Top of milk tank only 35¾ inches from floor—easy to fill. Crank shaft 33 inches from floor and in right position for easiest turning, no back-breaking work.**

***SPEED INDICATOR*—Brookfield Speedometer, patented, cannot be used by any other separator, insures correct speed at all times to get the maximum cream. Brookfield close skimming Sanitary Disc Bowl guaranteed to skim as close or closer than any other.**

***LIGHT RUNNING*—Self oiling ball bearings and patented, self oiling, neck bearing, used exclusively by Brookfield Separators, makes easy possible running machine.**

***DURABLE*—All gears made of finest steel. The Brookfield Separator will run for many years with no care except oiling.**

***EASY TO CLEAN*—Every part of bowl and discs easy to see and clean. No corners or crevices. All bowl parts, tank and milk and cream covers heavily double tinned and smoothly polished.**

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

A Dairy Story From Overseas

It has been our privilege to talk with a sturdy doughboy recently returned from the soil of France. He was a farmer's son, a dairyman's boy, and almost at the first call he left a prosperous business in the Middle [illegible] to do the sort of righteous [illegible] that Uncle Sam is sometimes [illegible] ask his lads.

[illegible] back now, back for good. [illegible]e bells have just rung in his [illegible]d he is very proud of the part [illegible]ons of farmers played in the [illegible]ty European conflict. They were [illegible]ve boys because they were hardy, strong boys. Health has something to do with it, you know. One can't play with fire if one's body is frail.

And those who went from the nation's farms possessed remarkable vitality. Their faces and arms were already bronzed. They knew the big outdoors. They could manage to sleep in trenches and mind it less. They were self-reliant, indomitable, accustomed to some of the essential hardships that have kinship with Mother Earth.

This boy had been interested in all dairy problems. He had a paying herd of his own. He loved cattle and understood their care. He had even gone to a farmers' college and mastered the scientific side of cattle breeding, milk culture, and wise business procedure.

And what he found abroad, in France, hurt him dreadfully. There was such desolation—such devastation! His heart went out to the tiny garden plots laid bare and bleeding by the enemy. It shocked him to see prone orchard trees, hacked to the quick, for he knew that it would require generations to bring back new trees and bearing orchards.

Yet he saw the working of a great, infinitely wise Power in it all. He was almost ready to believe that perhaps it was for the best. Through suffering, new ideals of life are born. It is interesting to get his viewpoint of these matters, for they are closely knit with dairying.

"For many months," said he, "I was back of the lines in France—poor, unhappy France. I was often billeted with peasant families. I grew to know them. They are quiet, unpretentious people, thrifty, and eternally hopeful. At no time did I hear complaint. French people look on the bright side.

"But it was the little farms that made me think. So many of them were irreparably ruined. I visited one place where shells had ripped into the very vitals of the home. The house was but a shadow, the vineyard was shorn, the small orchard level with the ground, and the once cultivated acreage a barren, soggy waste.

"A wisp of a mother and two wee children were in charge, brave, indomitable to the end. They knew, now, that the Germans would never come back that way again. The last cloud had passed. Reconstruction could begin. A cow—one of five—had been saved. There were a few hogs and some chickens. Soldiers, now and again, had helped to rebuild the home. Some green things were beginning to show in a meagre strip on a hillside. A flaming bed of poppies, like Poilu blood, consecrated and reborn, grew alongisde the shambles of a road. Shoots of fruit trees were struggling for life here and there.

"I used to tell this little French mother about my home and my herd and of the progress we had made from tiny beginnings. She never tired of hearing me recount the story of the gleaming white silos, and the concrete drinking basins for the cows, and the special manure pits, and the tractors that were doing such noble work for us.

"And I would tell her of the records we kept of the herd, of milk and butter profits, of immaculate dairy houses and highly specialized feeds.

"With her children snuggling close to her, she would make me tell, not once or twice, but many times, the story of a certain cottage under fine oaks and of our own electric light plant, and the suction sweeper and the spinning emery wheels that sharpened knives.

"The light that shone in her eyes, the light that I always saw in the eyes of the children, made me understand that soon now the French farms that were will spring from even richer soil and that a splendid progress will be inevitable. They will learn the new way. From the wreckage and the grief there will rise model dairy farms, revitalized and rehabilitated for the years that are to follow. It was once very pretty and very picturesque in these far lands of France, yet I could see that they lacked some divine touch which would have made them build.

"You will smile, but American boys, some of them, are staying in France. They love it so, they are so dearly loved. And these very boys, guided by comradeship and sympathy that side-by-side fighting has germinated, will make the fields blossom once more and efficiency pour forth its dividends. And, some day, I want to go back to France, and search for a certain little farm. I imagine I will find well bred cattle on the poppy slopes and cream separators and immaculate dairy houses and—who knows—perhaps a shimmering silo, bright in the Flanders' sunshine!"

"Slipping" not "Saving"

"I kept slipping back two feet every time I went ahead one." That's what the small boy gave as an excuse to his teacher for being late for school one winter day.

And that's just what is happening to the cow owner who is trying to get along without a cream separator or with an inferior or half-worn-out machine. Like the small boy he is "slipping". He thinks he is thrifty but for every dollar he saves by not buying a De Laval he loses two through not having one.

It ***isn't*** economy to do without labor saving and money saving and food saving machines. It ***isn't*** economy to feed 60 cent butter to the calves and hogs.

It ***is*** economy to buy and use only the best cream separator made—and that's the De Laval.

Viewed from every standpoint—clean skimming, ample capacity, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

It's real thrift and genuine economy to buy a De Laval Separator NOW

See a new De Laval machine for yourself. Try it to prove every claim made for it. If you don't know a De Laval agent, write direct to one of the addresses below

THE DE LAVAL SEPARATOR COMPANY

165 Broadway, New York **29 E. Madison St., Chicago.**

nteresting Dairy Notes from Idaho

J. F. BRUINS, IDAHO

dairymen of this section have a ew market with the opening of ondensery of the Carnation Com-

nsery Com- pany at Nampa this fall. This plant has recently been put in ation, and is said to be the sec- argest in the United States, with ximum daily capacity of about 00 lbs. of milk. It does not fol- however, that it is now running at extent. In fact, it is said that r the greatest difficulty the com- has met has been in securing its material and it probably is not ng more than a small fraction s requirements. Previous mar- have fully absorbed the dairy- s output and it appears as if the any would be obliged to develop fields. Its situation, however, is able, as railroads enter its lo- n from five directions and it is belt line electric road which runs d the Boise Valley and all of ributary country is potentially, st, excellent dairy country.

s development is being watched much interest by the farmer holders of the two co-operative anies in the Valley. These are ed principally in making e, the Boise company having five ies with a daily intake of about 0 lbs. of milk. So far the cheese ies have not been injured by ondensery and have kept prac- all their patrons. Farmers no feeling of unfriendliness for ondensery but they do have a recollection of the time when e corporations controlled their t and are disposed to hold fast ir present organization and the ty it has given them.

es for dairy products are high section at present. Butter has d at 72 cents and milk in Boise cents. The condensery is pay- .10 for 4% milk and the cheese y 75 cents for fat. Curiously h, with all the advantages that ection possesses for dairying, ds of butter are said to be d through here to supply North- Pacific coast points. Meanwhile e clamoring for cars to ship our potatoes, and hay to outside ts.

conditions for the season have lly favored the dairymen. farmers suffered from the hot, dry weather while the d Corn grain was filling but hay (alfalfa) and corn age are generally an excellent There has been no frost till the part of October for the last two in this section and corn has d and has proven one of the profitable crops.

average yield of silage corn for ction has been about 12 tons e, which is increased to 20 by cultural methods. The crop s but little work and no water gation until the grain is out of y. Silage is generally valued t half the price of hay, and at

CENE IN FRANKLIN COUNTY, THE OLDEST SETTLED DISTRICT OF IDAHO

$7 to $10 per ton forms a very profitable crop. It may be remarked that large numbers of range sheep and cattle are commonly wintered in the irrigated valleys and these supply a market for the silage as well as the hay.

We have an enemy to our corn crop here that other sections may find it profitable to guard against. Some years ago the state game department introduced the Chinese pheasant to this section with the idea of furnishing sport to the hunter and an object of beauty and diversion to the nature lover. The project was so successful that the country fairly swarms with them. To be more accurate, I suppose some 30 or 40 have made their home on my 40-acre farm during the past summer. Their habits are much like those of domestic fowl and what a flock of these will do to a field of young corn just coming up is calamitous. There is now an open season on them during the fall but many farmers take the law into their own hands and kill the pests whenever possible. In fact, by all means the best tool for raising corn in this section is a well loaded shotgun. The pheasants will not only pull up five times as much corn as an equal number of crows but they attack the ripening ears, particularly the choice early ripening ones you want for seed and also cause heavy loss in the grain fields. They flutter along just at the top of the ripening grain to thresh it out and then pick up a small part of what they have knocked down. The cock pheasants certainly are beautiful creatures but we no longer admire them. Farmers of other sections should watch out to resist strongly any attempt to plant these birds in their neighborhoods.

AN IDAHO DAIRY PLANT. NOTE INEXPENSIVE CONSTRUCTION OF BUILDINGS AND DERRICK FOR STACKING HAY

Hay is still selling at very moderate prices in this section, running from $10 to $20 per ton according to quality and location.

Hay is Plenty Corn silage in the field sold as low as $3.50 this fall. The fall rains have made an abundance of feed on the range and this will also tend to reduce the demand for hay. Also the presence of the alfalfa weevil in this section is threatening to or has placed quarantine against our alfalfa. In fact, the state of Oregon is said to be attempting to prevent the shipment of alfalfa there from southern to northern Idaho. The situation strongly encourages home consumption as well as production of feed.

SUNNYSIDE DAIRY OWNED BY JOHNSON BROS., IDAHO

Clover hay is being increasingly raised here as compared with alfalfa. The general practice is to secure one crop of hay and save the second cutting for seed. The first cutting generally makes about 2 tons of hay per acre and the second 3 to 7 bushels of seed, which this year is bringing 40c per pound. Clover weevil and aphis attacks the seed and in raising seed, dodder and buckhorn must be kept out of the fields, all of which make the crop a less attractive proposition than might at first appear. Curiously enough clover hay sells for fully as much as alfalfa in this section and often commands a premium. The straw from which seed has been threshed is valued at about half the price of the hay.

Our grain feed situation is the only fly in our ointment at present. Practically all we can get is mill feed with a very small proportion

Feeds Scarce of shorts in it and a mixed feed. The mill feed is almost straight bran and sells at $40 per ton. Probably for equal weight it is no better than straight alfalfa. The mixed feed sells at about $50 per ton and it is said to be composed of oats, wheat, corn, linseed meal, and beet pulp. As any one of these ingredients sells for $60 a ton or more one wonders what the answer to such a bargain can be. The feed is sold by a company which also manufactures oatmeal or rolled oats and the answer probably is that the "oats" in it consists of hulls, cheap, and filling no doubt, but of no particular value for milk production.

Farmers express considerable discontent with the situation with reference to mill feed. We have heard a great deal about "$2.20" wheat and consumers and the general public no doubt believe that the farmer gets that figure. In the course of grading, dockage, freight charges, etc., the farmer here got a little over $1.80. Also he has understood he might buy mill feed at 38% of the price of wheat. You might think, therefore, that 38 lbs. of wheat at the mill might be exchanged for 100 lbs. of wheat feed. But instead of that we get a devil and stump hippodrome of differentials and basic markets and terminal demurrage and a request for 66 lbs. of wheat instead of 38, all of which we dazedly try to explain to the cows over their short rations with no results whatever. We buy our bonds and devoutly curse the Kaiser, but at the same time we have a sneaking feeling that some one along the bread line is combining thrift with patriotism to an undue extent and a good many of us are surreptitiously lending aid and support to the Nonpartisan League in consequence.

The favorable corn crop and the price of hay is causing increased interest in silo construction. Some

Silos in Favor feeders claim that a ton of silage and a ton of hay have as much feed value as two tons of hay. At any rate the silo is increasingly popular and it may be noted that where one of them is built in a new community a regular rash of them soon breaks out over that neighborhood. We are leaning also toward more permanent methods of construction. The stave type is falling literally and from favor. In a dry climate their tendency to dry and shrink make them particularly susceptible to strong winds and bring more substantial types into favor. Many of the double walled wooden hoop type are seen among the new buildings, but the scarcity of labor has restricted the number of new concrete ones.

Cow testing association work has made progress here lately in both directions. A new association is being

Women Testers formed in the Boise Valley and is about ready to begin with 500 to 600 cows.

The greatest difficulty with this work here at present is the lack of testers. This has caused a temporary suspension of the work in the Buhl Association. It is proposed to meet the situation by employing women testers. Of course there is an obvious objection to that also. In a country where a schoolma'am with nothing but a pink ribbon to commend her to favor escapes domestic internment only a few months, what chance would there be of keeping employed a lady who knows every cow in the valley by its first name? We hope to employ a lady of mature age, preferably a widow, who has had experience with domesticity and is not likely to be lightly tempted again.

The favorable prices for dairy products and moderate cost of most feeds have brought about a good demand for milk cows

Cows in Demand here at present. Grade cows of the larger breeds sell at from $100 to $200 a head, generally with Jerseys considerably cheaper. One sale of grade Holsteins during the latter part of the summer brought an average of about

(Continued on page 714)

Secretary Houston Discusses the Agricultural Situation

AT the request of Secretary Houston some fifty editors of farm papers from every section of the United States met in Washington to confer with him concerning the present agricultural situation and wherein the work of the department could be made more valuable to the people. "The department," said Secretary Houston, "has long recognized that the farm papers are perhaps the most effective printed mediums for reaching the millions of people living in the rural districts. I know of nothing that the better agricultural papers of the Union have omitted to influence thinking along right lines and to further the purposes of the governments."

The secretary stated that the cosmic changes of the past few years had filled people with apprehension, but if the whole nation will maintain its customary poise and view its complex tasks in a calm spirit, much of our difficulty will disappear. In times like the present, hysteria naturally develops and because of its situation those at the nation's capitol are likely to get an impression that there is more of it than actually exists. However, the great masses of our population are busy at their own particular work and are not greatly excited.

During the first year of the war the American farmers planted 23 million more acres of the leading food crops than in 1916 and 32 million acres more than during the 5-year pre-war average. And this was done in spite of all difficulties, of labor disturbances, and confusion in every direction. The farmers have expanded their operations and have responded magnificently, not only for reasons of self interest but even more for patriotism.

Concerning the more immediate questions that are confronting farmers and what may be relied upon for the future, Mr. Houston said:

"It is difficult to forecast the situation a year hence. The foreign demand will be for a great variety of foods and feedstuffs, but especially for certain kinds of fats. It is, therefore, highly probable that prices for current supplies, for the harvests of this year, both because of large foreign needs and of continuing domestic demands, will remain reasonably high and remunerative to producers.

"When we come to consider the situation which will prevail a year from now and what should be done in respect to further production, particularly in planning planting operations for next spring, we encounter more difficulty in making a forecast. There are too many unknown factors. We must remember that European nations will omit nothing to produce those things with reference to which they can get a prompt response, that is, bread grains and feedstuffs. If conditions settle down and order is restored, all pains will be taken to systematize production and to have those countries become as fully self-sustaining as possible. Again, in all probability, restrictions on trade movement will gradually be removed and ocean as well as land transportation will return to normal in due course. They will doubtless improve in the near future. Foreign nations will more and more look to their former distant sources of supply.

Increased Domestic Demand Important

"We must consider this whole question in the light of the recent past and of the probable future developments. Many people think too much in terms of today. How many of you realize that this nation, in the fifteen years from 1900 to 1915, gained a population of 22,000,000, nearly three-fifths that of the Republic of France, a nation with producing and consuming power probably greater than that of any South American country. It is estimated, also, that since the European war broke out our population has further increased nearly 3,250,000, largely through natural growth. We have taken care of this population. Those who have wished to farm have found places. Doubtless we shall gain 15,000,000 or 20,000,000 in the next fifteen years, and these, too, we shall take care of. These, too, will benefit from agencies working for the betterment of rural life which, in point of scope, personnel, financial support, and effectiveness, excel those of any three nations.

Financial Preparedness

"It seems providential that the reserve system should have been inaugurated before the breaking out of the European war. This war involved financial burdens and strains such as no economist imagined any country could stand; and yet this nation has, by reason of the operations of the Federal Reserve Board and of the reserve banks, proceeded in orderly fashion with its finances. In no former period, either of war or of peace, were we able to weather any considerable financial storm. During the Revolutionary War our finances were chaotic. We promptly suspended specie payments at the beginning of the war of 1812, and also when our Civil War came on. During the period of expansion in the '30s, we suspended specie payments and did not resume them for a number of years. In 1873, by reason of the over-trading following the Civil War, we had a suspension within a suspension. Twenty years later we were in trouble again, and in 1907 we had difficulties of a special and peculiar nature. What would have been the course of things if we had been less fortunately situated in this war no human being can tell.

"Another task remaining in the field of finance is to provide a proper system of personal credit unions, especially for the benefit of individuals whose financial circumstances and scale of operations make it difficult for them to secure accommodations through ordinary channels. I am not oblivious to the fact that banks now make short term loans of a great aggregate value to farmers possessing commercial credit, but there are those who can not easily avail themselves of the facilities they offer. This would appear to be a matter primarily for state consideration and state action. Such course has been approved by many of the best economists and seems to have been that sanctioned by the Joint Committee of Congress. The Department has formulated a tentative model law for personal credit unions and is ready to place itself at the service of any state which is ready to undertake legislation in this field. A number of states already have adopted laws for personal credits. In most cases, however, the associations formed under them are composed of urban workers. The North Carolina law apparently has had more fruitful results in respect to rural associations. This is due, in no small measure, to the provision made for educational activity.

Land Settlement

"We are still, in a measure, pioneering the country and we shall be called upon to take care of many more millions of people in our own country. Of course, we cannot induce people to stay in the country districts or to take up farming unless we make rural life profitable, healthful, and attractive. Farmers can not produce merely for the love of it. They must consider their bank balance just as other business men do. In the long run, as many people will engage in farming as are necessary to produce the supplies needed by society and taken by society at a price which will justify the operation. Farming must pay and that is a prerequisite to its extension. The task of the organized agricultural agencies of all sorts is to improve rural life so that it will be profitable to the present farmers and attractive to those seeking new enterprises. They must omit nothing to improve processes, to promote economies, and therefore to relieve farmers of economic burdens in production, to control and eradicate animal and plant diseases and insect pests, and to better distribution and marketing.

"It is particularly vital that the process of acquiring ownership of farms be encouraged and hastened. This is now the process. Tenancy has its dark sides but it also has its bright sides. In no inconsiderable measure, it is a step towards ownership. It is a stage through which many of our owners have passed and are passing. It is a stage at which the young farmer, in many instances, begins his career. The statistics indicate that 76 per cent of farmers under 25 years of age and that only about 20 per cent of those over 55 are tenants.

Federal Feed and Fertilizer Laws

"Some complaints have reached the Department recently regarding c mercial feedstuffs. We have e studying the situation and it see me that it would be desirable to a a comprehensive federal feed l placed upon the statute books present, in order to secure for t public the benefits of the provisio the Federal Food and Drugs Act reference to animal feeds, it is n sary to rely on the appropriate l utes of the different states. Thes not uniform and there are a f states which have no laws tha be invoked. Under a federal framed along right lines, it shou possible for the government to ceed in a uniform manner and cure to consumers protection ag misbranded, adulterated, and w less feeds entering into inte commerce. Similar legislation reference to fertilizers passing interstate commerce probably be feasible and valuable.

Farm Economics and Farm Management

"I have been keenly interest my life in the economics of agr ture and I have therefore not emphasized in my mind the nec for developing a strong and eff Bureau of Markets, but also a ganization here for the satisfa study of the difficult problem farm economics and farm ma ment. I have by no means beer isfied with some of the work c present Office of Farm Manage I refer especially to the studies cost of farm crops. It is unnece for me to point out the difficult securing accurate statistics o cost of producing an agricu commodity. Corn, for instan produced by perhaps 6,000,000 ers over a continental area. It ficult enough to ascertain the c producing corn on a single where there are complex opera It is equally difficult to secure ages in a given area that are h guides. It is even more difficult a tenant is involved. Still, av are the best that we can get. requisite, however, is that they be based on actual and distinc dies on many individual farm that the facts shall be tabu carefully interpreted, and set o der the proper limitations. T not true with reference to the s recently much discussed. Comp impartial economists and st of the subject, after careful i gation, reported that the studie little more than expressions of ion based on impressions re from conversations with fa that the interpretations and tions were highly unsatisfactor that the conclusions as given misleading.

"I have the whole problem a in mind. I am calling into conf the best students of farm eco in the nation, including the he state farm management depart some of which have develope grams superior to parts of ou I shall hope, at the proper ti lay before Congress a carefull sidered series of projects for larged Office of Farm Manag I shall ask for sufficient author funds to secure the services best staff available and shall work in close co-operation wit equipped departments in state and universities. It is my ho the nation shall not again be without adequate and reliable production data as a basis thinking and acting. Of cours alize that farm management i more than mere studies of co involves land settlement, stu ownership and tenancy, of th tion of crops, of domestic and supplies in relation to domes foreign demand, and many things."

THE BIG SHED

This farmer believes in supporting the machinery manufacturer and dealer; he is not interested in his own profit. Proper care of this machinery would more than double its life, and it could be done at small expense.

A Well Managed Dairy Farm

R. I. GRADY, OHIO

THE BARNS ON MAPLE GROVE FARM, OHIO

I these days when many dairymen re selling their herds and going in- other work because of the high cost o feeds, the scarcity of labor, and the ratively low prices of milk and milk ducts, the experience of a man o is making his dairy pay is help- f. In the Maple Grove Dairy, Ohio, re is not a cow that is not return- it a profit. The manager, Mr. Carles Beelman, does not attribute h success to any one single factor, b considers it due to the methods o breeding, of feeding, and of caring f the herd. These methods are be- in carried out under ordinary prac- tical conditions and can, therefore, b easily employed by others.

The Maple Grove herd consists of a ut 100 head of registered Jerseys. T owner, Mrs. L. I. Buchanan, pur- ased a few registered Jerseys about t nty years ago and the present h d has been built up from them. The id constantly kept in mind was the im roving of their h d and the develop- m t of a particular str in of cattle. For c e years the herd did n make the progress sh it should have, be- ca e the management w left largely to hi d help who were n sufficiently inter- es d in the herd.

During the past few ye s the management h been on a different ba s. At the present ti the manager's sal- ar is a certain per e of the receipts of a farm and dairy. He d only has complete ha ge of the dairy but h of the farm of 212 ac s. He hires the la- o and does all the ha ng and selling. He sa vs that his income is irectly proportion- to the income of th dairy and for that rea on he does his best. Be g hired for a pe- d of five years, it is th his advantage to bu up the herd and im ove the strain because he re- ins a part of the proceeds from the s of cattle.

System of Farming

l other industries on Maple e Farm are subordinate to the y. About 125 acres are under vation, ordinarily all the rough- needed for the herd is raised on farm. This year's roughage crops st of 50 acres of corn, 5½ acres y beans, 3 acres of sorghum, 10 s of alfalfa, and about 35 acres of clover hay. In addition to these crops about 35 acres of wheat are raised which furnishes ample bedding for the herd.

Although the dairy receives first attention on this farm, the fertility of the soil is not being neglected. The barn is equipped with manure carriers and the manure is never allowed to accumulate in the stable, but is generally taken to the field each day. During those parts of the year when it is impracticable to spread the manure on the fields, it is stored in a covered shed where most of its fertilizing constituents can be preserved. Mr. Beelman believes he can obtain the best results by putting all the manure on the wheat and hay crops. Although some other method might be better, he is undoubtedly raising some good crops. Last year a 30-acre field of wheat averaged more than 32 bushels to the acre.

PART OF THE HERD AT MAPLE GROVE

THE RESIDENCE ON MAPLE GROVE FARM, OWNED BY MRS. L. I. BUCHANAN, OHIO

Labor

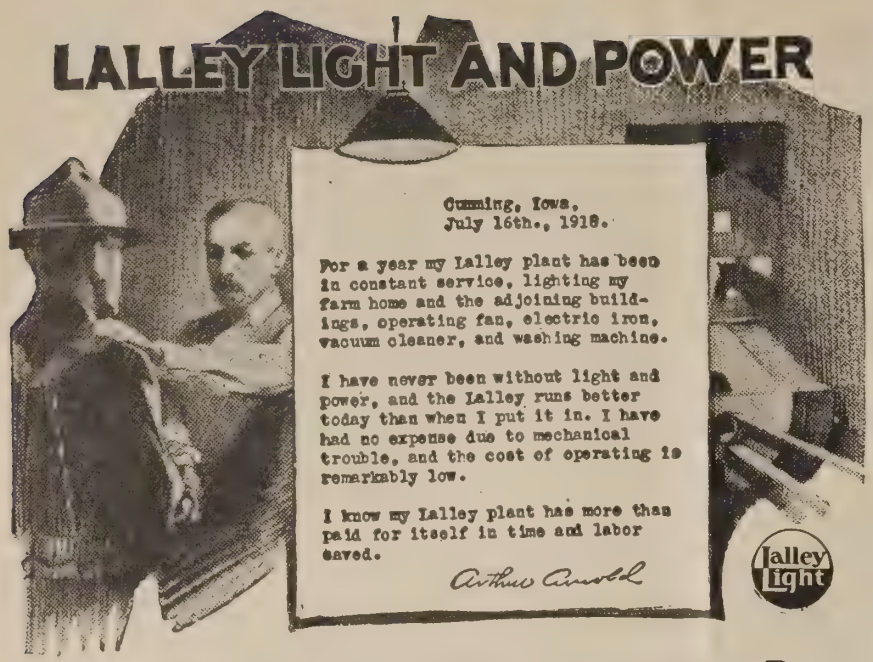
Much time and man labor are saved on this farm by the use of labor saving equipment. A 10—20 tractor furnishes much of the power for preparing the ground for seeding, harvesting crops, filling the silos, etc. A 4-unit milking machine does away with much of the drudgery connected with the dairy. With this machine the manager told me that he, with the assistance of a boy to weigh the milk, could milk 42 cows in one hour and 15 minutes. A dynamo furnishes power for operating the milking machine, for running the separator, for pumping water, and for electric lights. The barn is equipped with double rows of stanchions for 65 cows and 25 yearlings, has 6 box stalls for cows, and pens for about 30 calves.

With the help of machinery, Mr. Beelman and two other men are able to do all the work connected with the farm and dairy. Although there is plenty of hard work, there is no labor trouble on Maple Grove Farm. The men are willing to work hard because they are being treated fairly. The helpers begin work at 4:30 in the morning, take one hour off for breakfast from 6 until 7 o'clock, have another hour off from 12 until 1 o'clock, and then work until 6 in the evening. Each man is paid a good wage, is given a comfortable house in which to live, a garden for his own use, and milk for the table. Each man gets one day off on pay each month.

Breeding

It was the aim of the founder of this dairy by the careful selection of sires to build up a herd of high producing Jerseys. At the present time May's Signal Eminent 86652 and Fern's Sensational Eminent 136421 are at the head of the herd. Both of these bulls are grandsons of Eminent 69631, one on the dam's side and the other on the sire's. Eminent is the sire of 102 tested cows and of 33 bulls with tested daughters. He sold at auction for $10,000. Most of the calves and heifers now in the herd were sired by Fern's Sensational Eminent. If these heifers inherit the qualities of their sires much can be expected from them. Fern's Sensational Eminent was sired by Sensational Fern 75924. He was the sire of at least 20 cows in the Register of Merit and was sold at auction when eight months old for $10,200. For the three preceding generations Imp. Golden Fern's Lad was the sire of this bull.

Feeding Practices



The cows are fed as individuals according to their production. Each cow's milk record determines the amount of grain she will receive. Ordinarily 1 pound of grain is fed for each 3 or 3½ lbs. of milk. In addition to silage and either clover or alfalfa hay the herd receives a grain mixture consisting of bran, cottonseed meal, oil meal, and either oats or corn. By mixing his own feeds the manager finds that he not only has a better grade of feed but that his feed bill is much smaller also. Regularity in time and manner of feeding are matters of prime importance. The cows are fed grain and silage before they are milked. They are milked at the same hour, both morning and evening. After they are milked the cows are fed roughage, bedded, and watered.

Production

Every cow in this herd is making a profit. Daily milk records and extensive notes are kept of each cow. No cow is considered profitable unless she produces at least 5,000 pounds of milk in a year. Although the production of these cows is not unusually high, the encouraging thing about it is that the average production per cow is being constantly increased. The daughters almost invariably give more milk per year than their dams. Many of the cows are now producing more than 50 pounds of milk daily. It is expected to do some more official testing this year. During the official test which ended last year, the cows were given ordinary care and feeding and were milked only twice a day, and with the milking machine at that. All of the cows on the test made Class AA in the Register of Merit.

Mr. Beelman has several practices which he has adopted because they have proved helpful in his experience. A few years ago many of the cows in the herd had udder trouble during the winter. Mr. Beelman believed this was caused by standing on the cement floor all the time. To overcome this he puts a layer of planks on the cement in the fall and leaves it on until the cows are turned out to pasture in

(Continued on page 714)

Helping To Make Up The Farm's Man-Power

War is teaching thousands of farmers that Lalley-Light is a labor-saving necessity of utmost value; and that after the war the need for it will be even greater than now.

Men are leaving the farms to fight. Yet the world looks to American farmers to feed it while it battles; and must look to us for food long after peace has come again.

Inexhaustible Lalley electric light and power are taking the place of those who go—saving the work of farm hands—saving women's work—lengthening days that are all too short, and helping men do more.

Lalley-Light actually pays for itself in the first year or so—as shown by eight years of every-day farm experience.

Right now is the best time to see the nearest Lalley-Light dealer; or write us today for literature.

GEORGE F. COMINGS, WISCONSIN

"We must learn, we freemen, to meet as our fathers did, somehow, somewhere, for consultation. There must be discussion and debate in which all freely participate."—Woodrow Wilson.

IN recent years quite a number of people from America have visited Denmark in order to investigate social conditions. As a rule, they eulogize the remarkable progress made in that far away country. One speaks of it as "a little country filled with a contented, happy people." Another as "a farmer ruled country with everything done co-operatively." Still another as "a country where there is practically no illiteracy, very little poverty, the largest per capita savings bank deposits of any country in the world, where ninety per cent of the farms are owned by those working them, and where the most efficient, orderly, and economical system of marketing prevails."

Dr. Frederick C. Howe, Commissioner of Immigration at the port of New York, in his book "The High Cost of Living," says: "Denmark has few persons of great wealth and relatively little industrial life, but more has been done for education and intelligent co-operation than in almost any other country in the world. How was this brought about in the face of a niggardly nature, of a chilly, inhospitable climate, in a relatively poor state surrounded by greater powers?

"The movement began with education—a strange kind of education that has no exact counterpart in the world. Bishop Grundvig was the leader in this educational movement. He insisted that the schools of the country should be agricultural and the culture of the country should be the culture of the farmer. Today there are eighty-two of these people's high schools in Denmark, each one of which is independent in its administration and each of which is the center of politics, of discussion, of propaganda, of agricultural training. Text books are but little used. Classroom work of the ordinary kind is of secondary importance. The schools idealize country life and the nobility of manual toil. To attend one of these schools is the ambition of the peasant. He is taught the history of his country. He learns the songs of Denmark. He acquires a strong body. In addition, the curriculum includes farm accounting, natural science, drawing, surveying, bookkeeping, and agricultural economies of all kinds. Around about the school are experimental farms. The student learns about agriculture and the conduct of the thousands of co-operative societies which are to be found all over Denmark. He acquires a love for farming and the scientific appreciation of its possibilities and joys."

The Danish farmer is the most intelligent farmer in the world. He has a culture of his own, gained from the emphasis which has been put upon farming by the nation. As a result of education, a widely read press, and endless political organizations and discussions, the farmer has become the ruling class in the state. He dominates parliament. Members of the ministry are chosen almost exclusively from among the peasants, and the railroad, taxation, and social legislation are directed to the intelligent upbuilding of agriculture.

To halt the decay of agriculture taking place in the United States, to turn back the rapid sweep toward farm tenancy, a much better, more practical education for rural people is needed, and a thorough, all-inclusive organization of social forces in rural communities is demanded. Why has so little been done to unite the common forces? Why in an era of organization have the farmsteads remained unmoved, hardly touched by the great socializing forces?

We believe that in Wisconsin, where the land will permit, districts should be formed, without delay, equal in area to the ordinary township. (Six miles square.) At some central place where roads converge should be a bit of land, owned collectively, on which a fine school building and a residence building should be erected; the school building for community use, the residence as the home of the school superintendent—township advisor—and his corps of helpers. This school building should contain a fine auditorium, stage, etc., for by and by the movies, the finest educational force we have, will be a part of our educational system and be used to instruct, to please, to spiritualize instead of profit-mongering by appeals to the low, the sensual, the vulgar. In our school building, too, there should arrange for a marketing department.

Imagine, if you will, living in a consolidated school district and agreeing to co-operate for mutual good and advancement, are one hundred farmers keeping one breed of hens, developing them for large production. Suppose that on the average they keep eighty hens each and through the service and help of their township advisor produce an average of seven dozen marketable eggs per hen. This is only about one-half as many eggs as can be produced where good methods in breeding and feeding are followed, and only one-half of what may be expected in years to come as a result of intelligent, organized effort.

The eggs from our hundred farms are brought promptly to our school marketing department, where they are standardized and put upon the market as a certified product at an average of five cents per dozen better price than if marketed in the old-fashioned way. Our statement for the year may be as follows:

100 farms keeping 80 hens each, total 8,000 hens; 8,000 hens producing seven dozen eggs each, 56 dozen; 56,000 dozen eggs sold at a premium of 5c, $2,800.

Two thousand eight hundred dollars extra received for eggs is sufficient for the salary of a first class man who can live in that community and give his entire time to its upbuilding. Better than the two thousand eight hundred dollars saved, or even better than ten thousand dollars, is the fact that one hundred farmers are beginning to be Christians; for Christianity means going to market with good eggs instead of with blood-ring eggs. The most vociferous shouting "Amen! Glory to God!" in the prayer room meeting will not atone for bad eggs sold the following day in the market.

On our land, collectively owned, shall be carried on much experimental work in a small way. Each week during the summer vacation the children of the district shall meet at the school building, two or three afternoons from four to eight o'clock, for lessons in agriculture, under the direction of the township advisor.

n evenings each week, all the year
nd, plays, dances, and the movies
ll be used to develop the dramatic,
l artistic, the musical talents of the
mmunity.

Another feature we must plan for
a part of our community life cen-
ed in the school: On every farm, in
l near future, will be found several
es of gas engines, from the six
nder down to the smaller size used
run the separator or the pumping
k. Every winter a course of ten
ifteen lectures with practical dem-
tration work shall be carried on
ler expert guidance. In this de-
tment a larger saving is possible
100 farmers than is indicated in
marketing department for eggs.

n many localities across the road
m the school can be a community
ese factory, creamery, and laun-
, with one water and heating sys-
for all these industries, which
be used for the families in that
mmunity.

esides the social gatherings we
have games of basketball and
er recreational activities provided
in our community center, quite
uent Sunday afternoon programs
which the whole community shall
part, singing of national songs,
tations, lectures, explanations of
erimental efforts, discussions of
tical policies. Through these fre-
nt associations a real oneness of
pose for social justice and frater-
relation would result, the tides of
would flow, the common forces
ld be united, and a real communi-
would be created.

o spend four years during the

Brood Sow Rations

ARD'S DAIRYMAN:—Please ad-
me as to the best ration for
ng brood sows in good condition.
much should the ingredients be
sed prior to the weaning of the

lalia, Mo. L. W. W.

en we first came to the Iowa
n and took charge of the Ani-
Husbandry Experimental work
in 1910, one of the first things
d was to start some brood sow experiments with the object in mind of working out more efficient rations for the production of good, strong, healthy pigs at farrowing time; pigs that have big bones, good coats, and are of normal development.

We wanted the ration to be as cheap and economical as possible, and yet to be effective in the production of new-born pigs, and also effective in the carrying of the brood sows through the gestation period.

There are a number of good brood sow rations. We have found that out in our eight years of experimental work. But we have found that in using the ordinary grains as a basal feed that the brood sow ration during the period of pregnancy should be supplemented with either milk products or meat products or leguminous or clover products, if the best results are to be secured. We refer now to winter feeding. In the summer time, of course, good results can be secured by running on pastures other than legumes, such as young, green, tender bluegrass, luscious Dwarf Essex rape, and others. We particularly emphasize the rape because it has many of the characteristics of the legumes.

Some good rations, therefore, that we have worked out are about as follows: Corn enough to keep the sows in the condition required as regards fatness, plus one-fourth to one-half pound of meat meal tankage per head daily; or, instead of using the meat meal tankage, one can use from five to ten pounds of skimmilk or buttermilk or one-half to one pound of alfalfa hay, preferably of the leafy sorts. Usually the third cutting is best.

We tried using oats to balance up the corn ration, but as a lone supplement to corn it is unsatisfactory, as are wheat middlings. So is corn gluten feed; so is linseed oil meal. However, any of these good partial supplements, such as oats, wheat middlings, or linseed oil meal, can be fed in conjunction with milk, tankage, or alfalfa hay to balance up the corn ration. Barley will be balanced up like the corn, inasmuch as barley and corn are so nearly alike. The same is true of wheat, kafir, milo maize, and feterita, and other similar grains.

If one prefers not to supplement his grain ration in the winter time during part of the gestation period, he can perhaps get along all right, but it should be emphasized that during the last 60 days of pregnancy, or two months, before the pigs come, the brood sows should be fed particularly well, because during the last half of the pregnancy period practically 90% of the dry matter of the fetus is laid down.

After the sows farrow their pigs, some good rations for them would be as follows: Ordinary grain, such as corn, ground barley, ground kafir, ground milo maize, etc., in conjunction with skimmilk or buttermilk or meat meal tankage in dry lot or on pasture. If on pasture, such as alfalfa, red clover, rape, tender blue grass, much less milk and tankage will be required than where the pigs are allowed to have the run of the best pastures. In addition to this basal ration containing the ordinary grains, a combination of milk or meat products with wheat middlings, linseed oil meal, or ground oats can be used satisfactorily.

We like to self-feed our suckling sows with litters, and have had excellent success with these feeds self-fed: Shelled corn and meat meal tankage self-fed free-choice style in conjunction with five to ten pounds of skimmilk or buttermilk per sow with litter daily. Ground barley may be substituted for corn in the above ration, while other substitutes would be hominy feed, sorghum, kafir, milo maize, etc.

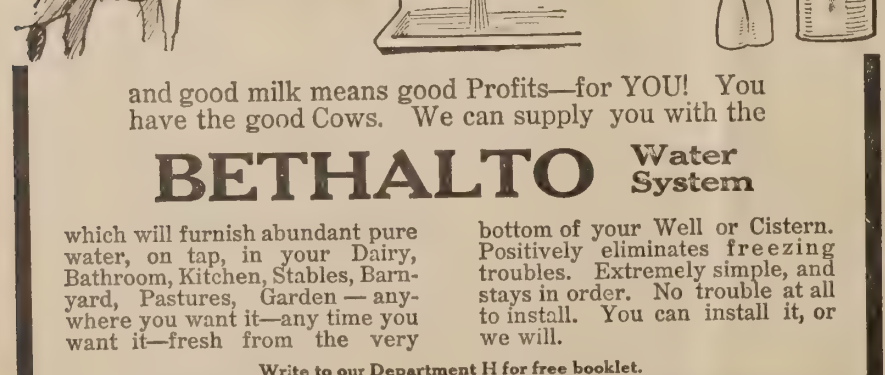
"BALL BAND"

TRADE Red Ball MARK

The Sensible Gift

YOU can make each member of your family happy this Christmas with a pair of "Ball-Band" Rubber Boots, Overshoes or Rubbers. They're strong, durable, well-fitting. They make welcome and sensible gifts.



Look for the Red Ball when you buy. It marks the boots, arctics and light-weight rubbers worn by ten million people and sold by sixty thousand dealers. You are assured of the lowest cost per day's wear when you buy "Ball-Band."

Ask your dealer.

Mishawaka Woolen Mfg. Company
313 Water Street Mishawaka, Ind.
"The House That Pays Millions for Quality"

If your dealer is not able to supply you promptly with the particular type of "Ball-Band" Boots or Arctics you desire, we can only ask you to be patient. Many of our boys in France are wearing "Ball-Band" Rubber Boots and Arctics. Meantime we are doing our utmost to supply, as quickly and as fully as possible, the wants of "Ball-Band" wearers at home.

GOOD + GOOD = GOOD

and good milk means good Profits—for YOU! You have the good Cows. We can supply you with the

BETHALTO Water System

which will furnish abundant pure water, on tap, in your Dairy, Bathroom, Kitchen, Stables, Barnyard, Pastures, Garden — anywhere you want it—any time you want it—fresh from the very bottom of your Well or Cistern. Positively eliminates freezing troubles. Extremely simple, and stays in order. No trouble at all to install. You can install it, or we will.

Write to our Department H for free booklet.

SOUTHERN AUTO & MACHINERY CO., 116 Robert Avenue, St. Louis, Mo.

An Engine You Can Trust

THAT'S the only kind you want, and that's what you get in the TYPE "W". Sizes from 1 to 15 H. P., and every one thoroughly reliable and dependable.

Simple, compact, perfectly balanced, the TYPE "W" runs as smoothly as an electric motor, and maintains even speed under varying loads. Other sizes up to 160 H. P. Stocks carried at principal points insure prompt shipment. Write for bulletin.

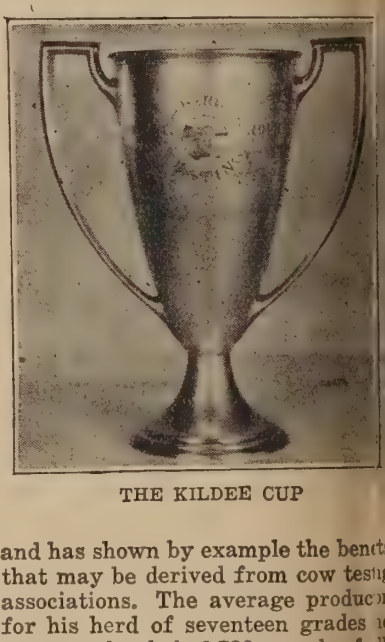
Association Notes

Eastern Bradford, Pennsylvania:—In October market milk was sold in this community for $3.51 per hundred. The average test was 3%, and for each point above, 4 cents were paid. The creamery paid 59 to 62 cents per pound fat, and the cheese factory $3.15 per cwt. Butter retailed for 60 cents per pound. Prices of feeds: Gluten, $2.75 to $2.90 per cwt.; oil meal, $2.70 to $3.15; buckwheat feed, $1.70 to $2.50; wheat bran, $1.95 to $2.10; hominy, $3.10; brewers grains, $3.25.

Canton, Pennsylvania:—Plans are going forward through the Bradford County Farm Bureau for the establishment of bull associations and tuberculosis-free accredited herds. Cow testing association work during the past five years in this county shows big results in better dairy profits. Milk sold for $3.73 per cwt. during October. The average test was 3% and 4 cents were paid for each point above test. Milk retailed for 12½ cents per quart and butter 60 cents per pound.

Sheboygan Falls, Wisconsin:—One member bought a yearling bull whose three nearest dams average 32.82 lbs. fat. He is out of a 27-lb. 3-year-old. The cheese factory paid $2.87 to $3.05 per cwt. for milk. Cheese sold at the Plymouth cheese board for 36 cents per pound. Gluten is $50 per ton; oil meal, $58; bran, $35.

Lawsville, Pennsylvania:—A Holstein bull association was started in Susquehanna County the past summer. In October market milk sold for $3.55 per hundred. The average test required was 3% and for each point above 4 cents were paid. The creamery paid 79½ cents per pound fat. Milk retailed for 13 cents per quart, butter 65 cents, and cheese 32 cents per pound. Gluten sold for $54 per ton; barley feed, $50; wheat bran, $45; corn meal, $60; cottonseed meal, $60; oil meal, $60; oats, $57.



Middlesex—Somerset, New Jersey:—In November market milk sold for $3.85 per cwt., the average test required being 3%. Four cents were paid for each point above. Milk retailed for 16 to 18 cents per quart, and butter 70 cents per pound. Feed prices: Corn, $50 to $60 per ton; oats, $50; bran, $40 to $50; linseed, $57 to $65; Big Six, $65; Unicorn, $67 to $70; silage, $10; alfalfa $35; clover, $25 to $30; timothy, $27 to $28; beets, $10.

The Kildee Cup

The trophy donated to the Iowa cow testing associations by Professor H. H. Kildee was won this year by Mr. Ernst Dengler, a veteran breeder of grade Guernseys in the Davenport Association.

The doner of the Silver Loving Cup intended that it should give an added impetus to the improving of the grade dairy herds by encouraging selection through cow testing association records. The rules of the competition in brief are that the whole herd shall be entered for yearly work and shall consist of at least eight cows of which more than 75% are pure-breds.

Mr. Dengler is a most worthy winner of the contest because he has for many years used pure-bred sires and kept careful records on his cows. He has always been a staunch supporter of the cow testing association work

THE KILDEE CUP

and has shown by example the benefit that may be derived from cow testing associations. The average production for his herd of seventeen grades and two pure-breds is 6,729 pounds of milk and 333.2 pounds of butterfat.

In 1915 the cup was won by C. Bechtelheimer of the Pioneer Association, his Guernseys averaging 8,126 lbs. milk containing 378.2 lbs. fat. In 1916 Ernst Dengler took the honors with his Guernseys averaging 8,056 lbs. milk containing 382.6 lbs. fat. In 1917 the cup went to T. Hansen of the Benson Association, his Holsteins averaging 11,387 lbs. milk containing 406.7 lbs. fat.

Iowa. C. L. BLACKBURN

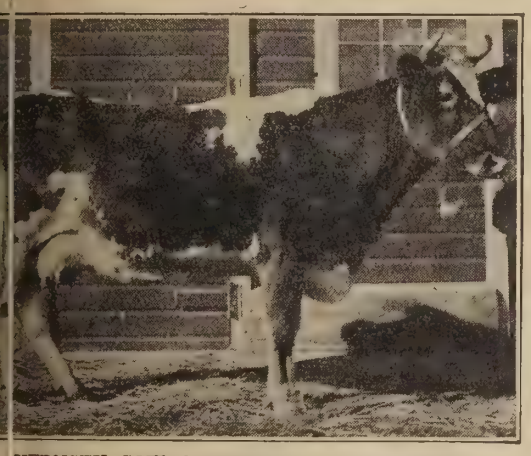
An Annual Report From Illi

The 2nd Lake County Cow Test Association completed its first year's work on November 1st, 1918. Twenty-four herds were tested during the year. With the exception of one or two, all the old members have signed for another year's work.

The improvement that has been made during the year in this association is surely a great credit to its members. Almost all of their unprofitable cattle have been disposed of and replaced by better and higher grade dairy cattle. Sixty-one head of pure-bred cows were purchased by the members during the year. Two-thirds of the members now own a few pure-bred cows.

By changing their methods of feeding and care for their dairy herds the increase in production after

cd month's work was enough evi- en to show the farmers that it ay to be a member of a cow testing sc ation.



C ing to the uncertain milk prices nd igh priced feed last spring, hun- e of well bred dairy cows from al County were shipped to the od Undoubtedly the cow testing si ation repaid double what it cost si n knowing what cows to sell and h to keep. At the present time e mand is so great for dairy cows a enormous prices are being paid r iem.

T re are only two members who ot have a silo. The records in e ast year have shown that silage d of the cheapest feeds a dairy- an can feed. It requires less labor d nsures against the slump in the ll flow, especially in the summer n the pastures are poor and dry.

O the 495 cows entered on test r g the year, 260 completed a c l of 10 months or over, and 135 r sold. Of this number very few n sold as milkers; nearly all the p fitable cows were sold for beef.

T highest fat producing cow for e year was a grade Guernsey n l by H. A. Eggers. She produced 2 pounds of milk and 554.88 u s of fat in 11 months. Her feed l was $143.06; milk value 0 1; profit over feed $143.06, or 1 for every dollar's worth of c ed during the year.

T average production of the 260

UERNSEY COW, FLOSSIE OF FOX VALLEY
Year's record: Milk, 11,082 lbs.; fat, 578.17 lbs.
WNED BY FRANKLIN LAND & TIMBER CO., WISCONSIN

completing the year's work was pounds of milk and 282.47 s of butterfat, with an average 3.78%. The value of the milk ed during the year was $208.98 w and the value of feed per as $112.83, which shows a re- f $96.15 over feed. An average .85 return for every dollar's of feed fed.

highest milk producing cow year was a pure-bred Holstein Velmberc Ansher 2nd, (4-year- owned by the Osborne Farm. oduced 14,005 pounds of 3.45% nd 480.37 pounds of butterfat; of product, $393.54; value of $217.07; return above feed, 7, or a return of $1.82 per $1.00 fed.

honor of having the highest roducing herd goes to Rouse rs. Thirty-six grade Holstein averaged for the year 8,200 of milk and 303.40 pounds of at, the average test being 3.7 t. Value of milk, $230.42; val- eed, $127.10; return over feed v, $103.32, or a return of $1.81 ry dollar's worth of feed fed. honor of having the highest oducing herd goes to Haw- Farms. Their Brown Swiss 49 head produced an average 3 pounds of milk, and 322.65 of butterfat, the test being cent. This herd has led the tion for fat production for the e consecutive months.

The most profitable herd in the association per $1 feed fed was a herd of grade Guernseys owned by H. A. Eggers, which shows a return of $121.31 per cow (10 cows) over feed expenses, or a return of $2.13 for every dollar's worth of feed fed.

Also Lloyd Ritzenthaler's herd of grade Holsteins shows a very profitable return. Eleven cows averaged 8,351 pounds of milk, and 312.32 pounds of butterfat for the year. Cost of feed per 100 pounds of milk for the year, $1.50; average return per $1 worth of feed fed was $1.91, or a return of $112.12 for each cow over feed expenses.

Elmer Gosswiller made an excellent showing with his herd of grade cattle. Twelve head show an average of 6,106 pounds of milk, 3.70% test, 225.92 pounds butterfat for the year. Average cost of feed per 100 pounds of milk for the year was $1.46 and a return of $1.81 is shown for every $1 worth of feed fed. This herd was fed mostly on home grown rations, with the addition of oil meal and bran with silage and clover hay as roughage during the winter. Grain was fed in limited quantities.

R. WILLIAMS, Tester.

Flossie of Fox Valley 37627

Flossie of Fox Valley 37627, owned by the Franklin Land and Timber Company, Wisconsin, has recently completed a record of 11,082 lbs. milk and 578.17 lbs. butterfat. She began her test when three years old, and has carried a calf 365 days of her testing period, thus qualifying for second place in Class EE. She started her test June 21, 1917, while owned by George W. Browne, Wisconsin, and was sold February 6, 1918, to the Franklin Land and Timber Company. Although not a phenomenal milker, she was a steady worker, giving fifty-three pounds of fat in her first full month and forty-two in her last.

Flossie of Fox Valley 37627 was sired by Wedding Bells of Waukesha 16844, an Advanced Register sire. Her dam is Yeksa Dimple of Fox Valley 35123.—American Guernsey Cattle Club.

Condenseries to Receive Full Sugar Quota

By a recent order of the Food Administration, condenseries may now receive their normal requirements of sugar and new condenseries may be opened. The need of condensed milk abroad for the nourishment of the liberated nations and the Allies is officially reported to be extremely pressing. Shortage of feed and fodder throughout Europe has resulted in serious curtailment in dairy production abroad. Europe is expected to require butter and condensed milk from America in large quantities over a period of years.

Farmers of the United States are asked to prepare for furnishing the great quantities of milk that will be required by condenseries now existing in this country and those to be built.

Jersey Cattle Notes

For week ending Nov. 22, 1918:

Number of animals registered: Bulls, 150; cows, 462; total, 612. Number of transfers recorded: bulls, 201; cows, 600; total, 801.

Buy Direct
From Dairy Supply Headquarters When You Need

Dairy Supplies or Equipment of Any Kind

We are manufacturers as well as dealers and we are therefore in a position to give the dairyman the very best value for his money considering the high quality of goods.

The following are some items selected from our big Dairy Catalog. They are pieces of equipment which every dairyman can use to advantage and are sold under The Creamery Package Mfg. Company's guarantee of quality.

New Elgin Pattern Milk Can, 10 Gal. Size	$6.15
Ideal Milking Pail, 10 Quart Size	$1.25
Chapman Changeable Strainer	$1.75
Jupiter Can Brush	.40
Pail Balancing Scale 30-lb Capacity	$2.85

Complete description of these and all other equipment in our catalog will be sent on request. Send your check for items you want and they will be shipped direct to you.

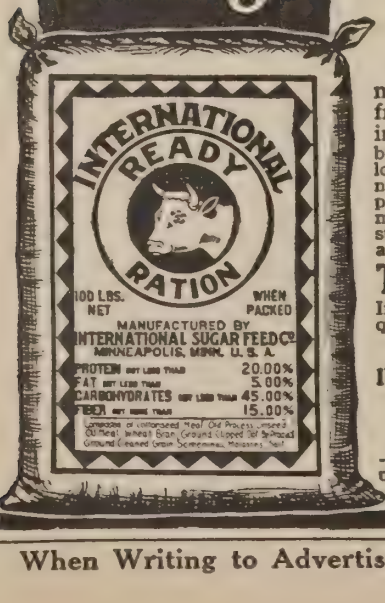
MOLINE UNIVERSAL DISC HARROW

FOR EITHER TRACTOR OR HORSE USE

You can use this disc harrow with either your tractor or horses and do fine work either way. It is built heavier and stronger than the usual horse-drawn disc harrow, but this construction does not detract from its usefulness when used with horses.

Gangs are held down under spring pressure and readily follow uneven ground and are easily adjusted while in the ground. Rigid frame takes up end thrust—bumpers do not ride—yet inner ends of the gangs angle close together. Each gang has three large dust proof bearings, with one-piece housings and wood bushings. Fixed scrapers keep the discs clean without attention from operation.



Built in 6, 7, 8, 9 and 10-ft. sizes, single or double cut, 18-in. discs with or without tongue truck. See your Moline Dealer about this disc harrow or write us. Address Dept. 18

MOLINE PLOW CO., MOLINE, ILL.

INTERNATIONAL READY RATION

You Could Not Buy It Till We Proved It Was Right

Turn Minutes of Loss Into Dollars of Gain

Every minute you spend mixing your own dairy feed is so much time wasted—time you could have spent more profitably—time that brings no return whatever—an absolute, dead loss. Modern dairymen are learning to save that time and to turn it into profit. They do it by feeding International Ready Ration, the complete, balanced feed.

Better Than Home-Mixed 20% Protein Feed

International Ready Ration contains a variety of ingredients and is extremely palatable. It has the right percentage of protein content, carbohydrates and fat. It is bulky and has a mild laxative effect.

Guaranteed To Produce More Milk

International Ready Ration is a proved milk producer. It will increase the flow from every cow and keep the entire herd in excellent condition. Our guarantee backs that statement. There is, therefore, no longer any reason for mixing your own feed—nothing to be gained by doing so. This highly productive ration is the result of years of experiment and experience, and comes to you a demonstrated success. Get the most out of your cows, and your time by feeding this ready-to-feed ration.

Try It Now Order a ton today from the nearest International dealer. If he is not conveniently near you, send your request to us. We'll give it prompt attention.

Manufactured only by

INTERNATIONAL SUGAR FEED CO.
Minneapolis, Minnesota
Mills at Minneapolis and Memphis

Also makers of International Special Dairy Feed—the original guaranteed ration for cows made to mix with home-grown grains or can be used alone.

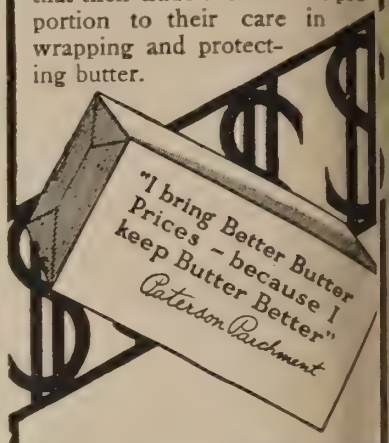
Maine Dairymen and Breeders' Meet

HOARD'S DAIRYMAN:—The annual meeting of the Maine State Dairy Association, the Maine Pomological Society, the State Seed Improvement Association, and the Maine Breeders' Association, together with the New England Fruit Show, was held in City Hall, Portland, Nov. 18 to 23, with a fine attendance and an excellent display of farm products, particularly of fruit.

The exhibits of the boys' and girls' agricultural clubs were especially attractive. Particularly so was the display of canned fruits and vegetables which filled one of the large rooms. Each county was represented and the arrangement of the fruit by counties enabled one to locate particular exhibits of special interest to the observer. The girls of Maine certainly know how to can fruit, not only so it is good to eat but handsome to look at.

Dr. A. O. Thomas, State Superintendent of Schools, gave a talk on Rural Life which was the principal address of the first evening. The speaker referred to the trend of the country towards the city due to the hard work of the farm, its isolation, and lack of school facilities. However, he had faith in the state of Maine and its agricultural possibilities, praised the high standard of its products, and pressed home to his hearers that the two most urgent needs of the rural community were better schools and better roads. The time was coming when the rural teacher would be paid a salary that would compensate her for the self-denial practiced in teaching in isolated sections and the farm would at no far distant day be brought nearer the city markets through the medium of quick transit over "truckable" roads.

The meeting of the Dairymen's Association opened Tuesday. At the business meeting the officers chosen were: L. C. Holstein, Cornish, president; J. A. Ness, Auburn, vice-president; H. M. Tucker, Yarmouth, secretary; F. S. Adams, Bondoinham, treasurer; L. E. McIntire, Waterford, trustee.



Dr. J. A. Kiernan, Chief of Tuberculosis Eradication Division of the U. S. Bureau of Animal Industry, spoke at the afternoon session. He stated that out of 40,000 hogs tested, ten per cent were found tuberculous and that last year the country lost 25 million dollars through this disease. The percentage of tuberculous cattle in some places in the West and in the East was as high as 75 per cent. Since 1910 Washington, D. C., had reduced its percentage of tuberculous cattle from 19 per cent to less than one. This had been accomplished by elimination, correct enforcement of sanitary conditions, isolation of infected stock, and purchasing new stock only from herds known to be healthy.

One thing Professor Kiernan objected to was allowing affected stock to be moved from one state to another. By this means the state with low percentage was menaced by an influx of infected stock. He would treat a section according to its percentage of tuberculous animals. If a low percentage, he would have those reacting killed and their owners indemnified; if medium percentage prevailed he would practice the method used in the District of Columbia; if as high as 75 per cent he would test out the clean cattle and herd them together; the others he would place under state supervision as tuberculous herds. With her herds carrying a low per cent of tuberculosis, Maine would have every state in the Union at her doors to purchase stock instead of those alone in her immediate neighborhood.

Professor P. A. Campbell, manag-

Increase Your Butter Profits

Money-making dairymen everywhere are looking to the *quality* and *cleanliness* of their butter. They know butter brings top market prices when it is clean, sweet and pure. They know that their trade increases in proportion to their care in wrapping and protecting butter.

Paterson Pioneer Parchment Paper

makes butter *taste* better, *keep* longer and *look* more appetizing. And don't forget that *looks* go a long way toward selling butter profitably. The best protection for butter and for good butter prices is Paterson Pioneer Parchment Paper. *Prove* it today.

r of Ayerdale Stock Farm of Ban-
r, spoke on "Upbuilding of the
iry Herd Through Breeding". Bet-
sires were advocated and the re-
tion in the herd of only cows that
re producers. To be an efficient
oducer he thought a cow should av-
ge a calf a year and give annually
least 6,000 pounds of milk.

At the evening meeting Arthur W.
lbert of Boston, a member of the
deral Milk Commission, spoke with
ference to the necessity causing a
cent increase in the price of milk
d the difficulty of fixing a price at
ce fair to all concerned. The price
not go much higher without driv-
g the public to the use of substi-
es. Mr. Gilbert urged a closer co-
eration among dairymen that they
y be able to handle the business to
e best advantage.

Richard Pattee of Boston, secretary
d manager of the N. E. M. P. A.,
s the last speaker. He told what
is organization had accomplished
the past year. Among its accom-
shments was the banding together
15,000 dairymen whose spokesman
was. It had kept the industry up
ring a period of depression and but
r it many herds would have been
crificed and their owners out of
siness. It had standardized the
siness, encouraged other branches
agriculture, promoted co-operative
rchasing, and, lastly, through its
gressive and progressive work it
d brought the northeast farmers
ring the past year $3,000,000 they
ver would have had without it.

The Breeders' Association met Fri-
y and elected the following: A. E.
dges, Fairfield Ctr., president; E.
. Morton, Orono, secretary; Arthur
. Ellis, Fairfield, treasurer. The
yrshire breeders chose J. B. Hod-
ns, Lewiston, president; J. F. Dean,
rtland, vice-president; J. A. Ness,
burn, secretary and treasurer. The
ecutive committee chosen were: J.
Dunn, N. Yarmouth; H. S. Day,
wiston; E. W. Files, Portland; A.
Rickser, Poland Springs.

H. W. Bailey, Superintendent of
mmit Farm, Davidson, spoke on
eeding Problems. Mr. Bailey em-
asized the importance of selection
ith a view of improving the herd—a
od sire and females for foundation
ock should be chosen with care.
od or ill to the stock results from
redity; while feeding, care, and
anagement have an effect on size
d constitution; good environment
d liberal feeding increase size and
pacity in a given family. As an aid
choosing a sire the official records
d individuality of his dam, gran-
m, and near dams should be exam-
ed. The cows used as foundation
r the herd should have strong con-
itution, large digestive capacity,
ell developed udder, large, full milk
ins, large muzzle, wide forehead,
d large eyes. The highest produc-
g animals are line bred but the
eaker warned that care should be
rcised as there is the same tend-
cy to make defects more marked as
ere is to emphasize good qualities.
changing sires he would use a bull
om the same paternal source but
om a different dam or a bull from a
lf sister to the first one's sire.

Successful Farmers

like Unicorn Dairy Ration because it brings out all the milk the cow can make. Just the feed to use with your home grown grain or alone.

During the cold, harsh, trying winter months every cow needs the best nourishing feed. She must maintain her bodily vigor as well as her bountiful flow of milk.

Every Unicorn feeder is a permanent Unicorn buyer.

Unicorn Dairy Ration is manufactured by

CHAPIN & CO., Dept. Z, CHICAGO

Buy Your Feed Early

Turn Water Into Milk

Get More Milk on Same Feed
Improve Cow Health
Prevent Contagious Diseases

MILK IS 87% WATER

That's what you can do with your dairy cows, besides saving a lot of time and labor in watering, by installing this most up-to-date system of stall watering—

Libbey Automatic Water Bowls

Milk is 87 per cent water and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15 to 20 per cent, which soon pays for the bowls.

Libbey Bowls are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circulars, prices, *Free Daily Milk and Feed Record.* If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

Montana Dairyman Killed

HOARD'S DAIRYMAN:—The state of Montana has lost one of her leading dairymen in the person of Ralph E. Logan of Stevensville who was killed at his home, October 22nd. From the meager reports at hand, it seems that he was engaged in tearing down a shed on his farm and when the building was about to fall, he noticed that the little daughter of one of his neighbors was directly in line of the falling timbers. In his effort to save the child, which he did, he was himself caught by the beams which broke his back. He was immediately taken to the hospital at Missoula, where, though provided with the best of medical attention, he died several days later.

Mr. Logan was one of the leading Jersey breeders and show men of Montana. He was vice-president of the Montana State Dairymen's Association, in which he was a very active and loyal supporter. He was a young man of thirty-six and had only started in his career as a stockman, yet had succeeded in building up a splendid herd of Jersey cows. It was Mr. Logan's hope to have the best herd in the West, and that he was well on the way toward the realization of his ideals is evident from the records of his herd.

Mr. Logan was a young man of high ideals and sterling character and an untiring co-worker for the upbuilding of the dairy industry of the state. His loss will be felt not only by his neighbors in the Bitterroot Valley but by every dairyman in the state.

G. F. MARTIN.

Montana College of Agriculture.

New York Butter Market

NEW YORK CITY, DEC. 3:—While quotations have continued to advance during the past week, the market is very quiet today. That condition is due to several causes, the principal one of which being increased receipts due to the arrival of butter which was held up in transit last week to allow shipments of poultry to reach New York in time for the Thanksgiving trade. In addition, and as has been anticipated, the consumer is beginning to let down to a considerable extent in his purchases which naturally causes a nervous condition to prevail. On top of all, receivers of butter are unwilling to take much risk on accumulated stores and are attempting to force some sales which always has a weakening effect. With increased receipts, more high quality butter has become available than during the past few weeks and dealers have become fairly well stocked with it. Under existing conditions they do not feel it wise to accumulate any quantities greater than actually necessary for them to keep their customers supplied because they feel that some day, as from a clear sky, the market is going to witness a great decline in values. While under conditions of war it was not felt that there would be any marked change in quotations on any single day, that feeling of security is greatly lessened with the discontinuance of actual warfare.

Last week Wednesday saw the quotations on extras and higher scoring butter advance a half cent. That was followed by advances of one cent on Friday and a half cent on Monday of this week. Today, however, because of factors cited above, the price was lowered a half cent, and practically all activity ceased. It is very noticeable that as soon as quotations begin to retreat buyers are noticeable because of their absence. We will undoubtedly witness further decreases in price within the next few days. These are the days when butter receivers feel the responsibilities of their positions. At the close today established quotations were as follows: Extras (92 score), 67½@68c; higher scoring than extras (93 score or above), 68½@69c; firsts (88 to 91 score), 61½@67c; and seconds (83 to 87 score), 57@61c. Unsalted butter continues in active demand with quotations on the usual basis as compared to those of salted butter. Naturally the decrease in price also affects its sale somewhat as buyers wait for still further decrease in prices when the market shows a weakened condition. W. B. LIVERANCE.

Prevailing Milk Prices

November milk prices paid New England producers of milk for direct consumption averaged $4.06 per hundred pounds for 3.5% milk, an increase of 27 cents over the October price, the range in price being from $3.86 to $4.53. These figures were secured by the Bureau of Markets of the U. S. Department of Agriculture from reports received from 35 different markets in those states. Average prices for milk of like test for other divisions are reported as follows: Middle Atlantic, $3.89; North Central, $3.58; South Atlantic, $4.30; South Central, $4.03; Mountain & Pacific, $3.58. The greatest range in prices, $3.73 to $5.65, was found in the South Atlantic States.

Prices per quart of "standard grade" milk received by producers and paid by consumers in several widely scattered sections of the country during the month of November, according to the report, are as shown in the following table:

Market	Producer receives per quart Cents	Consumer pays per quart Cents
San Francisco, Calif.	7.7	14.0
Denver, Colo.	7.5	12.0
Washington, D. C.	10.5	17.0
Jacksonville, Fla.	11.2	18.0
Chicago, Ill.	8.7	14.0
Indianapolis, Ind.	7.5	13.0
Des Moines, Ia.	7.8	15.0
Kansas City, Kans.	8.7	14.0
New Orleans, La.	9.5	16.0
Boston, Mass.	9.7	16.5
Detroit, Mich.	7.9	15.0
St. Paul, Minn.	8.1	13.0
St. Louis, Mo.	9.1	14.0
New York, N. Y.	9.1	16.0
Cleveland, Ohio	8.7	15.0
Eugene, Ore.	7.5	14.0
Pittsburg, Pa.	9.8	15.0
Philadelphia, Pa.	9.1	14.0
Memphis, Tenn.	8.5	16.0
El Paso, Tex.	9.9	20.0
Salt Lake City, Utah	7.1	12.5
Spokane, Wash.	7.9	15.0
Milwaukee, Wis.	8.7	13.0

The prices quoted for producers are for milk F. O. B. city and to get the actual price the various transportation costs must be deducted. In Chicago producers are paid 8.7 cents per quart F. O. B. city, whereas the producers actually receive 7.9 cents at their country shipping station; like variations occur for other cities according to the transportation costs. The prices given are based upon an average test of 3.5%, a differential of 4 to 5 cents per point being paid for higher tests. The consumer's price is for milk bottled in quarts and delivered. Comparison with October prices may be had by referring to a similar report appearing on page 555 of our issue for November 15th.

The following F. O. B. city prices are reported to have been agreed upon by producers and dealers for December: Los Angeles, $4.28 per hundred for 4% milk; Detroit, $3.69 per hundred for 3.5% milk; Atlanta, $5.65 per hundred flat price; Philadelphia, $4.71 per hundred for 4% milk. The New York price in the 150-mile zone is $4.06 per hundred for 3% milk.

Certified milk retails in Boston for 24 cents per quart, in New York for 22 cents, in Philadelphia for 27 cents, in Chicago for 21 cents, and in San Francisco for 20 cents. Dealers in these same cities sell buttermilk at 8 to 11 cents per quart, special fermented milk for 10 to 15 cents per quart, cottage cheese for 10 to 30 cents per pound (average 15 cents), 15 to 20% cream for 14 to 18 cents per half pint, and 22 to 30% cream for 15 to 27 cents per half pint.

Secretary Houston Wants Better Roads

The value of good roads as a means of making farm life more attractive and more profitable, as also the particular desirability at this time of the resumption and extension of their construction, was emphasized by Secretary Houston, of the U. S. Department of Agriculture, at his recent conference with the editors of farm journals. On this subject he spoke as follows:

"We must resume as quickly as possible, in full measure, the operations under the Federal Aid Road Act. You understand why they had to be contracted during the war. It is highly important that they be resumed. I need not emphasize before you the fact that good roads are prerequisite for better agriculture, for orderly distribution, and for a healthful and attractive country life.

"From unexpended balances of federal appropriations for the last few years, from state funds beyond what was necessary to meet the federal allotments, and from amounts available during the current fiscal year, shall have for expenditure during calendar year approximately $75,000,000. Next year, if all the bala should be expended during this and we would have to rely solel the funds accruing next year, we have from federal appropria about $20,000,000 and probably than this amount from state sou The states, in addition, will ex sums in excess of what they hav signed, or will assign, for federa road projects.

"It seems to me that we should even a further step—take this not only because of the importan good roads, but also because of th sirability of furnishing worthy jects on which unemployed labor ing the period of readjustment ma engaged. There will be many th suggested for which federal and funds will be sought. Some of will be unworthy. Clearly such p works as roads are worthy, ar would be in the public interes make available larger appropria from the Federal Treasury, to be separately or in conjunction state and local support.

Necessary Machinery Already E

"There need be no delay in the cution of such a program. The n has already provided the machi in the Department of Agriculture in the state highway commiss The Federal Aid Road Act was f ful of good legislation and each in the Union now has a central h way authority with power and f to meet the terms of the Federal The two agencies, in conjunction, been engaged in devising well co ered road systems and in making veys, plans, and specifications. task will be one of selection and roads should be designated for provement which are of the gre economic importance, with due re to such military and other neec are proper for consideration. The no necessity for any departure this scheme.

"The suggestions made have canvassed with the President, Secretary of War, and the Post ter General, and they are in a with the view that additional f should be made available to this partment and that they should b pended through existing machin

Rutabagas for Succulence

Kindly compound a ration following feeds: Bran, ground ley, oil meal, and if improving it terially could put in some gr oats. Have about 3 tons rutab early cut and best cured clover timothy mixed hay and some alf Cows are giving 20 to 30 lbs. testing 4 to 5% fat. Have no s this year.

Elcho, Wis. A.

We would suggest that each be fed daily about 30 to 35 lbs. of abagas, and we would advise fee 45 to 50 lbs. if the supply is suffi to last through the winter and grass comes. In connection with let each one have all the timothy clover hay she will consume wit waste.

A mixture consisting of 300 bran, 300 lbs. ground barley, 100 ground oats, and 100 lbs. oil meal supplement this roughage very Feed about 1 lb. for each 3 to 3½ of milk produced. Cows produ 5% milk require a little more g feed than those producing 4%.

Jersey Cattle Notes

Live Stock Sanitarians Meet

HE twenty-second annual meeting of the United States Live Stock nitary Association was held in Chi-go, December 2, 3, and 4. The rpose of this association is to dicate infectious diseases from live ck of the farm. The membership is de up largely of sanitary officers d veterinarians and a few live ck owners. The subject of destroy-g disease among our live stock is of al interest to the owners and more them should have a part in the rk of this association.

This year's meeting had a large tendance and was made up of repre-ntatives from all parts of the Unit-States and Canada.

In a gathering of this character ny of the subjects discussed are chnical and have little application r the owner of live stock. But out these discussions is coming a bet-r understanding of the handling of ntagious and infectious diseases of ve stock, and this is what concerns e practical stock man. Many of the en who belong to this association e engaged in experimental work and nsequently present much material r discussion and there follows nat-rally much difference in opinions. It only when investigations have been rried far enough to establish facts, ncerning the handling and treat-ent of a disease, that the entire embership agrees.

The work accomplished in establish-g tuberculosis-free accredited herds encouraging. It has taken many ars to come to a common under-anding of this disease and to provide uniform system of tuberculin test-g and handling tuberculous herds. ast year rules and regulations were lopted by the association for eradi-ting tuberculosis and establishing berculosis-free herds and they have en adopted in all the states. This as systematized the work of tuber-ulosis eradication and splendid prog-ss has been made during the last ar. This year the only modification at was made in the rules and regu-tions for tuberculosis-free accredit-l herds was the striking out of the word pure-bred. This was done for the purpose of permitting all grade herds as well as pure-breds to be accredited, if their owners so desired.

Contagious abortion, as in former years, was discussed but nothing new was offered as a treatment. No cure for this disease has been found, but isolation of aborters from the herd, proper sanitary conditions, that is, clean barns, stalls, etc., the use of disinfectants, and proper feeding have brought satisfactory control in many herds. There are those who hold that the feeding of mineral matter, such as bone meal, ground limestone, peat, and a salt of potassium, is of value. Milk is rich in mineral matter and it is reasoned that the high producing cow requires more mineral matter than her ration provides.

Much discussion was given to controlling the sale of tuberculin, hog cholera serum and virus. Permitting everybody to buy these products has in some instances produced fraud and spread disease. Tuberculin is used by unscrupulous veterinarians for hiding tuberculosis in animals suffering from the disease. The practice of dishonest men brings the tuberculin test into disrepute and makes the work of the honest veterinarian more uncertain and often valueless. Resolutions were passed requiring that the sale of tuberculin, hog cholera serum and virus be placed in control of state and government officials. The purpose being to prevent the incompetent and dishonest veterinarians from purchasing any of these products.

It was again brought out at this meeting that the best way for the live stock owners to keep their herds free from disease is through cleanliness. Keep the barns and yards free from manure; whitewash and disinfect the barns and stalls; and quarantine sick animals. Dirty hog wallows are conducive to many hog diseases.

The officers elected for the ensuing year are as follows: President, Geo. W. Dunphy, Lansing, Mich.; vice-presidents, John H. McNeil, C. B. Fitch, J. H. Anderson, O. H. Eliason, and A. W. Whitehurst; secretary-treasurer, S. H. Ward, St. Paul, Minn.

lational Dairy Council Meeting

The annual meeting of the Nation-Dairy Council was held in Chicago hursday, December 5th. About 75 ersons were present, including mem-ers and others interested in the de-elopment of the dairy industry. The mmittee of seven appointed by Mr. . D. Aitken, chairman of a dairy nference held in Chicago last May, ade its report. In substance, it rec-mmended that the Board of Direc-rs of the National Dairy Council e enlarged in order that a greater umber of representatives of nation-and state dairy organizations uld have a place on that Board. The commendation was accepted. A otion was then made and carried to mend the constitution of the Na-onal Dairy Council so that a larger oard of Directors could be provided.

In discussing the committee's re-ort, two views were held regarding ays of securing confidence and sup-ort of the National Dairy Council. ne group advocated that the en-rging of the Board of Directors so at national and state dairy associa-ons could have a representative on ie Board was the quickest and best ay of getting the Council into active ervice. These men held that this ethod would provide a representa-ve Board of Directors.

The other group believed in calling gether dairy representatives selected from the several states for the purpose of reorganizing the National Dairy Council and making it from its inception a representative organization of the dairy industry of the nation. Those who believed in the plan of calling together representatives from the several dairy states were in the minority, and the meeting proceeded to elect the Board of Directors by those present.

It was impossible under the system advocated by the first group to complete the Board of Directors on the day of the meeting, as it will be necessary for several associations to select their representatives upon the Board. The Minnesota and Iowa State Councils, having been advised of the meeting, were prepared to elect directors on the Board, but the Wisconsin Dairy Council, not having notification of the meeting, was not prepared to elect its member upon the Board of Directors. There was no uniform method for providing a Board of Directors. When the committee of seven was appointed, it was generally understood that it would provide plans for a larger educational campaign in behalf of dairy products and would suggest ways of bringing about a larger co-operation of the dairy interests. We have the same organization and the directors were selected in much the same manner as before by the Council, except that a few national and state organizations will be permitted to select their own directors on the Board.

It is our opinion that a splendid opportunity for advising the various branches of the dairy interests regarding the purpose and object of the National Dairy Council has been lost. It would have been to the benefit of the dairy industry to have called together representatives from the various dairy organizations of the several states that they might discuss the importance of an educational campaign in behalf of dairy products, and in this way come to a higher appreciation of the work of the National Dairy Council. Every state, where dairying is at all prominent, has dairymen's associations, state breeders' associations, and a few states have dairy councils, and there are various other state organizations. The colleges of agriculture, dairy and food commissions, secretaries of children's welfare associations, superintendents of public instruction of the several leading dairy states should be invited to attend a meeting of this character. There are, also, national organizations which would be only too glad to select men to represent them at a great national gathering.

It does not seem to us that the wisest and broadest course was followed for bringing about harmony and confidence in the work of the National Dairy Council. It was held by those who desired to elect directors of the Council with the few present that it would be next to impossible to bring about a representative meeting of the dairy interests. We can not agree with this view, for we do not know of any subject that is of deeper interest to all men who are concerned with dairying than the educational campaign to inform the consumers of this country regarding the food value and importance of dairy products. The few men who gathered at this annual meeting were not chosen representatives of the dairy industry of the states from which they came. Most of them came to the meeting of their own free will and proceeded to elect a board of directors to carry on the work of the Council. Good men were selected, but not in the way to make them a representative body of the dairy interests.

The National Dairy Council has a splendid work to do and the dairy industry needs the support and leadership of such an organization. We hope that it will be able to serve the dairy interests effectively and in time become a representative organization of the nation's dairy industry. This can be accomplished if every state will organize its forces and select a director and every national organization be given a representative on the Board.

The Wisconsin Short Course

Many intending farm students learned too late that the first term of the Short Course in Agriculture, at the University of Wisconsin, started November 14. Many others who wished to attend the course were prevented from doing so by army service or obligations, or the necessity of finishing the season's work on the farm. All of these young men, and others who desire education in agriculture, will be glad to learn that they may enter the second term of the Short Course, starting Dec. 30, and receive full credit toward graduation for all of the work they do in that term and the third term which runs from Feb. 3 to March 6.

All men who started the course last year should not miss this opportunity to finish it as quickly and completely as possible, for very busy and prosperous days are ahead of the farmer and the world looks to him for greater efforts than ever before in food production. The prospects are so bright for the farming business of the present and future that all farm boys and those from the city who are inclined toward farming, should earnestly endeavor to fit themselves in a scientific and practical way to take up this line of work and carry it on to the best advantage. The Short Course in Agriculture offers instruction in all of the subjects pertaining to farming and is fully equipped to make such instruction up-to-date and practical.

Catalogues giving full particulars regarding the course may be had on application to Assistant Dean J. B. Borden, Madison, Wis., who will also be glad to answer any special questions on the subject.

A Land Clearing Contest

HOARD'S DAIRYMAN:—Radisson and Exeland, Wisconsin, were hosts to a very distinguished lot of visitors on Tuesday, Nov. 19th, at the meetings that marked the close of the Second Southern Sawyer County Land Clearing Contest. The contest commenced October first and was for a period of six weeks, or until Nov. 15th. Fifty-three farms were registered in the contest. The territory covered was divided into two districts: The Couderay-Radisson district and the Meadowbrook-Exeland district. The rules of the contest made provision for all work done in bringing the brush covered acres into cultivation, whether cutting brush, picking up down material, blowing stumps, or breaking the land in preparation for next year's crop. A score card was used in the judging, and the judges scored the clearing on every farm.

First prize in the Meadowbrook-Exeland district was won by W. D. Compton, and he received $30 in cash, 1,000 ft. hemlock lumber, and 100 pounds of dynamite; 2nd prize, L. F. Hobbs, $25 in cash, 3 rolls of barb wire, and 75 pounds of dynamite; 3rd prize, J. E. Shinn, $20 in cash, 2 rolls of barb wire, and 50 pounds of dynamite; 4th prize, J. G. Hendrickson, $15 in cash, 1 roll of barb wire, and 5 bushels of pedigree seed oats; 5th prize, David Sinclair, $10 in cash and one Duroc-Jersey pig.

In the Couderay-Radisson district the same prizes were awarded, 1st, Simon Opsal; 2nd, Wicinty Smigilisk; 3rd, Wicinty Mosor; 4th, Blazus Kowalski; 5th, A. E. Thorhaug.

It is estimated that a total of 250 acres were cleared by the registrants in the contest during the six weeks. Some farms reported as high as 14 acres in the six weeks. With what was cleared last spring during the first contest and that done during the intervening period, approximately two thousand acres were cleared up in the two districts by all the farmers during the season of 1918. This means no small service to the nation at this time of keen food shortage. Southern Sawyer County has given her answer to the cry for more food.

EDITORIAL COMMENT

CONSIDER THIS A MOMENT

The Corn Products Co. tells the dairy farmer that his real grievance is against the low producing cow and not against the feed or the price of the feed. We wonder if that is not true, always true, with this provision—that you feed your good cow the right kind of feed and enough of it so she can make you a profit.

The assertion can be backed up by the facts. Even at the high prices of feed the good cow is making money for her owner. That is proved in all the states east and west. The great leak is the low producing cow. What a lot of farmers are blindly and persistently attached to the notion of keeping the poor cow! The wide prevalence of this attachment is seen in every community where a cow testing association is formed and in every community where they refuse to form one. Of all the delusions that ever affected the farmer his delusion for the poor, unprofitable cow is the strangest, most unaccountable, and the hardest to dispel.

Not long since a friend told us of the reply a Wisconsin farmer made to an agent of a cow testing association: "If I keep nothing but good cows I'd have nothing to feed my coarse fodder and silage to."

Can you beat that for sheer economic delusion? And there are such men, lots of them, keeping cows and swearing at the feed dealers.

A BETTER AGRICULTURE

The National Board of Farm Organizations is attempting to formulate a plan which will assist farmers to conduct their affairs upon a proper and businesslike basis. This organization desires to bring about co-operation between the farmers and to have them extend their influence in national, state, and local affairs. It is not only interested because it wants the farmers to be more active in their co-operation and in directing the affairs of the state, but because it desires agriculture to be put on a permanent basis. This organization put the following question to us: "What changes are necessary to bring about permanent agriculture?"

We replied to this question in substance as follows: We need a change of attitude upon the part of farmers, a new understanding, a larger realization of the agricultural situation by those engaged in this industry. We need to unfold before them the opportunities of agriculture and the necessity for co-operation. In some communities we must wait until the melting pot has established American citizens. We have had, in this country, little Russias, little Germanys, little Italys, and little Norways. On these islands attempts have been made to hold fast to their mother countries. They have not been willing to accept American ideals, American institutions, and American conceptions. They haven't put away their foreign souls to grow American souls. There is little hope of getting such communities to have a part in any great national movement for the betterment of agriculture until they have become true American citizens and until they understand the meaning of our government and until they realize the duty they owe to their community, state, and nation.

Every farmer must comprehend the power and necessity of co-operation,—that farming is a business and requires the application of business principles; and that intelligence, and not ignorance, is necessary to a successful rural life.

DAIRY COW SITUATION

During the past year or two would-be savers of the dairy industry have been going up and down the country trying to make dairy farmers believe that dairy cows were being sold to the butcher in such large numbers that the dairy situation was becoming serious. They tried to alarm everybody, to create discontent, and to bring about the idea that the men selling these dairy cows to the butcher were criminals and unless something could be done by the government to stop it, our country would be in serious straits. Bills were proposed to enact into laws that would force dairy farmers to raise all their calves. Nothing could be more ridiculous than to try to force farmers to raise dairy calves. The dairy farmer will raise calves and keep them when they are unprofitable but he is too sensible to raise them or keep them if they are not profitable.

Just prior to the war, in the year 1913, there were fewer cows than in 1912, but since that time the dairy cow population has increased continually. This situation illustrates the necessity of farmers doing some of their own thinking and being careful as to what source their information comes from when they are forming opinions in the conduct of their business. It is very easy for any man with a good voice, pleasing appearance, etc., to stand before an audience and make erroneous and misleading statements, to stir up feelings, and to lead men to think that things are going to everlasting smashup. Such men should be muzzled, for they not only depress the feelings of their audience but they bring about wrong attitudes. In some instances, they lead good men to think the world and all there is in it is bottom side up.

We should draw valuable lessons from the statements of the men who had all the dairy cattle marching to the slaughter house, because our government census of the cow population proves their statements were false. The same men, or others like them, would have the dairy farmers believe that the dairy industry was in a serious condition, when the facts in the matter are it is in better position for making money than it has ever been in its history. Let us take renewed courage and hope since the dairy cow is coming to her proper place.

CRITICISM

We believe in constructive criticism. We make progress through criticism if it is made in the right spirit and in the right way. Criticism without offering a constructive plan to correct evil and wrong practices is of little or no benefit. We do not hesitate to criticise our governmental institutions or individuals and when we do, we like to make constructive suggestions as to what may be done to adjust and right the things we are criticising.

Human beings are constantly making blunders and if we are wise we will profit by them. There is little value in referring to the blunders which have been made unless we gather valuable lessons from them. Simply stating that blunders have been made does not help to solve problems; it simply serves to agitate and bring about discontent, which is a splendid thing, but discontent must be directed properly or anarchy follows.

We are living in a time of sharp criticism. Our agitators are busy, and discontent is to be observed in nearly all walks of life. It is not a dangerous situation when people are discontented, providing it is the discontent which leads to progress and to better things. Discontent which leads to discouragement and to ignoring well defined principles of society and to disregarding right principles of business leads to destruction.

In the reconstruction period of agriculture, which is now before us, we must not lose sight of certain fundamental principles. We must remember that no human laws can be passed that will regulate the prices of farm products or any other commodity. To attempt such regulation would be as difficult as to overcome gravitation by law. We must bear in mind that supply and demand in every field regulate the prices unless combinations are made to interfere with the working of this law. It should be our concern as farmers to see that the law of supply and demand is not interfered with. This means that the farmers should unite and cooperate in directing their own affairs, and that they should have an interest in their state and national government. Forces which interfere with the law of supply and demand interfere with the progress of agriculture. Such forces should be criticised and plans offered for their elimination. There are those who believe laws can regulate all human endeavor, but the work of the Food Administration under war conditions indicates it is impossible to do this.

THE COUNTRY SCHOOL

The country school has been in a rut for many years. It has not made the advancement that it should or kept pace with its opportunities. It may be too soon to bring about a school that will serve the community both as a social and educational center, but it would seem that there are localities where schools of this character could be established. Such institutions as these would not only make country life more enjoyable, but would bring to it an inspiration that is so highly desirable in any industry. Elsewhere in this issue, we publish an article by Mr. George F. Comings regarding the rural school as a community center and what it may do to improve rural life.

Schools are nothing more or less than a co-operative enterprise, and on a whole our school systems have been successful, but there are tremendous opportunities for improving them and making the country schools of greater service to the fa- er and his children. The reason we do not have stitutions where a broader education may be tained, where a greater social relationship may enjoyed, is due to the lack of interest on the p of those living in the country. The farmers America have been slow in extending co-opera effort, and this may be attributed to several r sons. The farmers of Denmark, to whom Mr. C ings refers, were forced to form co-operative ganizations of various kinds in order to save th selves from starvation. They have accomplis much through co-operative effort.

We are not ready to agree with Mr. Comi that the Danish farmer is the most intellig farmer in the world. We can say that he co- erates better than any farmer in the world. American farmer, with all his difference to operation, to rural improvements, schools, so centers, produces more food per man than other farmer in the world. The farmers of Am ca have not been forced to see the necessity of operating. The splendid opportunities and the r soil have not made it necessary for them to w together like the farmers of Denmark.

Mr. Comings speaks of the decay of agricult taking place in the United States. In this, we not agree with him. We believe agriculture is m ing forward and upward, and that a better syst of farming is being practiced today than ever fore. Everywhere we can see opportunity for proving methods of farming, but gradually teachings of our leaders in agriculture are find their way to the farm. It is not uncommon now find farm houses with all the modern convenien barns with sanitary equipment, and other mach ery for facilitating work. A better class of stock can be found anywhere than was possi only a few years ago. Our fields are receiving l ter treatment and crops are being improved.

We commend the article of Mr. Comings beca it discusses matters which should be of vital int est to rural communities. It suggests what can done to make country life more profitable and joyable. It has a Christian purpose.

POOR COWS AND FALSE ECONOMY

The high prices of feeds have led some dairyn to practice false economy. We are informed t there is only half as much milk being received a certain cheese factory this fall as in former ye although the same number of cows are supply milk. The patrons of this cheese factory are t ing to make money by feeding their cows spari ly. We have never found a dairyman who made money by scant feeding. It may be cal lated on paper that to deny a cow a liberal rat will yield a larger profit than correct feeding, in practice the dairyman who feeds his herd erally is the one who is making money. That what men keep cows for.

The prices of dairy products are now wholly keeping with the prices of feeds. If there w money in dairying before the present advance prices of both feeds and dairy products, there su ly is money in dairying now. If the farmer fi he has not sufficient roughage or can not obtain adequate supply of feed for his entire herd, i better for him to dispose of a few of his poo cows and feed and care properly for those that retains. There was never a better time to disp of unprofitable cows than now and it is noth short of ridiculous to urge anyone to keep an profitable cow. The world is short of grain forage for cattle. The prices of cattle for beef high. This makes it advantageous for the n with unprofitable cows to dispose of them thereby save the forage so the good cows may h an adequate supply.

If the patrons of the cheese factory mentio above would dispose of one-half of their cows, the poorest, and feed the animals remaining so t they would produce twice as much milk as they when on a poor system of feeding, it would m a larger net profit and a saving of at least 25 more per cent of the feed of the patrons of t cheese factory.

It has been demonstrated beyond doubt tha dairyman who feeds his cows liberally and eli nates the unprofitable cow will make money. T has always been true and it always will be tr We have a record in our office of a herd of 28 c fed sparingly that did not produce as much milk a year as a herd of 8 cows fed liberally and the cows consumed more than twice as much feed. T man who owned the 28 cows received only enou milk to buy his scrimpy ration, while the man w the 8 cows, feeding liberally, made a good pro

e ave many such instances on record that were t red from farms where the cows have been sfi. In the face of such evidence and facts, no n man will keep a lot of unprofitable cows or e his herd sparingly.

Fall Pig Rations

\iat is the best and cheapest and quickest way epare some pigs a month old for the market? e lots of barley and corn. How much of this l have to give them each day? How would a eeder work? How much of each should I put ; I will have plenty of skimmilk after Christ- but at present I only have a couple of cows ng. Round Christmas I will have 18. Please e know the best way.

nyon, Minn. W. F. K.

st assuredly corn and barley are two of the basal feeds that it is possible to allow to pigs. are the ones that are producing a great deal e pork throughout the country, hence this in- r is well fixed on the basal side.

r fall pigs, we believe they should be given a liberal feed, inasmuch as they need to be kept throughout the winter and inasmuch as when are fed liberally they do much better than they are fed scanty rations. We believe that the fall pig should never go hungry the time he comes into this world until he out of it.

e self-feeder will work fine and in that case orn should be allowed shelled. We would not it, but the barley should be ground. It would good plan to allow both corn and barley in ate self-feeders, inasmuch as they would be umental in saving some of the tankage and necessary. We find that where pigs have ac- to both corn and barley that less of these high d superb feeds, such as milk and meat meal age, are needed.

r the present, therefore, the inquirer can de- upon tankage, allowing four feeders in the one containing shelled corn, another ground y, another meat meal tankage, and still an- salt.

give an idea as to some of our results along line, some experimental figures are in order. started out some fall pigs one year weighing s. and carried them to a weight of 250 lbs. or r.

t 1 received shelled corn self-fed, 60 per cent meal tankage self-fed, rock salt self-fed, all choice" style.

ter 123 days of feeding, these pigs weighed lbs., they having eaten per head daily 5.7 lbs. elled corn, .41 lb. of meat meal tankage—an age of 3.96 lbs. of grain for 100 lbs. live weight . They required for 100 lbs. of gain, 370 lbs. elled corn plus 27 lbs. of meat meal tankage, al of 397 lbs. of concentrated feeds. This is a good showing.

wever, it was improved upon by the addition ilk from the churn, which was fed at the rate ie pound per head daily, in addition to exactly ame ration as fed to Lot I.

ese pigs had somewhat better appetites for and ate 5.9 pounds instead of 5.7, but the ad- n of one pound of milk per head daily de- ed the tankage consumption from .41 to .36 d, or practically 12 per cent. The feed re- d for 100 lbs. of gain was 368 lbs. of shelled , which is a little less than where just straight and tankage were used, 22 lbs. meat meal age, which is some 5 lbs. less than where no was fed, plus 62 lbs. of buttermilk. On the dry er basis, it took a little less feed to produce lbs. of gain where the milk was added.

w the question arises if one pound of milk did how much better would 7½ lbs. per pig daily We tried that and with these results: The pigs 123 days were the heaviest of all, weighing lbs. The feed eaten daily was 5.5 lbs. of corn .21 lb. of meat meal tankage, in addition to the lbs. of buttermilk. The tankage here was de- ed practically 50 per cent or one-half as much eaten as where just straight corn and tankage allowed. In other words, the addition of 7½ f milk to the corn and tankage ration was in- nental in displacing practically .2 of a pound rn plus .2 of a pound of meat meal tankage, h was a good showing for the milk on the of average daily feed.

wever, the big showing comes in the feed re- d for 100 lbs. of gain and this showing is by neans the most practical. The feed required 00 lbs. of gain was 323 lbs. of corn plus 12 of meal tankage, plus 439 lbs. of buttermilk. ing this in the form of an equation, it is found contrasting this group of pigs with the pigs ving no milk at all, 439 lbs. of buttermilk, h, by the way, is the equal of skimmilk if not red too much, saved 47 lbs. of corn plus 15 lbs. of meat meal tankage; or, more simply stated, 100 lbs. of buttermilk saved in round numbers practically 11 lbs. of corn plus a little over 3 lbs. of meat meal tankage.

Assuming this corn to be worth 2½ cents a pound or $1.40 a bushel and the tankage 5 cents a pound or $100 a ton, the saving to be credited to 100 lbs. of buttermilk amounts to close to 45 cents. In addition, the pigs receiving buttermilk weighed more, showing that they did better; in other words, the test showed clearly that milk has some nutritional properties evidently that corn and tankage do not have, or at least that the addition of milk to this ration, even though fed in small quantities, was instrumental in increasing its efficiency.

When the 18 cows come fresh around Christmas time, therefore, and this man has plenty of skimmilk to feed to these fall pigs, they will go ahead and do splendidly and will let up on the meat meal tankage about in proportion to the milk given, although not exactly so.

In raising fall pigs some other things should be watched carefully in addition to the feed allowance, and it is well to state a few of the precautions which should be observed. These are:

1. See that the pigs are all eating well before they are weaned.
2. Wean the pigs after they have a good start.
3. Have a warm place for them always in the winter time where they may sleep and rest.
4. Keep their beds dry.
5. Keep their houses sunned and well-ventilated.
6. Feed the pigs in a nice, warm place. Do not make them go outside in the cold.
7. Keep them free from lice and worms. Use crude oil and santonin to do this.
8. See that the water is kept in fresh, flowing condition.

When the pigs are fed well and these things are done, they should get along splendidly.

It is well, however, to emphasize in closing that these fall pigs had best not be allowed too large a run. If they are kept in small yards about one-half acre that will be sufficient. If they run all over the farm, they are liable to venture out on days that they shouldn't and thus get a set-back.

Iowa Experiment Station. JOHN M. EVVARD.

Spreading of Canada Thistles by Seeds in Manure and Otherwise

Kindly advise as to the spreading of Canada thistles through seeds in the manure. The last tenant had a patch of a half acre in the small grain which were threshed into the grain and strawstack. If the manure is piled in the yard for a year some claim the heating process will destroy them. Again others claim thistles do not mature seed every year and especially in small grain will not ripen enough to grow.

Middleton, Wis. A. G. F.

Next to quack grass there is no doubt but that the Canada thistle is the most serious of noxious weed pests now in Wisconsin. For many years very little attempt was made for their eradication, and solid fields of Canada thistles for many miles in extent could be seen, especially in the lake shore counties. Since a definite system of rotation has been put on to nearly all farms and war waged on the Canada thistle otherwise, there seems to be a decided decrease in the size of patches and extent of the same. It is now up to every farmer to fight this weed pest in every way possible.

Canada thistles are spread to a greater extent upon the farm by the root stalk than by seeds. It is only occasionally that the Canada thistle will fully mature seed when it is being grown with the small cereals. By disturbing the Canada thistle through plowing in the fall and again by disking or cultivation in the spring, it interferes with it to such an extent that only an occasional plant will go to seed. However, some years seem more favorable than others and more Canada thistle seeds may be found at harvest with the small grains than in other years. Where Canada thistles are so harvested and are run through the threshing machine and get into the straw, these seeds are apt to be carried over in the bud quite persistently unless the manure goes through a rotting process for at least a year. The contents of the bud is such that it gives considerable protection to the seed, and consequently it requires considerable heating and decay before the seed would entirely lose its vitality. This is particularly true where considerable straw is left in the manure.

Rather than to leave the Canada thistles grow in the field it would be much better to cut those particular patches in the field just at the time they come into blossom. This would prevent all seeding. Farmers should watch their fields carefully and when Canada thistles appear should wage war upon them. Through constant cultivation during the dry spells throughout the year, Canada thistles can be entirely eradicated. Also fields of Canada thistles are eradicated by securing heavy stands of alfalfa upon the fields. Very seldom will Canada thistle stand more than two or three years of alfalfa, and many acres are now being taken out by the growing of this plant.

Wisconsin College of Agr. R. A. MOORE.

Congested Udder—Care of Cows at Calving Time

Why does a cow's udder cake at calving time? Is it good practice to feed a cow, particularly a heifer, with her first calf regularly up to calving? Does this have any bearing on the caked udder? Will cold water cause caked udder? I never have any great trouble getting rid of the cake in a few days, but it is a nuisance and takes lots of time that I need elsewhere. I have a heifer due to freshen December 5th. She has developed nicely and I want to keep her coming without any setbacks. I have been told that high priced cows are blanketed as soon as they freshen and are kept that way for twenty-four hours. Though I have no high priced ones, perhaps not exceeding $200 each, they are high testing, large producing grades, and getting 15 cents per quart for whole milk. I feel they are deserving of the best care and feed I can give them.

St. Joseph, Mich. H. R. B.

Our veterinarian makes the following suggestion: "It is best to stop all grain feed for six weeks before calving and during that time feed bran and oil meal to keep the bowels active and also allow outdoor exercise every day. Heavy feeding and lack of exercise induce congestion of the udder. The condition described is not 'caked' udder, that condition constitutes mammitis or garget."

It is well to feed a cow a liberal amount of succulence and feeds like bran just before and after calving. It is not a good practice to let a cow have any cold water for several days after she has given birth to a calf. The chill of the water should be removed. Further, be careful not to expose an animal at the time of calving to cold drafts. If necessary, keep the cow blanketed, but in a warm barn this is not necessary.

Ration for Bull

Please balance a ration for a Guernsey bull two years old weighing 1,400 lbs. Feeds are: ground oats, $70 per ton; barley, $70; dairy chop, $40; oil cake, $80. I have lots of mangels and lots of clover hay.

Which is best, box stall or yard to run in?

New Westminster, B. C. J. W. W.

Give the bull a liberal allowance of clover hay and perhaps from 5 to 10 and possibly 15 lbs. of mangels besides. We do not think it a very good practice to feed the herd bull very much succulence or feeds rich in carbohydrates. He must have a high protein ration if he is to be a sure breeder. We would suggest a mixture of grain consisting of 400 lbs. ground oats, 100 lbs. ground barley, and 100 lbs. oil meal. We would feed enough of this grain to keep him in good physical condition but not fat.

We think it is a good practice to provide a bull with some exercise either in an open yard or by the use of a treadmill. If the bull is kept in a barn, a box stall which permits him to see the other animals of the herd should be provided. We think barring his view of other cattle is not conducive to a good disposition. It may be stated that the yard should be so made that there is opportunity for him to observe the other cattle when they are outdoors.

Value of Skimmilk

I am using my skimmilk for raising pigs and in my accounts want to give proper credit for same to the cattle department. Will you kindly advise me what is considered a fair price to put upon skimmilk under present conditions?

Liberty, Mo. G. B. D.

Skimmilk is ordinarily figured to be worth from 50 to 85 per cent of the value of a bushel of corn. For feeding high grade calves it may be worth somewhat more than this, but the ordinary rule is that when fed to pigs at a rate not to exceed three pounds milk to one pound of grain, 100 pounds skimmilk is worth one-half bushel of corn or, in other words, 100 lbs. skimmilk will replace a half bushel of corn. In figuring the value of the skimmilk, the value of the corn on the farm should be used rather than the price prevailing in the grain centers.

Improved Methods Demand Improved Time

The old well has been yoked to the kitchen pump. Or else you have a towering water-tank, a reservoir all your own.

Picturesque as was the old well-sweep, you wouldn't think of going back to it. You're gradually adding every mechanical aid to farm-efficiency. But have you a Hamilton Watch? The jolts and jars of farm work do not disturb or impair its steady, reliable service. It's the most accurate, attractive, dependable watch our watch experts know how to make. Efficiency — that's its claim to your attention.

Hamilton Watch

"The Watch of Railroad Accuracy"

It is painstakingly constructed to do just one thing efficiently. It tells time — true time.

Write today for "The Timekeeper"

Hamilton prices: complete cased watches at $30 to $155. Hamilton movements to fit your present watch case, $16 ($18 in Canada) and up.

HAMILTON WATCH COMPANY
Dept. 64, Lancaster, Pennsylvania

OTTAWA ENGINE LOG SAW

STRICTLY A ONE-MAN OUTFIT

SIMPLE, strong, dependable. A fast fuel maker and hard work saver. Cuts any size logs into any lengths. Easy to move, by one man, from log to log, and from cut to cut on the log. Only five seconds to set from one cut to another. One man does the work of ten men. Easy to start and operate in any weather.

Saws 25 Cords a Day

Has two sets of spindles on combination axle—side spindles for straight ahead moving on the road; and end spindles for moving sidewise along the log from cut to cut. No stopping the engine and no lifting, prying, backing or twisting to set from cut to cut.

Direct gear to drive saw — no chains to tighten; no keys and no set screws. Automatic friction clutch protects saw allowing slippage under any pinch. 4-Cycle Frost Proof engine, Oscillator Magneto Ignition. When not sawing, demount saw equipment, by pulling one pin, and use engine for all kinds of other work.

Tree Cutting Equipment Full Information FREE

Write us, now, for full information on this log saw, and on our fast cutting equipment for sawing down trees. Low prices, now, on both outfits.

Low Priced — Fully Guaranteed. Prompt Shipment

New York Milk News

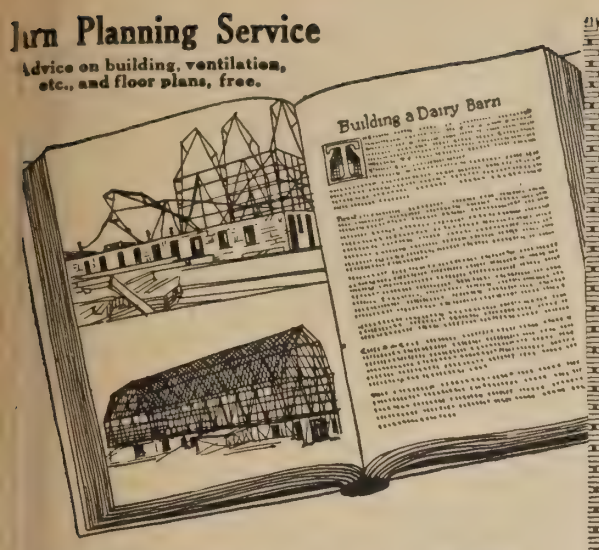
HOARD'S DAIRYMAN:—We have some strange conditions here and there in the milk business. A case has just come out where two concerns operated at one plant and on one platform. These two concerns paid different prices, one operated under League prices and the other paid less. So far as the farmers were concerned they hardly knew to whom they were selling. It was simply a dealer's trick to buy milk cheaper. Not that a dealer is necessarily up to tricks or that all care to resort to them. Every now and then some such plot is unearthed. In this case there was a remedy. The League officers went to the head office and argued that the condition was unwise and unfair. The company's officers said they would not change. The League said, "Very well then, you will get no milk at that plant nor at any other plant of yours." League members at the other plants said they would stand by those at the one plant noted. The concern held out until the last minute and then consented to capitulate. They saved a milk strike in all their territory, at all of their plants by so doing. Had it not been for strong organization the farmers could not have won their rights.

There were interesting incidents in this as in most cases. When the League was negotiating for all patrons of that concern to stand with the ones injured, they came across one local officer who said it was no concern of his about the men so far away. He was getting League prices and so were his neighbors and that was as far as it concerned them. Mr. Kershaw who was looking after the matter illustrated the point in this way: "Suppose there were four American divisions near each other, and suppose that the Germans attacked one division and could put it to route. After that was done they could attack another division and put it to flight and finally all would be subdued. Suppose, on the other hand, that the idle divisions came to the rescue of the one attacked and routed the enemy, then all would be saved." This appealed to the delinquent local man and he said that he was willing to go in with the rest and would see to it that all the others in his branch did the same. It is all a matter of co-operation as soon as one has a right case.

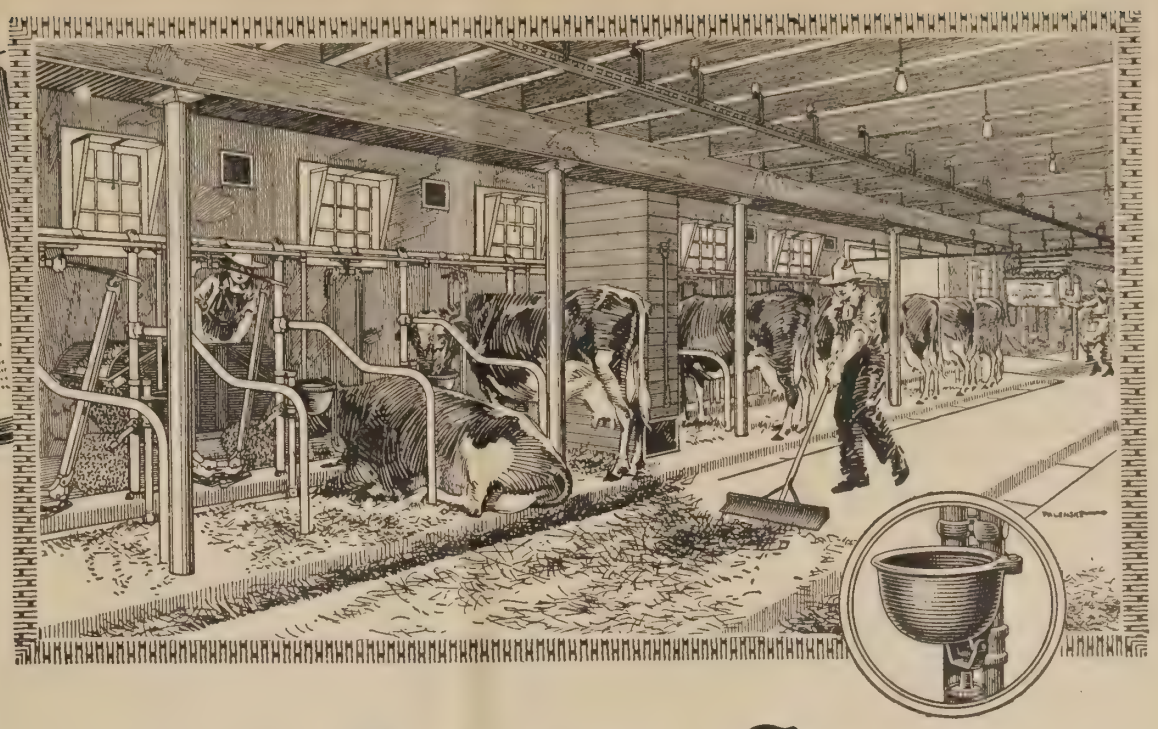
Organization among our dairy farmers seems to have come and if mistakes are kept at low order we can win every time. Fortunately, it seems to me, we are getting a national organization. It is true that the national affair is pretty large, but labor is so organized and dairymen can be if careful in doing it. The national organization has much to do, but stabilizing prices over the country is one of them. If Chicago or Boston lowers the price unduely it hurts all the others. There is a difference in the cost in various localities but these differences have been figured on and relative prices are now pretty well known. In making prices for any section it will be the policy to confer with other sections through the association of producers in nation and eliminate one troublesome feature.

We think that the Dairymen's League is the biggest and best of them all, but that may be a matter of opinion. It seems that our strength may be due as much to the financial system that we have as to anything else, probably more. The collection of one cent a hundred has been somewhat troublesome, partly due to the attitude of opposition to the League on the part of dealers. Even now some are not paying, but most are, and the cases that are delinquent are being looked after. It requires money to make an organization strong, for work has to be done and that must be paid for as well as expense accounts. In this the League has done wisely in providing from the first for substantial financing. We are all willing to contribute to the expenses but we need a more complete accounting system that will make collections and disbursements plain to those who pay the bills.

As I write on the 22nd of November the League in conference with the dealers and with Judge Lamb of the Food Administration as umpire have practically agreed on the price of December milk. It was the first meeting where there has been practically no scrambling for advantages and there has been of almost a perfect, friendly nature. We are told by those who know that had Judge Lamb instead of Dr. King acted for the past few months there would have been fairer treatment of dairymen and less loss of temper, both on the part of the League officers and of the Food Administration. That spat last month was bad. It put the Food Administration in a very bad light with dairymen just as have certain other acts of subordinates in the Food Administration aroused the ire of farmers elsewhere. I have yet to hear a well-informed man says things uncomplimentary of Mr. Hoover personally, except that he has been very unfortunate in the selection of some of his helpers.



About our December prices, I can only say that on this date they have not been officially announced but one day or more may get them. The point to-day in controversy is the allowance for the work of women and children. All the other labor items have been adjusted and feed costs also. There will be no particular delay over the one item, and the price of December milk will be around four dollars for three per cent test. (It was fixed at $4.06.) So far as I can determine dairymen will be satisfied with this.



Another feature in the milk situation has just developed. The mayor of New York City has directed the district attorney to make an investigation of milk dealers and producers and to jail any convicted of unjust profit making. The district attorney replied that producers are now exempt from such prosecution under a law passed at the last legislature. What the mayor and the city food administrator will try next no one knows. They will not inform themselves of the real cost of producing milk, nor will they accept proof. That has been tried without success.

This attitude on the part of the mayor and the administrator is very unfortunate in one way. It creates prejudice with the public, particularly against the farmer, and it will tend possibly pretty strongly, to reduce the consumption of milk. As dairymen if for the money we may have little cause for complaint in this, but taking the food value of milk into account the situation is bad. Milk should be used more rather than less. Mr. Dillon has the city press and the consumers with the farmers, but now the tendency is rather the other way. No one of our friends seems to have any way of overcoming this tendency. Add the requests of the Federal Administration to conserve dairy products, and we have much to overcome. We fear the end is not yet. Business interests have a desire to keep the cost of farm products down to the lowest and, if they can, they will cause some method of food control to be continued after the present administration goes out with the signing of peace. They can do this unless dairymen and other farmers get more strength through organization. There is more medicine to be taken or more fighting to be done.

New York. H. H. LYON.

Bee keeping may not seem a very important branch of agricultural work. Yet one New York State man sold $13,000 worth of honey this year

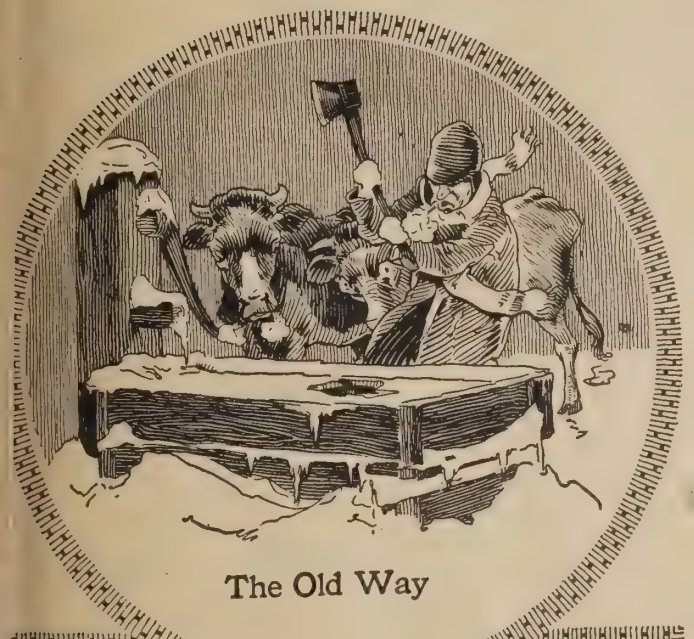
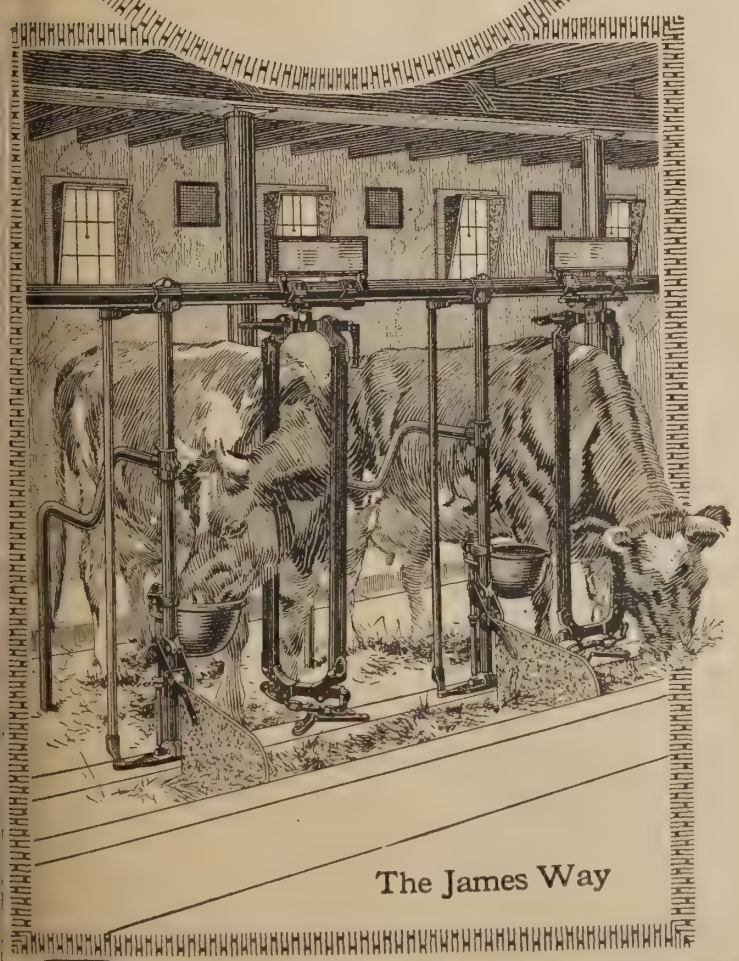
LESS-MILK THE OLD WAY



— James Cups — *Make More Milk Save Work and Fuel*

Four billion pounds more milk—$140,000,000 added profits—may be had ***this winter*** by farmers in the principal dairy states, simply by watering their cows properly.



A sensational statement, yet 'tis but simple fact proven by cow testing and other milk records in many herds.

Water—the simplest means of increasing milk yields, that element which is almost as free as air yet as important as high priced feed—is usually disregarded by dairymen.

Those dairymen who realize how greatly milk flow is increased by James Drinking Cups are reaping huge profits on their investment.

The Old Way

The James Way

Reports based on milk records of 27 herds, 739 cows, show an average increase per cow per day of 2 45-100 lbs., a saving each winter of $2.50 in labor and 56c of fuel. 2 45-100th lbs. per day is 490 lbs. for the season, which at $3.50 totals $17.15.

One herd reports increases of 5 to 10 lbs. per cow; three report 4-lb. increases; three say 3 lbs.; six 2 lbs.; three 1½ lbs.; one ¾ lb.; one $8.56 during the winter; one $5.00; one $10.00; one reports 3% increase; one 8%; two 10%; one 12½%; one 20%; and one says 33⅓% increase.

These reports are checked and confirmed by other reports and other investigations. Besides, there is practical unanimity of judgment that James Drinking Cups help prevent spread of disease and improve cow health.

Write today for booklet giving full details regarding James Cups and the James Free Trial Offer.

Other James inventions that increase milk yields, save labor and save feed are the Mor-Milk cow stalls, stanchions, mangers, ventilators; the James steel pens for cows, calves, bulls, sheep and hogs; manure, feed and milk can carriers; swinging cranes; bull staffs; floor scrapers; and supporting columns.

Barn Planning

Whether you intend to build, remodel or just make alterations or additions—either now or later on—the experience, special knowledge, advice and counsel of the James Barn Planning Department is at your service.

Free Book

The 320-page book "The James-way" tells all about these James inventions that save labor, increase milk yields, promote better cow health and prevent spread of disease, protect against dangerous bulls and make simpler the care of calves and sick cows.

SAMSON (Model M)
Complete with power take-off and automatic control
$650.00 f. o. b. Janesville, Wis.

SAMSON TRACTOR $650

THE above announcement, which appeared in a recent issue of this paper, resulted in receiving thousands of inquiries. Everyone of these we propose to answer in detail. The enormous amount of work involved in classifying these inquiries will, of necessity, delay our replies. On the opposite page, you will find a copy of our letter and the form, which we are asking you to fill out and return to us.

We also invite those who have not answered our first advertisement to fill in blank on opposite page and receive further information.

SAMSON TRACTOR COMPANY, Janesville, Wisconsin

SAMSON TRACTOR COMPANY
JANESVILLE, WISCONSIN

Dear Sir.

In response to your valued inquiry, we are enclosing a blank form which we will ask you to fill out and return promptly to us. Our object in obtaining this information is to determine whether or not the Samson (Model M) is suited to your needs and to what extent your particular locality lends itself to the use of tractors of the Wheel Type.

To be perfectly frank and candid with you, and to have you know what we are driving at, we beg to offer the following in explanation:

WE DON'T WANT you to buy a Two-Three Plow Tractor if it would be to your advantage to buy a Three-Four Plow Tractor. If your farm is better adapted by reason of acreage, crop rotation or soil conditions, to the Three-Four Plow type, we want you to have it, because it will be a more economical investment and will produce 25 per cent. better results with the same amount of labor.

Note: In this connection we wish to advise that we have designed and are testing out a Three-Four Plow Tractor which we expect to offer to the public within the next few months. This will be known as Samson (Model A) and the price will be in the neighborhood of $900.

WE DON'T WANT you to make an investment in Samson (Model M) Tractor if the Samson (Model M) actor is not the best type for your particular purpose.

WE DON'T WANT you to make an investment in Samson Tractor of any model unless by so doing can reduce expenses and make your burden lighter.

WE DON'T talk draw bar pull or attempt to confuse you with horsepower rating. Draw bar pull ittle value and means nothing to you if the tractor will not do your work.

WE DO WANT you in the Samson family—a satisfied and continuous customer for SAMSON SAVING AND MONEY SAVING DEVICES.

WE DO WANT you to investigate and (regardless of any high powered, land breaking tractors that buy or own) purchase a Samson (Model D) light, high frame, direct drive tractor, for which we are now ders. Price $450.

It will be to your interest to own the Samson (Model D)

BECAUSE this tractor will handle every horse drawn farm tool which you are now using;

BECAUSE we will be prepared to furnish the more important types of farm tools, made especially to amson (Model D), at just one-half the price which you will have to pay for these farm tools when you ice them;

BECAUSE the Samson (Model D), in connection with a ground-breaking tractor of any type and a ruck, will eliminate every horse on your farm.

METHOD OF ALLOTTING SAMSON (Model M) TRACTORS

e demand for Samson Tractors from all parts of the world is enormous. Our production for nths will not exceed 10,000 tractors. If applications and contracts were filled in h they are received, our entire production might be absorbed by s. For the purpose of obtaining a wide distribution, n opportunity of investigating the product and nance, we are allotting a certain number to each per Township distribution, locating the samples nt for the greatest number.

pplication, accompanied by your orde- or other- best consideration.

Very truly yours,

SAMSON TRACTOR CO.

SWEET SPRINGS GUERNSEYS

Herd Bull—Jacqueminot of Linda Vista.

Sire—Langwater May King.

Dam—Langwater Rosie. 72423 lbs. fat.

A number of bull calves six weeks to one year old, sired by this fine bull for sale at reasonable prices; also a few cows and heifers each year.

Herd Regularly Tested For Tuberculosis.

SWEET SPRINGS FARM

TROY, OHIO.

"Self Providers"

A statistical report published in the German press and dealing with the effect of war food on the human constitution shows briefly that farmers and their families lost no weight during the war, but that persons living in large cities were affected to a serious degree.

According to Bavarian doctors, the average person in cities lost about one-sixth his pre-war weight, but in small towns the loss has been only about one-twentieth.

"Self-providers," as farmers are called, lost no weight during the war and this observation applies to both men and women. Among city consumers, however, men lost about one-tenth their pre-war weight and women about one-fourteenth.—U. S. FOOD ADMINISTRATION.

Fits

We have a litter of pigs 8 weeks old. One week ago one of them would not come to eat with the others and I took it away, and put it in a separate pen. He tried to bite on a wooden partition, scratch with one or both of his front legs, fall backwards, walk backwards, dance around in a circle as if drunk, fall down, tremble like a leaf, stretch all four legs out as if dying. Then he would get up again, sit on his hind legs, hold his head up, have his mouth wide open so that water runs out, and act as if choking, then he would go around as if in a normal condition but would not eat. Then a little while after the same thing would happen again.

Connecticut. L. A. I.

Indigestion is causing the fits and the feed is to blame. Give each pig a dose of castor oil in milk; then feed milk containing a little flaxseed meal and an ounce of limewater per pint. Gradually add wheat middlings and ground barley or rye to the milk as the pigs improve. Allow free range and supply alfalfa hay as an additional feed.

Cows' Resting Period

I have some Jersey heifers that were bred quite young. They will be milking 10 and 11 months when freshening again. Which would give the best results, to give them three months' or six weeks' rest? And if you give them three months' rest would they have a tendency to go dry too soon next time?

Phoenix, Arizona. R. R. S.

As a rule it is not good policy to allow a cow to go dry much over six weeks if it can be helped. Too long a period of rest often makes it difficult to get the cow in calf, while too short a rest lessens likelihood of a full flow of milk. Six to nine weeks' dry period should suffice in the cases mentioned, provided the cows are well fed.

Loss of Horns

Through an accident a Jersey heifer of mine lost the shell off her horn. I immediately cleansed and sterilized everything thoroughly, put the shell snugly on again, and fastened it to the core with small sterilized screws. What are the prospects of this shell growing permanently fast again? If I should lose it and remove also the shell from the other horn, would these cores become sufficiently hard and smooth to be dressed up into a nice matched pair of shapely horns, as they were before?

Chicago, Ill. H. J. R.

What happens when a human nail is knocked off? It grows again from the pododerm and, in the same way, a new horn forms from the sensitive core or matrix. Injury, however, may cause the matrix to secrete an abnormal or deformed horn. Examination, no doubt, will show that the sloughed horn is simply acting as a shield for the new horn forming upon the vascular core.

DAIRY MARKETS

CHICAGO, Ill., Dec. 5—Butter—Creamery, extras, 67c; standards, 62¼@62½c; dairy, firsts, 59@66c; seconds, 54@57c.

Australian Dairy News

RD'S DAIRYMAN:—The wheat ry is down in the dumps. The rs have been told that there is g very definite about the British ment buying the wheat surplus oming season, estimated at two i tons. Two causes contribute to sappointment—the bumper crop nerica and Canada, and the ge of shipping. If there was any e space for it, it would not so much, but every energy is provide shelter for a lot of the illion tons bought and paid for British government. A number farmers foresaw a possibility a glut and they turned stock heir cultivation paddocks last The feeling is hopeful, however, the time the crop is ripe that r circumstances in the fighting ill release enough shipping to the outlook.

t is the most talked-of land t in Australia, inextricably up with dairying. Price fixation he ruling passion just now, the government yielded to popumand and declared a meat e, despite the difficulties which the industry and do not apply products as wheat and butter. ck owners at once protested at es as spelling great losses to ho had bought during the year open market. They emphasized ttitude by declining to market tock and so fish and rabbits the diet of the big centers. At the government backed down g rates on export parity.

butter pool inaugurated last to be magnified to a complete of the whole of the Australian , estimated to be worth fully 00. The imperial purchase ill be on the basis of recent A board, consisting of three and three federal governominees, will take control, in every issue. Being really a o-operative matter no factory ng with standards will get any ge. Grading will be in official The system has already been ation and has proved to be a on to the industry, for each which trucks in low grade nust shoulder the risk, as the are no respecters of persons tories. Dairy produce lends asily to co-operative bargainl the deeper the control, the ientific must the base of the ecome.

McGarvie Smith, the discoverer anthrax vaccine, is dead at an d age. He left his patent his laboratory, and an endowf £10,000, to the people of ia, with the New South Wales ent as trustees. The data of ratory belong to the work of seases. A peculiar feature of is as to who is to be made the laboratory secrets. Probcourts will be invited to settle es.

Friesians are surely climbing e ladder of popularity, though ny years they were here a d dairy entity. The lift is ene to merit, capped just now by ndid performance of the New cow, Westmere Princess Pielonging to the Friesian stud of n MacDonald of Westmere. Her ield in 365 days was 2420 galting 3.88 fat, yielding 940 lbs. inning on her fourth calf, she gain 36 days after completing . Though typically Friesian, esses all the milking characterf the Jersey. Her performance entitles her to the championship of New Zealand, all breeds. She comes of American blood and is from Netherland Princess by Paul Pietertje.

Since the war the price of rennet has run up fabulously as the whole of Australian dairying depended upon outside sources. This scarcity whipped up investigation and now Dr. A. E. Finckh, of Sydney, is reporting success with his formula, under the aegis of the Agricultural Department. The trials have thoroughly tested the specific's coagulating powers as against standard rennets and on that last occasion the report stated that "the samples used at the rate of 3½ ounces per 100 gallons gave results as good as other rennets used at the rate of 4 ounces per 100 gallons." The cheese so treated has kept as well as any other.

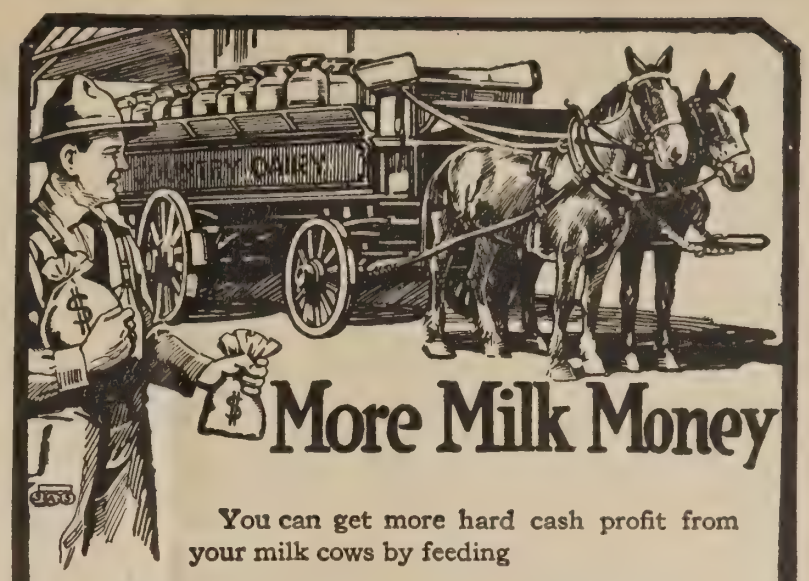
Australia. J. S. DUNNET.

(Editor's note: The above was, of course, written prior to the signing of the armistice terms, which will materially affect the Australian market.)

Short Course for Herdsmen

Young men with a leaning toward the pure-bred live stock industry will find opportunity to make special preparation for that field of work in the Herdsmen's Short Course at Iowa State College, Ames, beginning January 2, next, and running for ten weeks.

This will be the second course of the kind offered at Ames. The first, offered a year ago, won the approval of live stock men the country over. "We have had letters from many different states urging us to offer the course again," said Professor H. H. Kildee, head of the animal husbandry department of the college. "They are anxious to send young men for the training we offer."



The course is thoroughly practical and meets the requirements of the best breeding establishments. A young man will save time in setting aside ten weeks for the course instead of depending solely on his experience with a herd for his training. The instruction combines schooling in herd and flock management and related subjects, with practical work with the fine live stock of the college. It will be given by the members of the animal husbandry faculty with the assistance of the college herdsmen, horsemen, and shepherds, and of many prominent live stock men who will give special talks and demonstrations. R. V. Ogilvie, president of the American Clydesdale Association; Ed. Davis of Iowa City; Geo. Potts of the Bell Bros.' horse establishment at Wooster, Ohio; Professor Frank Kleinheinz of the University of Wisconsin; Axel Hanson, herdsman for J. B. Irwin of Minneapolis; E. X. Russell, swine expert of the Bureau of Animal Industry; W. A. Barr, swine breeder of Ames; John Lethan, special representative for the American Hereford; and Ray Arnold of Hargrove & Arnold, Norwalk, Ia., will be among these special speakers.

To Iowa young men tuition is free. A moderate charge is made to young men from other states. Write to H. H. Kildee, Ames, Ia., for further information.

The Man Behind

They sing about the glories of the man behind the gun,
There's something sort o' thrillin' in the wonders he has done;
And it makes you want to holler when the boys go marchin' by;
And the books are full of stories of the flag that's wavin' high.
But when the shoutin's over and the fightin' done, somehow
We'll find we're still dependin' on the man behind the plow.

S. E. KISER.

More Milk Money

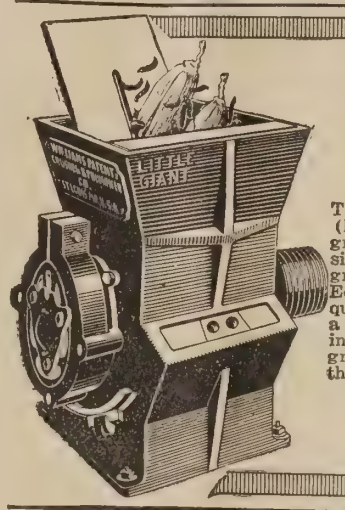
You can get more hard cash profit from your milk cows by feeding

Happy Cow Feed

High feeding costs and uncertain values have put the dairyman strictly up against it, but Happy Cow Feed will set you right again. Results prove it.

Happy Cow Feed is a complete dairy ration which contains, in correct proportions, all the elements needed for economical milk production. Made with or without molasses, as you prefer.

It's a high-grade feed, composed of alfalfa meal, cocoanut meal, wheat bran, cottonseed meal, velvet bean feed, corn meal, unhulled peanut oil feed, rice bran and polish, and ½ of 1% salt.



When you begin to get the maximum yield from your cows and at a greatly reduced cost for feed, you will simply open you eyes and wonder why such a feed has not been offered before.

A life-long experience in making and feeding good feeds proves to us that Happy Cow Feed produces milk at lower cost than any other ration. Write for samples, prices and name of nearest dealer.

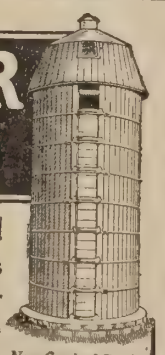
Grind Your Feed



With the Williams Patent LITTLE GIANT GRINDER

The Little Giant Grinder will grind your Ear Corn (husk, cob and all), your Oats, Wheat, or any other grain, into either a fine, medium or coarse meal as desired. It will not merely crack these grains but will grind them into a real meal.

Equipped with genuine SKF ball bearings power requirements are reduced to the minimum. Four sizes give a wide range of capacity. Hundreds of farmers are using this machine, therefore, if you are anxious to save grain and reduce feeding costs investigate and install this machine. Bulletin No. 699 explains in detail.

HOARD'S DAIRYMAN JUNIORS

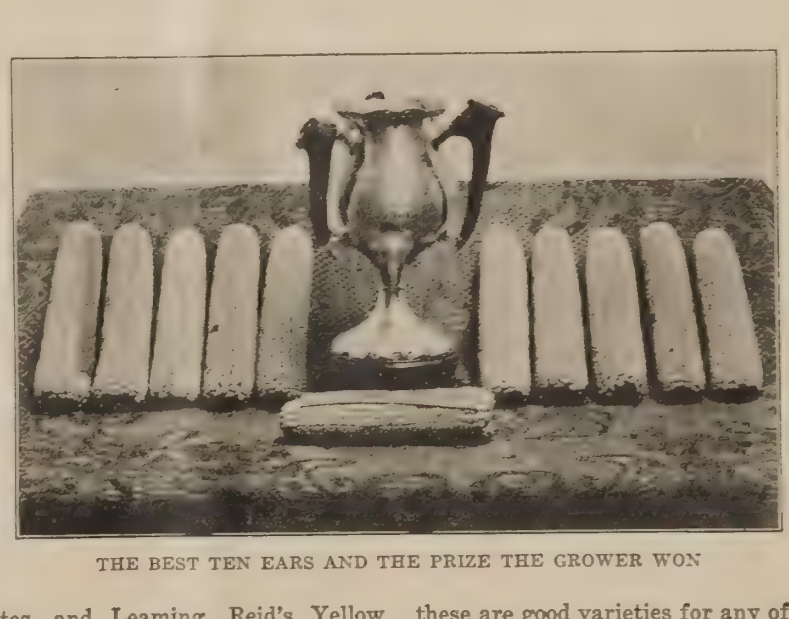
A DEPARTMENT FOR THE DAIRY FARM BOY

Bob's Experience With Pure-Bred Corn

BOB Ramsay was just an ordinary American lad, fourteen years of age, living with his father and mother on their 160-acre farm. Bob was an ambitious fellow and whenever he made up his mind to do a thing he saw it through to the best of his ability. He played the game square and this is what he did.

One day in late autumn as Bob and his friend, Joe Peters, were hustling along over the frozen road to school, they noticed a big poster tacked upon a tree. The boys stopped to read it and started on again without making any comment. Bob was the first to speak. "Say, Joe, do you think teacher would allow us to be absent from school one day next week? I have just got it into my head that I would like to spend a day with father at the farmers' institute advertised on that poster. I don't think father knows about it yet, but I'll bet he will go because he doesn't like to miss anything that is good, and that looks like a good program to me, Joe."

"We wouldn't learn anything there, Bob," replied Joe. "That is just for old people."



"But Joe, it says come and bring the boys with you. They must figure on something good for us or they wouldn't invite the young folks. I am going to ask Mr. Anderson to give us fellows a chance to spend one day at that meeting and I'll bet he'll say yes. You know how enthusiastic he is about stock and grain shows, and there is going to be a big corn and grain exhibit there."

That afternoon as the boys were reciting in their agricultural class, Mr. Anderson mentioned the Farmers' Institute and Corn Show. Now, thought Bob, this is my chance to ask him. "Mr. Anderson, Joe and I noticed on our way to school this morning that there is going to be a big meeting here next week and we made up our minds to ask you to let us attend for one day. I am sure father will not object and I can go with him." Mr. Anderson answered by saying that he had planned to permit the agricultural class to spend at least one day there in order to see the splendid exhibits of corn and grain which would be on display. The boys were delighted and Bob could hardly wait until he got home that night to tell his father.

Bob's class had been studying some things about corn in their agricultural work and he had learned that corn experts at the State Agricultural College had bred some standard varieties of corn that were especially adapted to certain regions of the state. Bob was very much interested in these because he figured some of them must be much better than the kind his father was growing which matured only a few years out of several. Besides, his father was disgusted with his crop that season because it was no where near ripe when the first frost turned the entire field white. Their silo was only partly filled and Bob knew it would not be the best kind of ensilage either and this meant that their fine herd of cattle would not do well that winter on account of the poorer quality of feed. Mr. Ramsay had remarked several times to Bob that he intended to get a different variety of corn for the next season if he could find the seed.

"I know there are many better kinds of corn, father. Mr. Anderson says so, and he has been teaching us about the special varieties that are recommended for our state, and that nearly every state that grows corn has some varieties which are much better than others. Why, he told us that there are nearly one thousand varieties of dent corn and that there were as many differences as there are between breeds of cattle." He says it is up to every farmer to grow the best kind of corn for his conditions and that the Agricultural Experiment Station will be glad to recommend the best variety for the farmers if they will ask them."

"Then he showed us some ears of the best kinds. Gee, but they were great! I never saw such nice corn and I'll bet if we grew corn like that, I could win a prize in our Junior Club Contest next winter and besides I could pick enough seed corn for ourselves and some to sell too. He mentioned Silver King, Golden Glow, and Early Yellow Dent for the northern states, and Leaming, Reid's Yellow Dent, and Boone County White for the corn belt states. Of course, we would want one of the first three."

THE BEST TEN EARS AND THE PRIZE THE GROWER WON

"I would like to try that Golden Glow kind. They call that Wisconsin No. 12 too. It is surely fine looking stuff. The ears are such a pretty golden yellow with a bright, cherry red cob. They are not so very long,—about eight or nine inches. But then, we can't expect to raise any larger ears this far north. It isn't a rough corn either, the dent in the kernels is just a little crumpled. Johnny Smith said he saw a lot of this corn at the state fair so there must be a good many farmers who like it. I do hope that they will have some of this corn there at the show next week. I'll bet you will like it as well as I do, father. Mr. Anderson says it only takes 110-115 days to ripen it, so you see we ought to always get ripe corn from this."

It had taken some time for Bob's father to grow out of scrubby cattle into a fine herd of good producing Holsteins, and in so doing Bob had learned a valuable lesson; that if there was a best cow, so too there must be a best variety of corn for them, and he was out after it.

Bob was up bright and early on Tuesday morning, the first day of the meeting. He had all of his chores done up by eight o'clock of that morning,—it usually took him an extra hour to do the same work. He was so happy to-day that he even slipped his pet colt a little extra oats and gave the horses a little more rubbing than they were accustomed to.

It was just ten o'clock when the team carrying the Ramsay family whisked into town, and at ten fifteen Bob with his father was seated in the hall among one hundred or more other farmers and their boys.

The program started. The speaker announced that he was to discuss some important points concerning the corn crop. Just what Bob was interested in. "If we are to get the most out of our silos, we must put into them corn that is just about mature," the speaker said. "This means the selection of a corn that will mature under our conditions."

"Exactly what our teacher said," whispered Bob to his father.

"I have here, three excellent varieties of corn, each bred to mature in different regions in these northern states. Of course I am speaking quite largely for Wisconsin conditions, but these are good varieties for any of our northern states growing corn under similar conditions."

"This Golden Glow corn is grown very successfully through the central part of Wisconsin and also in the same latitude in South Dakota and Nebraska. It ripens early and produces large yields, and is excellent for silage."

"Yes, sir," commented Mr. Brown in the audience, "I grew that corn this year and it got ripe. My silo is filled with it and my boy has about ten bushels of fine seed which he picked himself and cured. Why I'll bet his sample of Golden Glow corn will take the first prize at this show."

"You are correct in your judgment, Mr. Brown. The corn has already been judged and your boy has carried off the honors. I noticed that the blue ribbon was on his sample." Everybody gave three cheers for Billy Brown as the champion corn grower. And when Billy announced that he had ten bushels of seed for sale, Bob was not slow in getting him to promise to save enough for him. He paid for it himself because he had a little ready money which he had earned helping Joe Peters' father during harvest time.

"Well, Bob, did you learn very much to-day?" asked Mr. Ramsay as the family sat about the fire that ev- ing.

"Yes siree! I am surer now th- ever that we have been fooling o- selves for a long time about this co- business. And if Billy Brown c- grow prize corn, why can't I? N- father, what do you suppose I d- You remember that five dollars th- Mr. Peters paid me this summ- Well, I gave that to Billy to-day f- one bushel of his fancy Golden G- seed. I only want enough to plant a- acre and then you can have the re- and I want you to rent me an ac- of land because I am going t- join the Corn Acre Contest next su- mer and win some honors for us. If Billy Brown can do these things I can too. I don't like him to beat m- out in everything; you know he a- ways stands higher than I do in ar- metic. But, I believe I can put it o- him in growing corn."

"I'll give you the use of one ac- Bob, for this season. You see this is a kind of an experiment for both of us and if this fancy Golden Glow is wh- they crack it up to be, we'll make a farm, The Golden Glow Farm."

"No, father, I am going to pay y- rent for that acre. This game is goi- to be played square or not at all." So it was agreed that Bob should pay his father $10 for the use of the land an- he was to do all of the work himse-

The next day Billy delivered th- bushel of seed and Bob got busy an- tested every ear. "Billy was rig- father. Every kernel grows and se- how strong they are."

"I call that mighty good seed, Bo- Why you'll get nearly one hundr- per cent stand of plants."

"Billy says this is all heat-d- seed too, and that is another reas- why it is so strong."

It was a beautiful, warm day on th- tenth of May. Bob had spent two da- upon his acre of corn land gett- ready to plant. He hauled out ten lo- of manure and spread that on bef- plowing.

"It seems to me, Bob, that you ar- manuring that acre pretty heav-

"Corn is just like a cow, father. I- get more milk by feeding alfalfa h- and corn ensilage and I'll get m- corn and it will ripen sooner if I g- the soil well. I want it to grow st- when it once comes up and the mo- food it can get the faster it will gro-

"Don't you think you had be- wait a few days before planting? T- soil is a little cold yet and your s- may not grow very fast."

"I am going to take my chances t- plant to-day," answered Bob. "Y- know they told us last winter at o- institute that with good, strong s- there is little danger in planting a few days earlier."

Bob grew a bumper crop. He w- proud of it. He kept it clean. Ha- a weed could be found. Mr. Ander- brought his class out to see it and p- explained just how he grew such a fine looking crop.

On the tenth of September he started to pick seed. Joe came over to help him. They selected twenty bush- of the choicest ears that day. "Nic- ing doing, Joe," as he began to str- Bob's fine seed on the windmill fra- "We don't let our cows stay out- on cold winter days and in a- weather. My corn can't be treated that way either. Why, those lit- plants inside of the kernels mu- freeze to death before they were de-

out, and then what would I do for seed next spring? No, sir! this corn is going to be hung up in that room over the kitchen. There is lots of heat comes from the stove pipe running through that room."

Bob husked the rest of his corn and found that after weighing it up, allowing 80 pounds for one bushel because it was not yet dry, that he had seventy bushels more. He sold this to his father at 75 cents a bushel. "I am making money pretty fast," Bob figured. When all of the yields of the contest were in, Bob found his name heading the list. He raised ninety bushels to the acre and that was two bushels more than Billy Brown had produced.

One rainy, cold day in November Bob went through his twenty bushels of seed and selected the twenty-five best ears he could find. He was making up a sample of corn to exhibit at the Junior Contest to be held in December. With the twenty-five best ears before him, he set out to match up ten of the best.

"Why don't you take this ear, Bob, for one? It looks better than that last one you selected."

"I know that. But I am afraid it has some mixture in it. Those kernels with the white crowns, I believe, are mixed with white corn and I know how it happened, too. Jim Rogers grew white corn right near ours and that is how they got mixed. I'm going to get him to grow this kind next year. It's better, anyway, than that white stuff of his. No, I can't use that ear. I don't want the judge to rule my sample out on account of mixture. Pure corn or none at all in my sample. I am going to play square."

Bob's sample took second prize, for which he got five dollars. "Well, I guess we are even now, Billy, I raised more corn than you did, but you made up a better sample. I am going to try this experiment again next year and you'll have to look out, because I have already sold seed corn to a lot of the other boys and they are coming in on the Acre Contest too. This is great sport, Billy, and I am learning more things about corn than I ever dreamed of."

Junior Letters

Hoard's Dairyman Juniors:—I am 12 years old now and in the 7th grade. The principal teaches me arithmetic and the assistant principal teaches the rest of my studies: 94 is my lowest mark so far. There is one more examination yet.

There are plenty of gray squirrels around here but not many rabbits. The hunters might shoot some of my tame rabbits if they happen to see them. Some of my rabbits got out when they were small and we were unable to catch them. They are large as wild rabbits now.

I have taken my calves from the pasture and I hardly knew them when I saw them. I thought that some of our neighbor's calves had got in with our cows.

We have lost one horse, two cows, one yearling, and one or two calves this year.

Well, my letter is getting rather long so I will have to close for this time. If any of the juniors would like to write to me my address is Carbondale, Pa., R. F. D. No. 1. Wishing the juniors good luck. Myrle Lee.

Hoard's Dairyman Juniors:—I have just finished my chores and am writing a few lines to let you know I am still a junior.

We live on a 52-acre farm. We have 10 milch cows. One is drying up and will freshen in December. We have 2 horses, 18 hens, 1 pure-bred registered Guernsey bull, and a grade Guernsey heifer. My heifer has given nearly 4,000 lbs. of milk since freshening in March.

I am buying a $50 Liberty Bond with the profits of my heifer. I have joined the Christmas Club. I am in the fourth grade in school and 9 years old. I help on the farm. I feed the horses and the hens and the cows. I can cut corn. I go to the milk station every morning alone. Our school is closed on account of the influenza. It is bed time now. Wishing all the juniors good luck.

New York. George A. Earl, Jr.

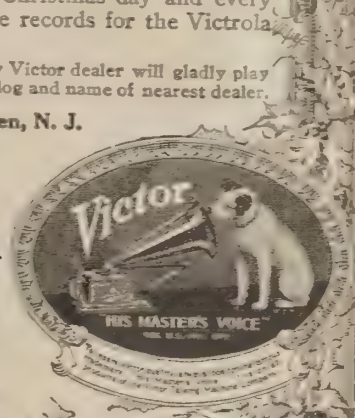
Hoard's Dairyman Juniors:—I have been plowing. I have about 33 acres plowed now and have 13 acres of corn land left to be plowed. We milk 12 cows in the morning and 13 at night. I milk 4 cows in the morning and 5 at night. I sold one of my boar pigs yesterday for $55. We have 4 work horses and a 2-year-old colt.

Minnesota. Eddie J. Anderson.

Will there be a Victrola in your home this Christmas?

ITS USEFULNESS—ITS SERVICE— is beyond computation for it brings the ministry of music into your home.

Christmas morning with a Victrola in your home! Here are Caruso, Alda, Braslau, de Gogorza, De Luca, Farrar, Galli-Curci, Garrison, Gluck, Homer, Martinelli, McCormack, Melba, Schumann-Heink, Scotti, Whitehill, Witherspoon, and other great vocalists to sing for you.



Another moment and in come Elman, Jascha Heifetz, Kreisler, Paderewski, Powell, Zimbalist, and other famous instrumentalists to play for you. Then there follow the Boston Symphony Orchestra, Philadelphia Orchestra, Sousa's Band, Pryor's Band, Conway's Band, Victor Herbert's Orchestra, and other celebrated musical organizations to entertain you. And you have, too, Harry Lauder, Marion Harris, Raymond Hitchcock, and other comedy "headliners" to cheer you with their merry music and wit.

Such a Christmas as that will be! And every home can have this superb entertainment on Christmas day and every day, for all these great artists make records for the Victrola exclusively.

Victors and Victrolas, $12 to $950. Any Victor dealer will gladly play any music you wish to hear. Write for catalog and name of nearest dealer.

Hollander, single, thirty years, wants charge small herd, Jerseys or Guernseys. Good milker, experienced, sober and honest. State wages. E. FABER, 208 Passaic Ave., Clifton, New Jersey.

ome War-time Factors in Southern Dairying

ARD'S DAIRYMAN:—A market existed for more dairy products southern dairymen can put out. s are not unsatisfactory—per- much better than in most other ons of the country.

the feeds are produced on the and are to be valued at only they cost to produce, the south- dairyman finds that his velvet s, sorghum, and corn silage, cow- and sorghum hay have cost him o much more than ordinary. If eeds are purchased, then to the t that they are purchased has und the war no promoter of his erity. Last year, and even be- last year, the cottonseed meal s advanced in a way that dairy ucts either did not have the or the ability to follow. But government interest in the mat- f cottonseed meal there came a stabilization, while dairy ucts sought very slowly and hesi- gly for higher levels.

e large number of cantonments South has enlarged the demand iry products, a demand that has een fully met. Soldiering is as- ed with some deprivations, so ldiers began with denying them- of milk and butter,—until they a restaurant in town. Officers, ver, who control their food sup- ave created a demand at the nments which has been of no proportions, which, when added e regular local demand, could e properly supplied.

r-time feeding has been the main concern of dairymen. The velvet bean has been resorted to as a very present help in the time of high prices. Depending upon how near the beans were grown to the dairyman and upon the desire to market them, prices varied and in some places were unfavorably high. As a whole, however, velvet beans have helped out very materially. Where legume hays are being fed, such as cowpeas or cowpea and sorghum combined, velvet beans have been considered rich enough in protein to solve that part of the feeding problem. Where silage and velvet beans have been available, the practice of adding cottonseed meal is considered correct.

While some dairymen claim to have obtained good results from feeding no other concentrate than velvet beans, it is not generally believed that this is a wise practice, especially when cottonseed meal is ranging around its present price. Therefore, while the dairymen have been bearing down on the velvet bean heavier than usual and saving themselves some cost, as a rule a combination of silage, velvet beans, and cottonseed meal in right proportions, will give better results.

Dairymen are finding that beans soaked for a few hours give quite as good result as feeding them ground, hence a saving in labor. How generally this practice has proven its merit, is not known, but some carefully conducted experiments recommend it.

Labor has been the one cost in dairying that has advanced most. Because it is an early and late sort of labor, it has been difficult to supply. Even when a sorry kind is obtained, competition is so great that it is hard to hold it. Dairying, therefore, has had to stand a greater increased cost in labor than probably any other industry.

Dairying in the South has suffered from losing quite a number of the government and college specialists in extension work. Much of the extension work of all agricultural lines was being performed by young men who were among the first to go to the war. It has been no easy matter to replace these workers, and projects which they had well under way are languishing. One of the results of the loss of these workers has been less interest in purchasing pure-breds than would otherwise have been the case at this time.

Georgia. CHARLES A. WHITTLE.

War Pork on Soy Beans

HOARD'S DAIRYMAN:—Dollars may come, but dollars do go in these war times. Most men are patriotic but we cannot expect a farmer to be patriotic and raise more pork unless he receives a reasonable return for his efforts. How the eastern farmer may get these returns is shown by the results of an experiment finished October 20, at the Delaware Experiment Station.

Ten crossbred Berkshire-Yorkshire pigs averaging 157.5 lbs. each were placed in a five-eighths acre lot that had been seeded broadcast to Wilson soy beans on May 3. The beans were hardened and the pods turning when the pigs began the operation of converting them into pork on September 10. The forage was exhausted on October 20.

GUERSNEY BULL, LANGWATER EMIGRANT, OWNED BY H. W. BATEMAN, WASHINGTON

The sire of this bull is Jethro Bass, that is out of Imp. King of the May and Dolly Bloom; and his dam is by May Rose King and out of Imp. Pride of Home. His four nearest dams have A. R. records averaging 677.65 lbs. fat. Mr. Bateman is not afraid of an aged bull, for Langwater Emigrant was ten years old when he recently purchased him from Calkins & Riggs of Oregon. Note that exercise is provided for this animal.

In addition to the forage these pigs were given constant access to hominy feed and digester tankage in separate feeders. The table below tells the whole story:

Number of pigs raised	10
Number of days fed	40
Average initial weight September 10	157.5 lbs.
Average final weight October 20	228 lbs.
Total gain of group	704.7 lbs.
Average daily gain per pig	1.76 lbs.
Total hominy feed consumed	1953 lbs.
Hominy feed eaten per pig daily	4.88 lbs.
Total tankage consumed	148 lbs.
Tankage eaten per pig daily	.37 lbs.
Total grain consumed	2101 lbs.
Total grain eaten per pig daily	5.25 lbs.
Hominy feed consumed per 100 lbs. gain	277.1 lbs.
Tankage consumed per 100 lbs. gain	21 lbs.
Total grain consumed per 100 lbs. gain	298.1 lbs.
Grain cost per 100 lbs. gain	$7.98
Total soy bean forage consumed	.625 acre
Forage required with grain per 100 lbs. gain	.0886 acre
Pork from one acre of soy beans with grain	1127.5 lbs.
Cost of grain to produce 1127.5 lbs. gain	$89.97
Value of pork produced on one acre of soy bean forage with grain, pork selling at $20	$225.50
Returns from one acre of soy bean forage	$135.53

The five-eighths acre of soy beans furnished good forage for the ten head for forty days. At this rate one acre would pasture twenty-one and one-third pigs for thirty days, and this is about the proper length of feeding period to get the most out of the forage.

The pigs gained 704.7 lbs. during the period at the rate of 1.76 lbs. each daily, and finished at the satisfactory market weight of 228 lbs. Their condition was prime and their dressed percentage excellent when they went to market.

The feed consumption is a very pertinent question here. What did these pigs do? They ate on an average 4.88 lbs. hominy feed and .37 lb. tankage daily beside their dessert of soy beans. To make 100 lbs. increase in weight they only require 298 lbs. of grain. Figuring hominy feed at $50 per ton and tankage at $100 the cost of grain for 100 lbs. increase in live weight is $7.98.

Five-eighths of an acre of soy beans was consumed by the ten pigs in forty days. The area of forage required with grain to make 100 lbs. gain was .0886 acre. The amount of pork produced on one acre was 1,127.5 lbs. To make this 1,127.5 lbs. of pork there must be an outlay of $89.97 for grain. These pigs sold for $20 per hundred weight. The value of the pork from one acre of soy beans amounted to $225.50. The net return from an acre of soy beans is the neat sum of $135.53.

The above results are not overdrawn but represent what can actually be accomplished by ordinary business-like methods. The fact that the self-feeder was used and that the pigs gathered part of their own feed is no small item when labor is at a premium. Moreover, the manure was deposited over the pasture lot free of charge. Can there be a more inviting field of service for the farmer in these strenuous times than the making of pork on forage crops?

FRANK A. HAYES.
Delaware College of Agriculture.

Breeding Paid

HOARD'S DAIRYMAN:—At a sale last week where a herd of dairy cows was dispersed, eight cows of unknown breeding sold at an average price of $61. Sixteen grade Guernsey cows and heifers sold at an average price of $150. The sixteen grades were sired by a son of one of the famous bulls of the breed. The extra cost of the pure-bred sire was returned many times in the extra $90 that was received for each of his offspring, to say nothing of the increased production.

Maryland. G. E. WOLCOTT,
Dairy Husbandman.

This Champion

Brown Swiss

—a five-year-old, has made the remarkable yearly production record of 16,804.4 lbs. of milk and 727.64 lbs. of butterfat. Not every dairyman has a cow that could equal that record, but almost every one has several cows that could produce far more than at present, if they were as perfect in health as this animal.

No matter how well you feed or care for your dairy cows, you must remember they have vital organs that get out of order, just as human beings have. And nowadays there's

A Premium On Health!

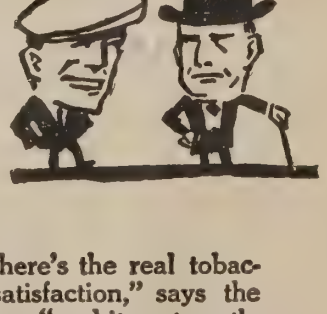
Never before has it paid so handsomely to get every extra pound of milk from every cow in the dairy. You can see the profit in milk, now.

The digestive and genital organs are the seat of practically all disorders in cows. Barrenness, Abortion, Scouring, Retained Afterbirth, Lost Appetite, Bunches and other cow ailments usually arise from "forcing" the cow's production without aiding nature in the rebuilding process.

KOW-KURE has met with great success in the treatment and prevention of cow diseases because it acts on just the organs that the troubles start in—toning them up and aiding the cow to produce and reproduce with regularity. And the value of KOW-KURE for the prevention of these diseases is no longer questioned by dairymen.

Send today for your free copy of our book,

"The Home Cow Doctor"



It tells proper treatment for each disease and gives much general information of value to dairymen.

Buy KOW-KURE from feed dealers or druggists; 60c. and $1.20 packages.

DAIRY ASSOCIATION CO.

the spring. Since he has been co ing the cement with planks there been no serious udder trouble in herd. Another practice not comm observed is that of mixing salt the feed before giving it to the c He believes that cows appreciate feed and salt mixed just as human

Raising Calves

Mr. Beelman is especially suc ful in raising calves. At the pre there are 21 calves in the barn. calves have been lost during the year and but two or three in the preceding years. Regularity and in feeding receive the credit fo fine looking calves now in the After birth the calves are left their mothers for three or four They are then fed two parts v milk and one part skimmilk. The portion of skimmilk is graduall creased so that the calves are re ing no whole milk when they three weeks old. At that age young stock are taught to eat Grain is thereafter fed in quan sufficient to keep the young an growing thriftily. By feeding immediately after skimmilk, it been their experience that the c do not suck one another. With so high in price the manager that he can economically feed skimmilk until the young animal one year old. Much sickness a the calves is avoided by having e thing absolutely clean. All pail of which the calves are fed are ilized daily and then allowed to in the sun.

Disposition of Product

The product is all sold as crea a fat basis. When the milki about two-thirds done the sepa is started so that the separatin be finished very soon after the ers are through. The motor that the separator also pumps water runs through cement tanks. cream cans are placed in these where they are immediately As soon as the cream is thorc cooled it is hauled to the railroa tion where part is shipped to cream factory and the remainde local creamery. Because of the tary conditions which prevail thr out the entire barn and milk the cream is sold at a premium the ordinary market price.

Interesting Dairy Notes from

(Continued from page 691)

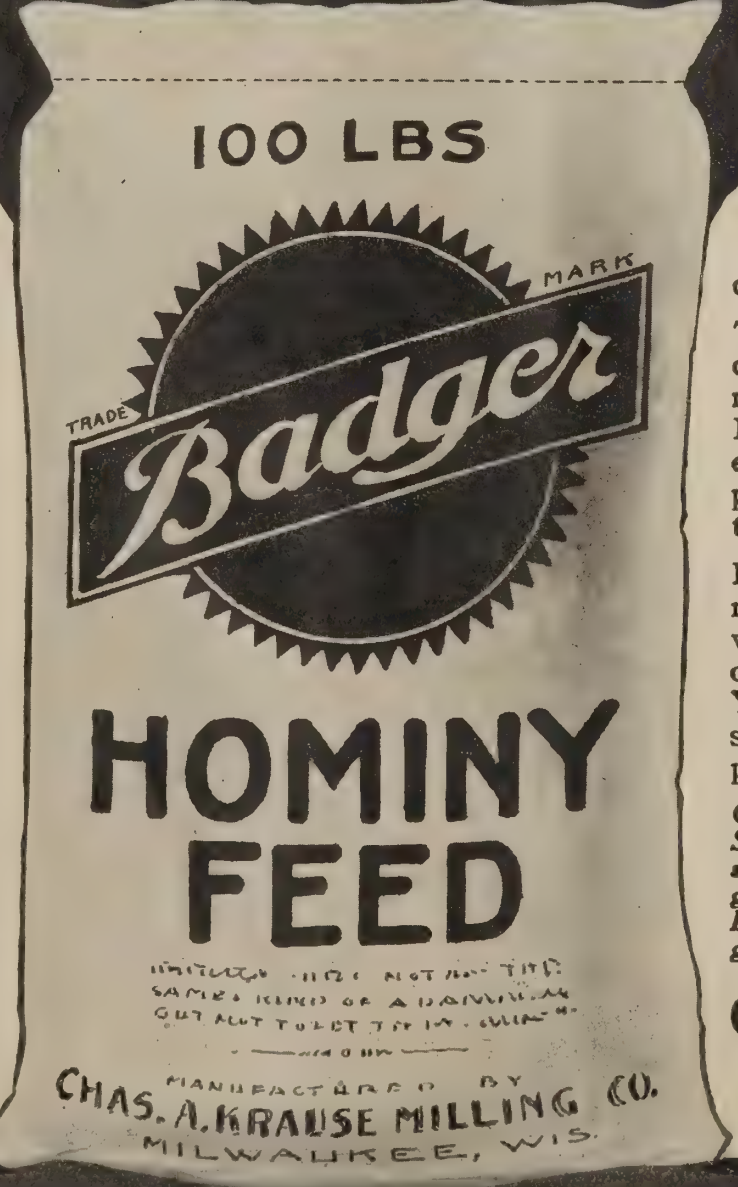
$135 and higher prices prevai Curiously enough heifer calves little demand. At one sale brought less than real prices, i ing little faith in the future. dairy stock represented here pr half of the total is Jersey blo lowed by Holsteins and a few seys. Mostly, however, we scrub stock and the redder a and the broader across the the more we bid for her at Some folks would call them "s but when we try to sell them w to them as "milking Shorthorn

In general in the southern section conditions for dairyi the present and immediate look promising and it should b vorable time to locate here fo one who has capital, cows, a ability to handle them. The is moderate, requiring but co tively small expense for housin or feed; the market is good likely to remain so; and the s yield heavily of the crops of the dairy cow is fond. In fact are only two things necessary t this a great dairy country, some cows and some dairymen

HE BADGER LINE of FARM FEEDS

THE FEEDS WITH A HOMINY FEED BASE

[IVE famous ger Feeds, made from oved formu- the result of s of careful feed- tests by practical ers.



the base of each Bad- Feed is ***Badger Hominy l, the most nutritious sin- feed stuff known.***

ger Hominy Feed needs no in- uction. It has been known and for many years by the most essful feeders in the country. It carbohydrate feed that can be for all live stock—no other feed will take its place.

ger Hominy Feed is superior in ing value to the natural grain use it contains a larger percent- of tissue building material than whole corn and in the process of ng is partially cooked which es it more digestible. In it is included the mill run of Corn n Meal—the germ or fatty part ne corn from which the oil has partially extracted. This makes ger a far more valuable feed any other ordinary hominy feed he market.

uable as Badger Hominy Feed is base, it is too rich to be used nomically alone except in a very cases.

secure the correct proportions of eins, fats and carbohydrates,

Badger Hominy Feed should be combined with various other feed stuffs.

But in these times of extreme labor shortage, successful feeders cannot take the time to mix their own feed. They know also that the feeds they mix themselves cannot be as scientifically accurate and dependable as feeds that are prepared under tested and approved formulas and are chemically correct.

The proteins, fats and carbohydrates contained in different feedstuffs differ not only in quantity but in quality. Each Badger Feed contains a different combination of ingredients so proportioned as to make it exactly the right feed for its special purpose.

Badger Feeds are proved money makers, to which thousands of feeders will testify. They will cover the needs of every class of stock on your farm. You will find them absolutely reliable, splendidly adapted to their specific purposes and unvarying in quality.

Get your supply of Badger Feeds now. See your dealer at once. Send for free samples and literature covering Badger Cream City Dairy Feed, Krause Dairy Feed, Badger Calf Meal, Badger Hog Feed and Badger Stock Feed.

Applied Patriotism

Woman has made herself indispensable to the Nation's war activities. This is being demonstrated daily in many splendid ways. The telephone operator takes her place in the front ranks of our "national army" of women.

Back of the scenes, invisible, her war work is to make telephone communication possible. Through her the Chief of Staff in Washington speaks to the Cantonment Commandant in a far-off state. The touch of her fingers forges a chain of conversation from Shipping Board to shipyard, Quartermaster General to supply depot, merchant to manufacturer, city to country, office to home.

Without her this increasing complexity of military, business and civil life could not be kept smoothly working. Hers is patriotism applied. She is performing her part with enthusiasm and fidelity.

The increasing pressure of war work continually calls for more and more telephone operators, and young women in every community are answering the summons—cheerfully and thoughtfully shouldering the responsibilities of the telephone service upon which the Nation depends. Each one who answers the call helps speed up the winning of the war.

Maine Dairymen and Breeders Meet

(Continued from page 669)

lege of buying them. Maine could then have her children back home.

Secretary Houston spoke of the war and the causes leading up to it and closed by praising the farmers for what they had done to help in the feeding problem. Last year the acreage under the plow was 23 million more than in 1917 and the outlook for the coming year was still better. His department was ready to aid in the betterment of rural life in every way.

Maine. MARY B. AIKEN.

Lice on Little Pigs

We have 19 little pigs two weeks old and we notice they have lice. For the mothers we use kerosene and creosote, but don't know what to put on the little fellows.

Denver, Colo. W. A. W.

Make a solution of coal tar dip according to directions given by the manufacturer and add enough crude petroleum to make a thick scum on the surface of the solution. Dip the pigs in this solution and repeat the treatment when seen to be necessary. Provide new, clean beds. Use the solution warm and afterward protect the pigs against chill until dry.

Watertown Holstein Sale

The Watertown Holstein Sales Co. held their seventh semi-annual sale at Watertown, Wis., Nov. 21-22. One hundred forty-two animals sold for $34,390, a $242 average. This included 110 bulls and 32 females, the former averaging $188, the latter $257. The ten highest priced animals in the sale brought a total of $7,265.

One of the best animals in the sale was Salma Gewina Crescent Beauty, a 2-year-old heifer in W. H. Reed's consignment. She is sired by a 29-lb. son of King Segis Pontiac and her dam with a 31-lb. record has three times made over 30 pounds. Then, too, the heifer is in calf to Sir Korndyke Bess, a grandson of Sir Korndyke Hengerveld DeKol and from a 33.23-lb. daughter of Sir Pietertje Ormsby Mercedes and Spring Brook Bess Burke. Finally, the heifer herself is an excellent individual so that it was to be expected she would command a good price. She was purchased by the Pabst Stock Farm for $1,350.

The highest priced bull in the sale was a 9-month-old double grandson of that famous sire, King Pontiac Champion. His sire is a 31-lb. son of Champion and his dam, with 29.81 lbs. butter in 7 days, 898.59 lbs. in 1 year, is one of Champion's good daughters. The calf was consigned by the Pabst Stock Farm and purchased by E. W. Marty, Wisconsin, for $800.

Cattle from the sale were purchased by buyers from five different states, with R. Glenske of Wisconsin the heaviest buyer.

Haeger, Mack, Hellen, and Donovan did the selling, with S. T. Wood in the box.

Following is a list of all animals selling for $200 or more, prices, and buyers:

Fred Weffenbach, Wisconsin	
Salma Longfield Crescent Beauty	$700
O. J. Len, Wisconsin	
No. 1½	$230
No. 12½	215
Pabst Stock Farms, Wisconsin	
Salma Gewina Crescent Beauty	$1,350
George Hetts, Wisconsin	
Aaltje Grace Hengerveld	$1,035
John Masche, Wisconsin	
Salma Sir Pietertje Bess	$290

The Spirit of the Red Cross Should Enter Every Home

THROUGH the Red Cross all the love of kindred and country, which gives our National soul its greatness, finds expression.

Those who love America, believe in humanity, and have faith in God, must count themselves proud to answer "present" at the Red Cross Christmas Roll Call, December 16th to 23rd, during which period the privilege of membership is to be extended to every loyal American.

Let us grasp this opportunity to make this a Red Cross Christmas.

Let us be able to tell our boys at the front, when we send them our Christmas greetings, that America stands solidly behind the Red Cross—*their Red Cross*—with full membership in every home.

Let us tell them that this beautiful spirit of love, and compassion, and generosity, and unselfish service, has entered every home in our land—from the smallest farm in Maine to the largest ranch in California.

No other message we can send will give them greater courage or encouragement. They know what the Red Cross means to them.

Join the Red Cross

All you need is a heart and a dollar

The JER$EY MAKES A DOLLAR WORTH MORE

Poor cows are like poor help—the more you feed them the less profitable they are. Jerseys make a dollar worth more because they give the biggest yield with the least amount of feed. In these days of conservation, the Jersey is the only breed for the working farmer who wants to lay something by for a rainy day. The least expensive breed to keep the most beautiful and satisfactory breed to have. Buy one Jersey and you will never be satisfied until you have a herd. Write to Breeders for pedigrees and prices. Ask us for the facts that have changed many a cow barn from a liability to an asset

THE AMERICAN JERSEY CATTLE CLUB 351 WEST 23rd STREET, NEW YORK CITY

Proper Hog Management to Avert Pneumonia

Swine Plague or Septicemia Hemorrhagica has been prevalent among hogs in Indiana for the past six months. A heavy death rate is uncommon except in such herds where pneumonia develops. Changeable weather is always favorable to pneumonia and especially when the resisting power of the body is lowered by exposure or some other disease. Damp beds, draughts, dust, and allowing too many hogs to pile up in one bed affords an excellent opportunity for pneumonia to strike its deathly blow.

We are now approaching the time when severe weather may visit us and we can help eliminate a possible chance of pneumonia developing in our herds by resolving:

First: To clean and spray interior of house with a strong solution of disinfectant.

Second: To eliminate all drafts.

Third: To bed with plenty of straw and change frequently.

Fourth: To divide large herds, thus preventing piling up and the hogs getting too hot.

Very few take the precaution they should in warding off disease. We should never lose sight of preventive measures and trust to any marvelous cure to be administered after pneumonia has found its way into the herd. About the only thing that can be done for such unfortunate herds is good nursing; therefore, if such time had been spent in advance of the disease the herd most likely would have escaped trouble. Proper management is bound to avert disaster.—INDIANA COLLEGE OF AGRICULTURE.

The United States exported 14.6 per cent of its wheat crop in the five years preceding the war, 1.7 per cent of the corn, 38.3 per cent of the tobacco, and 69.1 per cent of the cotton. In the three years before the war, this country exported 1.1 per cent of its oat crop, 4.4 per cent of the barley, 2.3 per cent of the rye, and 0.5 per cent of the potatoes.

WE OFFER

BOX 13, - BIG VALLEY, A

Sir Inka Prilly Segis Albino

Born Dec. 3rd, 1917.

Real Bull For Some Small Breeder.

IF YOU ARE A SMALL BREEDER or beginner in the Holstein business and in the market for a herd sire, here is one that is worthy of your best consideration.

JUST A YEAR OLD—Ready for service. He is well grown, a splendid individual with faultless topline and marked nearly all white. As an individual he will suit the most particular.

SIR INKA PRILLY SEGIS, his sire, is one of the famous sons of the great King Segis, who has proved himself to be one of the greatest, if not the greatest, transmitting sires of the breed.

THE DAM OF SIR INKA PRILLY SEGIS is Inka Prilly with a record of 30 lbs. in 7 days. She is from a 25-lb. daughter of old Prilly and sired by a grandson of this same famous foundation cow.

THE DAM OF SIR INKA PRILLY SEGIS ALBINO is Princess Douglas Urmagel, a 24-lb. four-year-old daughter of Sir Urmagel Burke, a full brother to the 35-lb. cow, Urma Burke, and from the 31-lb. cow, Urmagelsche 2d A.

PRINCESS DOUGLAS URMAGEL is from a 29-lb. four-year-old daughter of DeKol Beets Segis, another well known son of King Segis.

THE THREE NEAREST DAMS of this young bull average over 28 lbs. Two of them being only four-year-olds. His seven nearest dams average 26.93 and his eighteen nearest dams average 26.77.

HE CARRIES THE SAME RELATIONSHIP TO King Segis as Segis Fayne Johanna, the only 50-lb. cow, Fancher Farm Maxie, the world's champion heifer with 47 lbs., and Mabel Segis Korndyke, former champion four-year-old with 40.32 lbs.

HE CARRIES A DOUBLE CROSS of both King Segis and the famous foundation cow, Prilly,—both animals familiar to breeders from coast to coast.

AND WE ARE OFFERING this young bull to you for $650, guaranteed sound in every respect and tuberculin tested by Federal veterinarians.

IF YOU WANT HIM, do not wait to write but send us a wire instructing us to hold for you.

The E. C. Schroeder Farms, Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

If You Want Milky Bulls

Write at once

Winship Stock Farm, Owa'onna, Minn.

A Grandson of

Sir Pietertje Ormsby Mercedes

FOR SALE

He is dark in color like his famous Grandsire. A choice individual. 2 years old. Dam, an A. R. O. daughter of a bull who was ***Grand Champion*** of a ***National Dairy Show.*** A rare bargain. **V. S. Culver, Stillwater, Minn.**

GRANDSONS OF KING SEGIS

Grahamholm Farm has a choice lot all ages up to 10 months. Sired by Sir Winana Beets Segis. He has a 35-lb. daughter, a 30-lb. daughter, and a good number of other great producers.

We also have sons of Dutchland Creamelle Colantha Lad, one of the best bred bulls for yearly production.

Every cow in the herd has an A. R. O. butter record. Come or state your wants. Address **W. J. POYNTON, Mgr., Rochester, Minn.**

Buy Them Young

Buy your herd sire young and save money. You can raise it as cheaply as we can.

We are offering for sale some excellent young sons of Buffalo Skylark Ames, a champion at two National Dairy Shows with a fine list of A. R. O. daughters, and out of A. R. O. dams. Write for full information.

E. H. Kuchenbecker, R. 1, Owatonna, Minn.

3 BULLS — **HOLSTEINS** — **3 BULLS**

No. 1 born Feb. 17 almost white, his dam has A.R.O. rcd. of 20 lbs. at 3 yrs.

Arden Farms Winter Sale

Have You Read of Our Recent World's Records?

We Dislike to "Toot Our Own Horn," But Surely You Cannot Blame Us for Being More Than Proud of the Records We Are Making.

ARE *YOU* THINKING OF STARTING IN THE PURE-BRED BUSINESS? OR ARE YOU LOOKING FOR A SIRE TO HELP IN MAKING *YOUR HERD* ONE OF THE PROMINENT ONES?

THE BULL

IS WHAT YOU WANT. Not *A* BULL, but *THE PROPER BULL* WITH THE PROPER BLOOD LINES TO USE ON THOSE HEIFERS OF YOURS.
WE HAVE RECENTLY GOTTEN UP A LITTLE BOOKLET OF "HOLSTEIN FACTS", WHICH WE ARE QUITE SURE WOULD BE OF INTEREST TO YOU. WE CAN SHOW YOU PROOF POSITIVE OF *WHY PURE-BREDS* AND *THE BEST PURE-BREDS* PAY.
WE HAVE MADE A THOROUGH STUDY OF BLOOD LINES AND WILL BE GLAD TO OFFER YOU SUGGESTIONS AS TO THE *LOGICAL* BREEDING OF *YOUR* NEW SIRE.

WE OFFER:

BULLS FROM DAUGHTERS OF *KING SEGIS PONTIAC COUNT*, WHOSE FIRST TWENTY-FOUR DAUGHTERS TO FRESHEN BROKE MORE THAN ONE HUNDRED WORLD'S RECORDS. A SHOWING NEVER EQUALLED BY ANY OTHER SIRE OF ANY BREED. Surely you have read of the recent yearly records made by two of his daughters. THEY FAR OUTCLASSED THE FORMER RECORDS IN THEIR CLASS FOR BOTH MILK AND BUTTER.
SONS OF *PIEBE LAURA OLLIE HOMESTEAD KING*. Some of them out of the famous daughters of KING SEGIS PONTIAC COUNT. This bull is a splendid show type, which he transmits to his offspring. We thought enough of him to use him on the daughters of our GREAT SIRE. CAN WE SAY MORE THAN THAT FOR HIM?
BULLS SIRED BY *SIR ORMSBY HENGERVELD KORNDYKE*, SON OF THE FAMOUS COW, PIETERTJE MAID ORMSBY.

What More Could You Ask For?

WE OFFER YOU THE BLOOD LINES, THE A. R. O. RECORDS AND THE INDIVIDUALITY TO MAKE RECORD-BREAKING, PRIZE-WINNING HERDS.

Isn't That What We Are Looking For?

Write us for Particulars and Pedigrees, and any other information or advice which you may desire.

J. M. Hackney, Arden Farms, 601 Merchants Bank Bldg., St. Paul, Minn.

HEAD YOUR HERD WITH

A Young Bull of Ormsby Quality

One that has been bred for both production and individuality. A son of

Sir Ormsby Banostine Champion

will exactly fill the requirements. We have a few excellent youngsters by this royally bred sire. Write today for full information.

JOHN B. IRWIN, WOODLAKE AND CLOVER FARMS, Sta. F, Minneapolis, Minn.

Young Bulls From Yearly Record Dams

The dams of these bulls have A. R. O. records of 15 to 25 and yearly semi-official records of 500 to 650 pounds of butter. The offerings are sired by bulls secured from the E. C. Schroeder and other noted herds. These bulls are well marked, heavy bone, straight and large for their age. We Guarantee Satisfaction.

Otter Tail County Holstein Breeders' Association. J. V. Bopp, Fergus Falls, Minn.

A SON OF KING OF THE PONTIACS

The World's Greatest Proven Sire

For $350

This is half his value—but his color is against him, as he is nearly all black. He was born in August, is a splendid individual, and is out of a 19-lb. 3-yr.-old. Don't miss this chance of a life time.

Geoffrey G. Burlingame, Cazenovia, N. Y.

A Chance to Buy a Son of King Korndyke Sadie Vale

At less than half his value, because he is dark in color. $400.00 buys King Korndyke Segis Johanna Ormsby, born Aug. 17, 1918. He is a large growthy fellow and a fine individual. His dam and sire's dam average over 35 lbs. butter in 7 days. Sire:—King Korndyke Sadie Vale, regarded as the greatest sire of his generation. His daughters, still heifers, are making wonderful milk and butter records. One K. K. S. V. Topsy made over 40 lbs. butter as a 3-yr.-old. He also has two other 3-yr.-olds with records over 30 lbs., and two 4-yr.-olds over 30 lbs. He is the sire of the youngest 29-lb. heifer of the breed. Dam:—Anna Johanna Ormsby, A. R. O. record as follows, butter 7 days 29.35, 30 days 122.30 lbs. She is one of the best daughters of Sadie Vale Sir Ormsby. Thus this young Bull has a double cross of old Sadie Vale Concordia.
W. D. ROBENS, POLAND, NEW YORK.

Holstein Heifers

325 High grade heifers 1½ to 2½ years old, bred to freshen this fall and early winter, large, well marked, fine condition.

50 Registered yearling heifers, beautifully marked, very well bred, good size, nice condition, extra fine lot.

35 Registered heifers, bred to freshen early this fall, practically all springing now, fine individuals, bred to good bulls.

Positively the best lot of registered and high grade heifers ever offered for sale in New York State. Buy now before the price advances.
J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Springdale Farms

Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. We are prepared to furnish carload lots of fresh cows, springers or cows due to freshen this fall, also two and three-year-old heifers. If you want large, heavy producing cows it will pay you to see our stock. You will find our prices right. **F. P. SAUNDERS & SON,**
Cortland, New York. Office 50 Clinton Ave. Telephone 116 or 1476M.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.
Henry Stevens and Son, - Lacona, N. Y.

A Grandson of the Famous $50,000 Bull

Here is a show bull, about three-quarters white, born Sept. 27, 1918. His sire is one of the best bred sons of the World's Greatest Sire,

KING SEGIS PONTIAC ALCARTRA

His dam has a junior three-year-old record of 22 lbs. butter and 482 lbs. milk. His ten nearest tested dams average 28 lbs. butter. Price $135. **G. G. BURLINGAME, Cazenovia, N. Y.**

You Can Still Get One But Act Quickly

Nearly all of our sons **and** grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.

KING SUPERBA

King Superba's Dam is the great Milanhurst America De Kol, World's Record 4-year-old, with 1231 lbs. butter in 365 days, and 28 lbs. butter nine months after calving. Eight of her records have never been equaled in all respects by any other cow. Come and see his sons and daughters at the Wisconsin State Fair, Sept. 9th to 14th. (See W. J. Mann & Sons ad.)
BAIRD BROTHERS, Waukesha, Wis.

RUST BROS., WEST ALLIS

Size, good individuality and large 7-day and semi-official yearly records are the points for which our herd is noted. The following are two of our records: Aaltje Salo Netherland Pontiac has 33.3 lbs. in 7 days and 134.8 lbs. in 30 da. Ida Lotta 5th 29.74 lbs. in 7 days at 4½ yrs., 27.12 lbs. in 7 days and 816.9 in 365 days at three yrs. We now have a couple serviceable young bulls from A. R. O. dams for sale.

Need a Bull?

Write and ask us how to get the use of a good bull for two years, sired by a 34-lb. bull—KING SUPERBA, 176125, or PABST KING PONTIAC LAD 129298, and dams with 7-day and yearly records. Dr. David Roberts Stock Farm, Waukesha, Wisconsin.

KING SUPERBA

Those who did not meet his sons and daughters at the Wisconsin State Fair have seen by the report in agricultural papers how they took the firsts and Junior champion. Individually they are correct, from A. R. O. dams.
W. J. Mann & Sons, R. 1, B. 16, Waukesha, Wis.

BELLEVIEW STOCK FARM

Breeds the big, high producing kind. We are now offering for sale a few good sons and daughters of Aaltje Salo Johanna Pontiac 57169.
E. B. WATROUS, - Troy Center, Wis.

We Offer Three Young Bulls

4 mos. of age sired by Sir Pietertje Ormsby Mercedes 43d whose dam and sire are among the greatest of the breed. They are out of high producing A. R. O. dams. Send for photo and pedigree. Herd on U. S. Accredited List. We will price these bulls cheap because they are young. A good chance for your next year's sire.

YOUNG BULL FOR SALE

I am now offering an excellent young bull dropped February 27.

His Sire: A son of King Segis Pontiac Polkadot, that has 100% the same breeding as K. S. P. Alcartra, and from one of the good daughters of Korndyke Wayne Paul De Kol. **His Dam:** Rosa Queen Herbert De Kol, a 22.5 lb. junior, 4 year-old. This calf is well grown and a remarkably fine individual.

A few other bulls up to 11 months old, and several females for sale. Every animal guaranteed.
HALSEY SEDGWICK, Limeridge, Wis.

HIGH GRADE HOLSTEIN

Calves, either sex, from heavy producers, well marked, 4 to 6 weeks olds, 15-16ths pure. $25 each, crated and shipped to your station. Express and all charges paid here.
Highland View Place, - Whitewater, Wis.

For Sale—Registered Holsteins

We still have left two young bulls, excellent breeding, one about eight months old, the other about eleven mos. old, backed by splendid seven day as well as yearly records. Also four beautiful heifers, two of them about 18 months old, sired by Johanna King Segis the 40-lb. sire and out of a good A. R. O. dam. Another one about thirteen months old, her dam a show cow; sired by a 30-lb. sire. Another one about a year old, granddaughter of the $15,000 Sire. Very classy stuff. Must sell because of shortage of feed. Breeders, not dealers.
Elm Leaf Stock Farm, Bear Creek, Waupaca County, Wis.
James McKone, Prop. William Lucia, Mgr.

How About a Herd Sire?

MUTUAL FOBES LONGFIELD DEKOL 82959
A Splendid Son of His For Sale.

The Calf—M. M. Tritomia Fobes Longfield was born Feb. 2, 1918. He is nearly white, as straight as a line, and very well grown.

His Sire—Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters and a large number of younger ones coming on that will be retained in our herd. His sire is one of the good sons of Mooie Mutual DeKol and his dam, a daughter of Homestead Jr. DeKol, made 30.04 lbs. butter, 630.80 lbs. milk in 7 days as a jr. 3-yr.-old; 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days. (World's record when made).

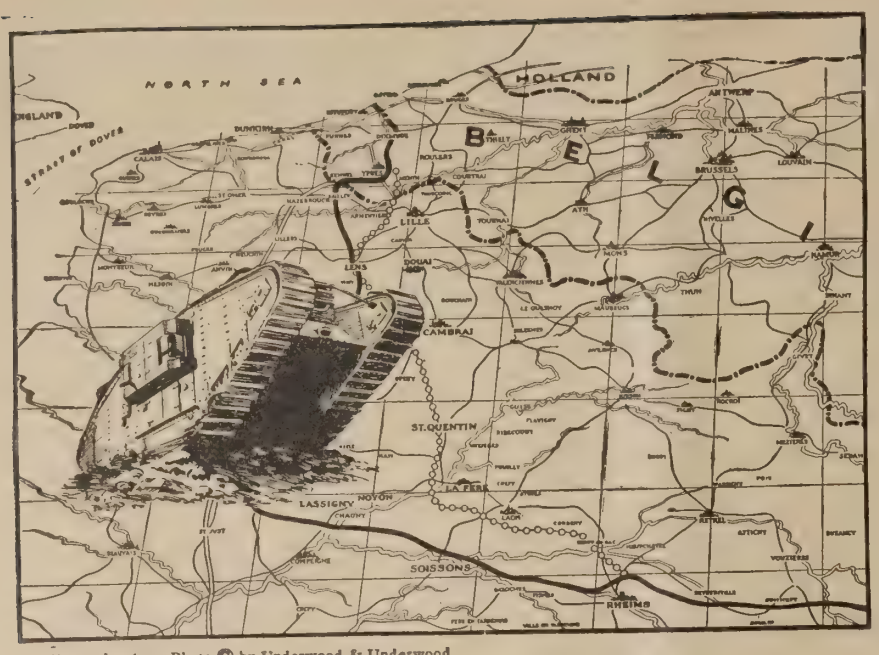
The Dam, Milford Tritomia Fobes Homestead, a daughter of Canary Fobes Bessie Homestead, made 17.35 lbs. butter, 358.2 lbs. milk as a jr. 3-yr.-old; the second dam 17.38 lbs. butter, 408.3 lbs. milk; third dam 22.19 lbs. butter, 488.40 lbs. milk.

This is an excellent combination of breeding, the sire of this youngster and his dam's sire both being from daughters of Homestead Jr. DeKol, both with records above 30 lbs. butter and 600 lbs. milk.

The calf is priced within reach of any small breeder. Write us today for complete information about him.

MILFORD MEADOW'S STOCK FARM, Lake Mills, Wis.

HOLSTEINS Registered and Grade Holsteins of all ages and both sexes for sale. Can furnish several car-loads of excellent females due to freshen this fall, ready for immediate shipment. Several bulls ready for service.



GUERNSEYS We have an excellent lot of grade and pure-bred Guernsey females. Can supply a carload of cows and heifers due to freshen before winter. All in calf to good sires.

PERCHERON HORSES We have several registered fillies and young stallions; also two aged stallions that we will sell for less than their real value if taken at once.

DUROC JERSEYS Anything you want in Duroc Jersey Swine.

All cattle sold on a 60-day retest guarantee. Write us at once before the best ones go.

EDGEWATER STOCK FARM, Fort Atkinson, Wis.

"They also Serve"

BATTERING away at the Huns' defense—the tanks have proved themselves great engines of civilization.

Dragging into position the huge guns to blaze the way to victory, are the gun tractors.

Bringing the German surrender!

Hard at work on thousands of American farms, drawing plows, planters, harvesting machinery, etc., are other engines of civilization—the American farm tractors.

"They also serve."

The tank was the outgrowth of the American farm tractor—War's adaptation of the machinery of Peace.

It would be hard to say which has the greater part in winning the great conflict—the tank and the gun tractor on the western front or the tractor on the American farm.

The part of the tank is spectacular. It thrills us in every fibre.

Crashing through death and destruction in battle, these engines of war must never fail. They must work always—smoothly, efficiently.

The most important single factor in the operation of a tank is Correct Lubrication.

The Allies know this. Practically every British tank on the western front has been lubricated with Gargoyle Mobiloils.

A Captain of the British Army (Tank Corps) recently said:

"Many a time I have gone into battle sitting on a can of Mobiloils and pumping death into the Boche."

Up in Hartford, Conn., one day a photographer was taking a picture of the British Tank "Britannia," recently used in exhibitions in this country. He asked one of the crew to remove the can of Gargoyle Mobiloils that was lying on top of the tank.

"Nothing doing," said the gunner. "It's just about lunch time and the old lady wouldn't know what to do if she didn't have some Mobiloils handy. Snap her as she is."

LESS spectacular in helping to win the war, but none the less important has been the American farm tractor—forerunner of the tank.

The tractor does its work here at home—a very vital work.

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the Red Gargoyle on the container. If the dealer has not the grade specified for your tractor, he can easily secure it for you.

For final victory hangs as much upon food as upon money, munitions or men. Even with the war won, the world will require vast quantities of American food.

It is the tractor's part to speed up the production of food on American farms.

Like the tank, the tractor if it is to operate efficiently must have Correct Lubrication. And the tractor *must* operate constantly, efficiently.

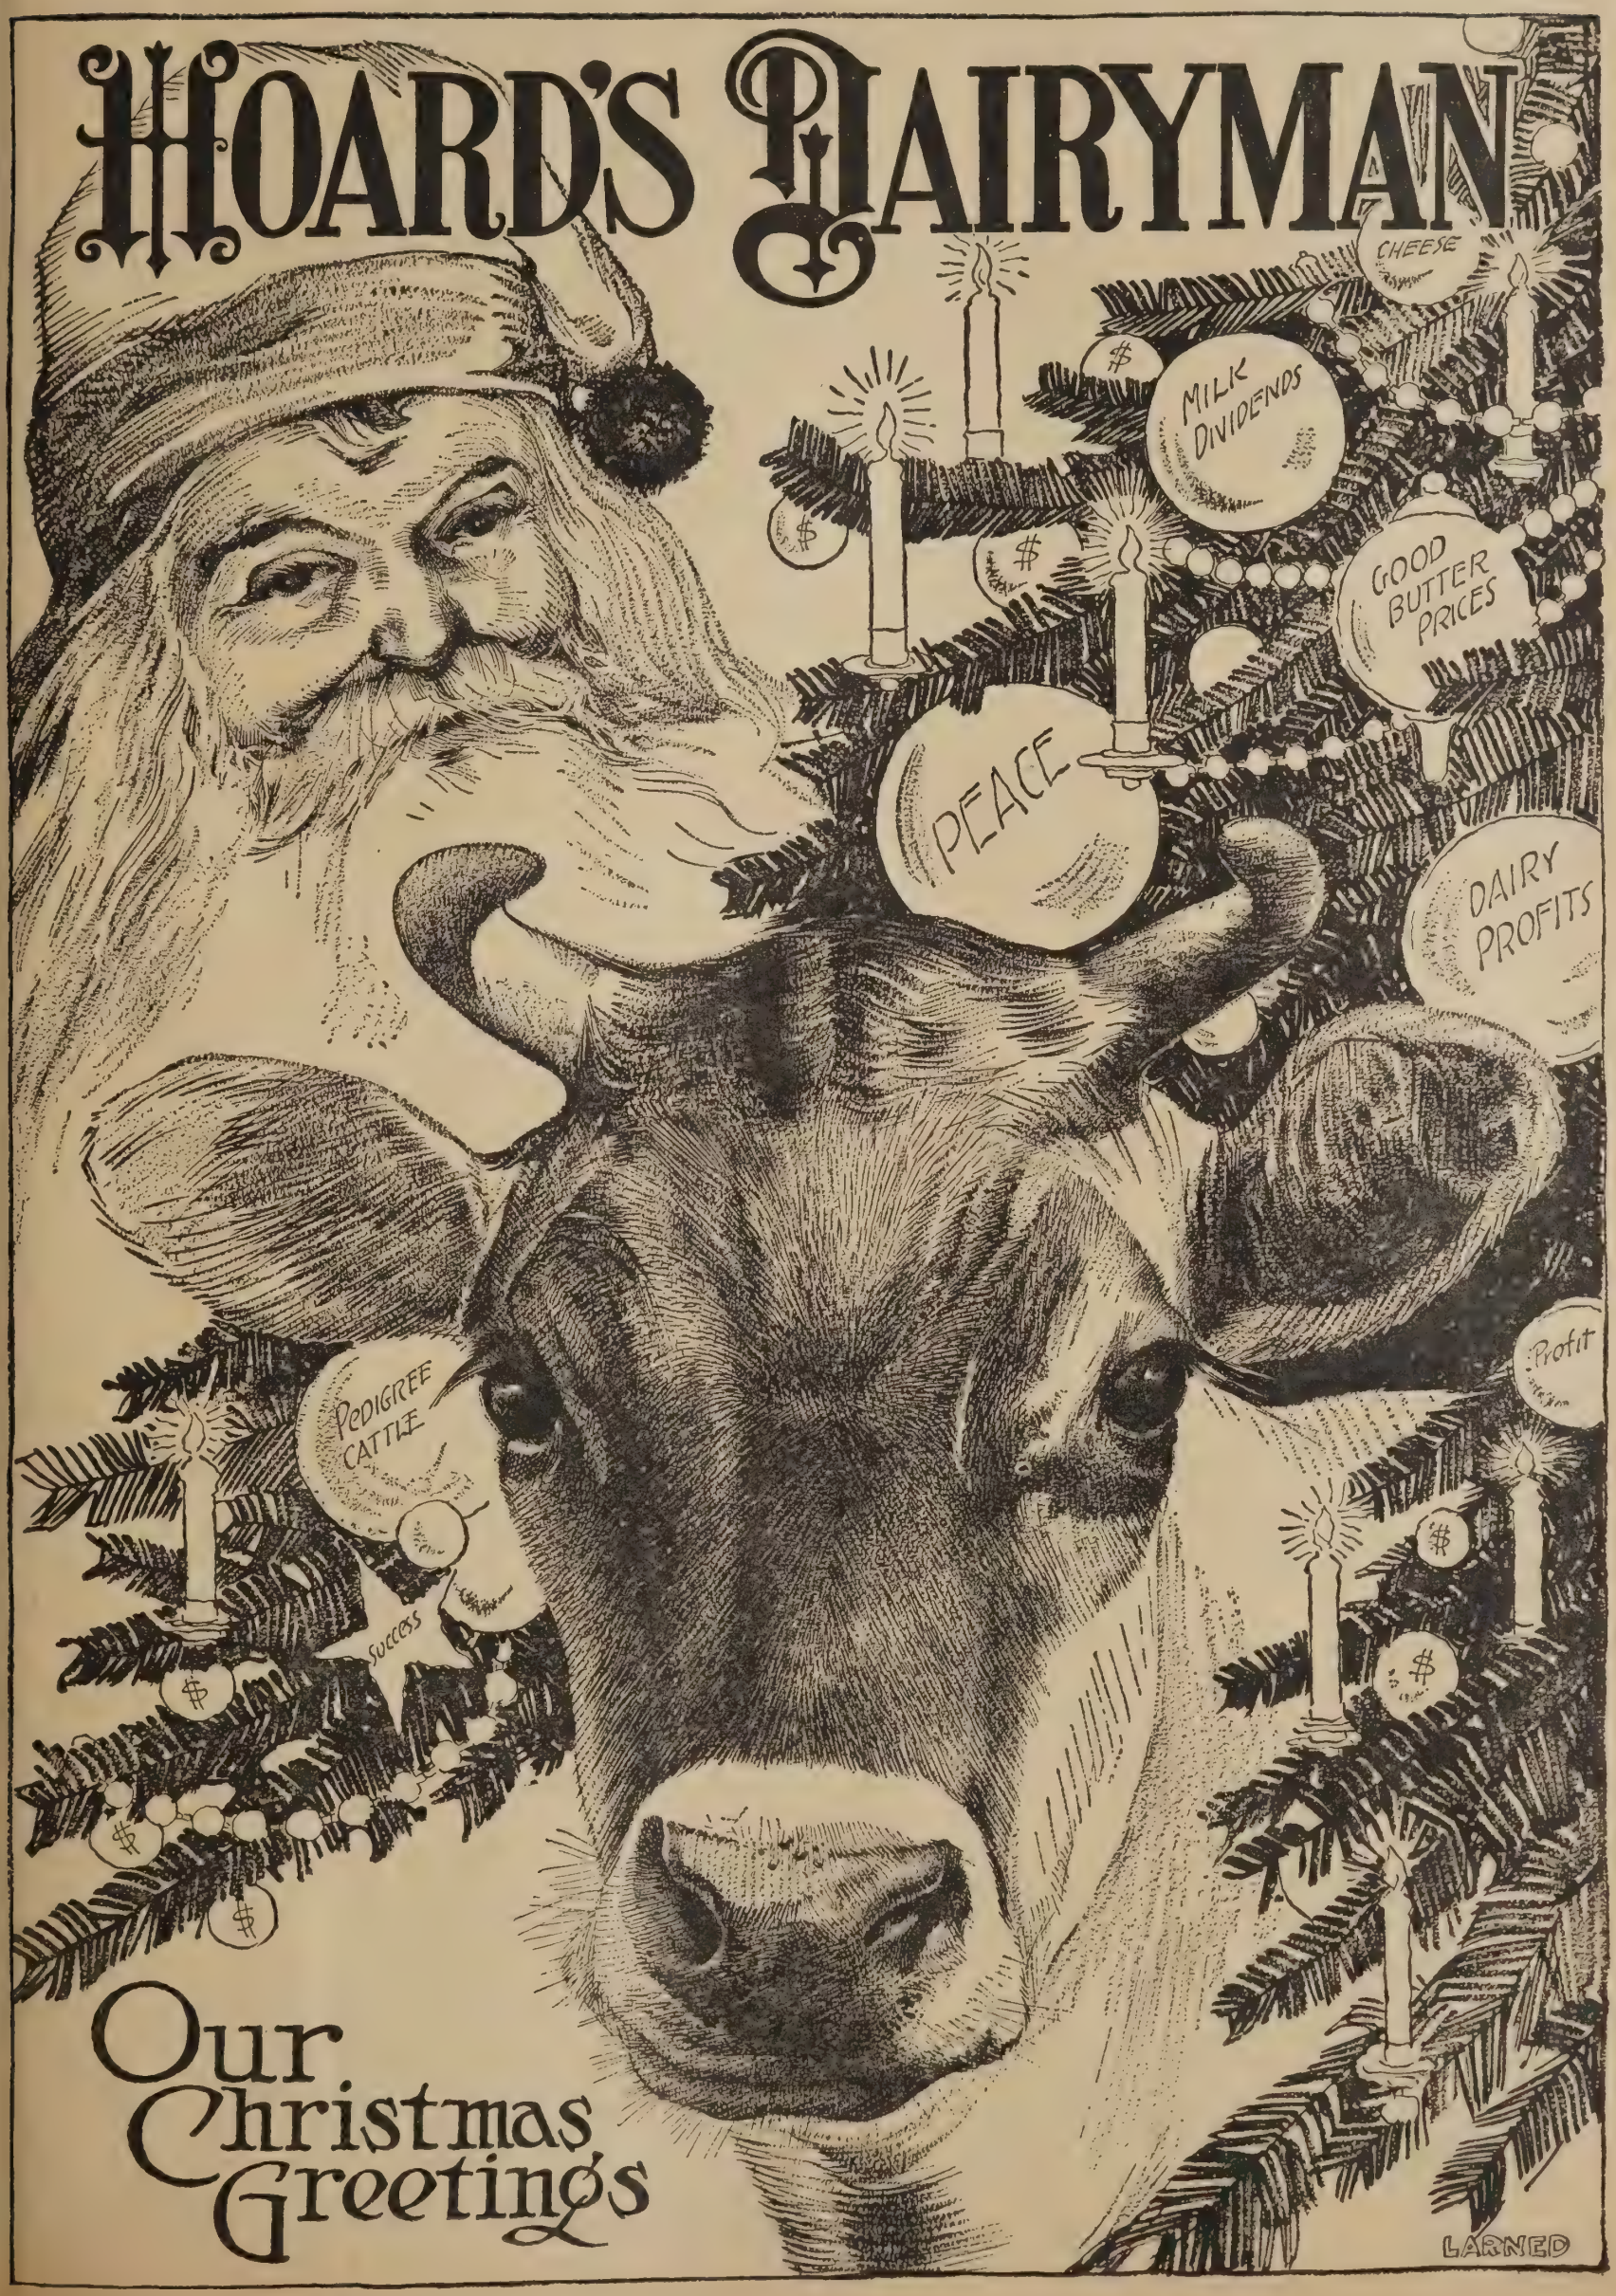
Every breakdown on a farm tractor means loss of time—and loss of food.

The loss on any one farm may seem small, but multiply that loss by the number of tractors in operation and the total is staggering.

Tractor manufacturers and tractor owners have proved to themselves that the correct grade of Gargoyle Mobiloils used in their tractors results in greater power—less fuel consumption—less oil consumption—and fewer stops for repairs.

At the Salina, Kansas, tractor demonstration this last summer, every one of the 47 tractors exhibited was lubricated with Gargoyle Mobiloils. With their tractors on trial before the watchful eyes of thousands of people, the manufacturers were taking no chances with the efficient lubrication of their machines.

On the farm the Correct Lubrication of tractors is vital. For it is upon the farm that the foodstuffs are being produced which helped turn the foe back in the hour of need.



VACUUM OIL COMPANY, New York, U. S. A

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Ayrshire Cow, Canary Bell, Completes Big Record

The Ayrshire cow, Canary Bell, the ten-year-old champion cow of the state of Kansas and owned by the Kansas State Agricultural College, celebrated the signing of the armistice by completing another good A. R. record. Already holding all state records for Kansas, she made another mark for would-be rivals to aim at, finishing a mature record of 19,863 lbs. milk, 744.51 lbs. fat.

Canary Bell was born August 2, 1908. She was bred by Sam Jones & Son, Wisconsin, and owned and tested by Kansas State Agricultural College. She already had four records to her credit:

Milk Lbs.	Fat Lbs.	Milk Lbs.	Fat Lbs.
10,092	371.81	17,375	667.10
12,809	490.74	19,863	774.51
15,252	559.29		

A grand total 75,391 lbs. milk, 2,863.45 lbs. fat in five lactation periods or an average for five years of 15,078 lbs. milk, 572.69 lbs. fat. Her records show a steady increase year by year and with age she has developed into a strong, vigorous animal, capable of still greater work.

This cow's records are all the more attractive because she has produced offspring which promise to rival her. Melrose Canary Bell, a daughter, has a record of 13,891.1 lbs. milk, 505.5 lbs. fat as a two-year-old.

Canary Bell has the highest record of any living cow in the state and her new record is the highest milk production recorded in the Ayrshire Association's mature class this year.

J. G. WATSON.

Management of barnyard manure on farms differs greatly in the same locality and the best yields are usually found where it is given the best care.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Christmas in the Dairy

By rights, if we but did our part,
In justice to the dairy herd,
We'd go, with overflowing heart,
And pass them out a Yuletide word.
We'd wish them "Merry Christmas" too,
"Good will," and all the other things,
And mix them up a special brew
Of which our Christmas poet sings.

We'd deck the barn in garlands green,
With sprays of holly on each stall,
And sprigs of mistletoe between,
As tho' it were a banquet hall.
We'd have a tree—a tree of light,
On which the balanced rations hung,
And while the world outside was white
We'd have some summer carols sung.

A separator, new and fine
Might make a very welcome gift;
Or milkers or some pans to shine,
Some hay that May and June have whiffed.
For, bless the herd, it often makes
Our own glad holidays come true.
Why not give back the good one takes,
When Christmas prompts the heart of you?

I've eaten so many velvet beans this past year," said Uncle Silas, as he sat down to Christmas dinner, "that I feel as if I was plush-lined inside."

This Christmas you might make some holiday gifts to the dairy. Perhaps it's a new silo or a cream separator or add some pedigreed stock to the herd. It's the sort of gift-giving that keeps saying "Thank You" at the bank window all through the year.

Appropriate Dairy Farm Gifts

To Mother—A cream separator that will churn butter at the same time.

To Father—Some new rubber bands for the wallet he will carry next year.

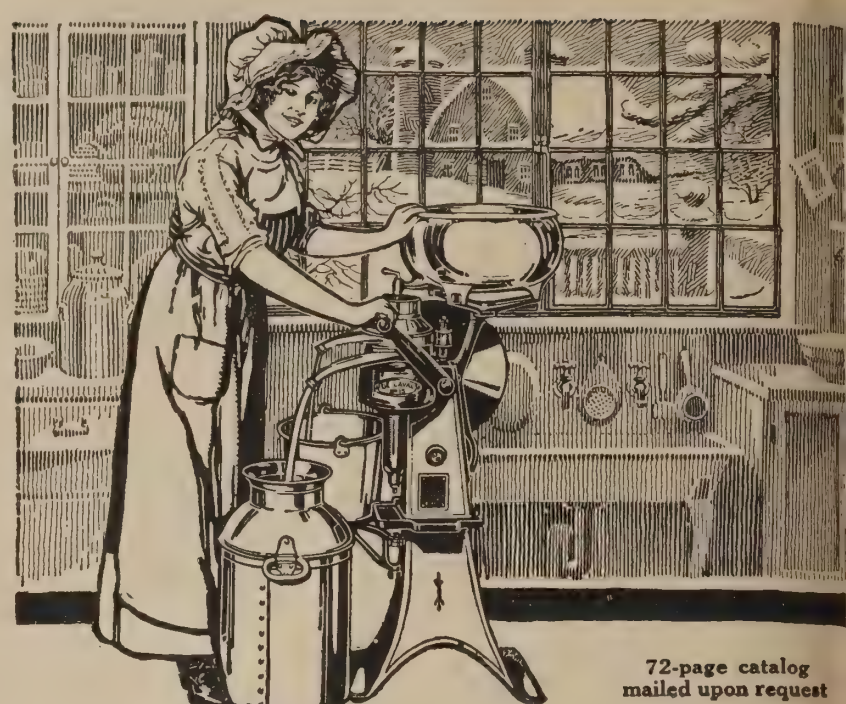
To Brother Will—Substantial proof, with a sprig of holly stuck in it, that life on the farm is more profitable than city life.

To Sister Bess—A year's pass to the movies in town.

To the Hired Man—An alarm clock that refuses to go off earlier than eight o'clock p. m.

To the Prize Holstein—One of her own silver cups filled with lush grass sent from the Sunny South.

"'Twas the night before Christmas and all through the house, not a person was stirring—not even a mouse"—but the rats were holding a Yuletide celebration in the corn crib.



The Good of Giving

Christmas time means giving—
Giving from the heart,
That keeps souls a-living,
It's a holy art.
All year through we're selfish,
Do things for ourselves;
But when spruce and holly,
Show us all our folly,
Come the "Present Elves".

Christmas time means loving,
Grudges set aside.
Quit our growls and shoving,
Hearts are open wide,
All year through, self-centered,
It is always "me".
But when Old Kris Kringle
Makes our good thoughts tingle,
Happiness is free!

If no one anywhere gives any Christmas presents at all this year, peace will go a long ways towards making us satisfied with what we have already.

"Speaking of Christmas presents," said Uncle Ezra, "why not begin to order fertilizer early if you want to play Santa Claus to the new acreage you intend to plant this coming spring?"

72-page catalog mailed upon request

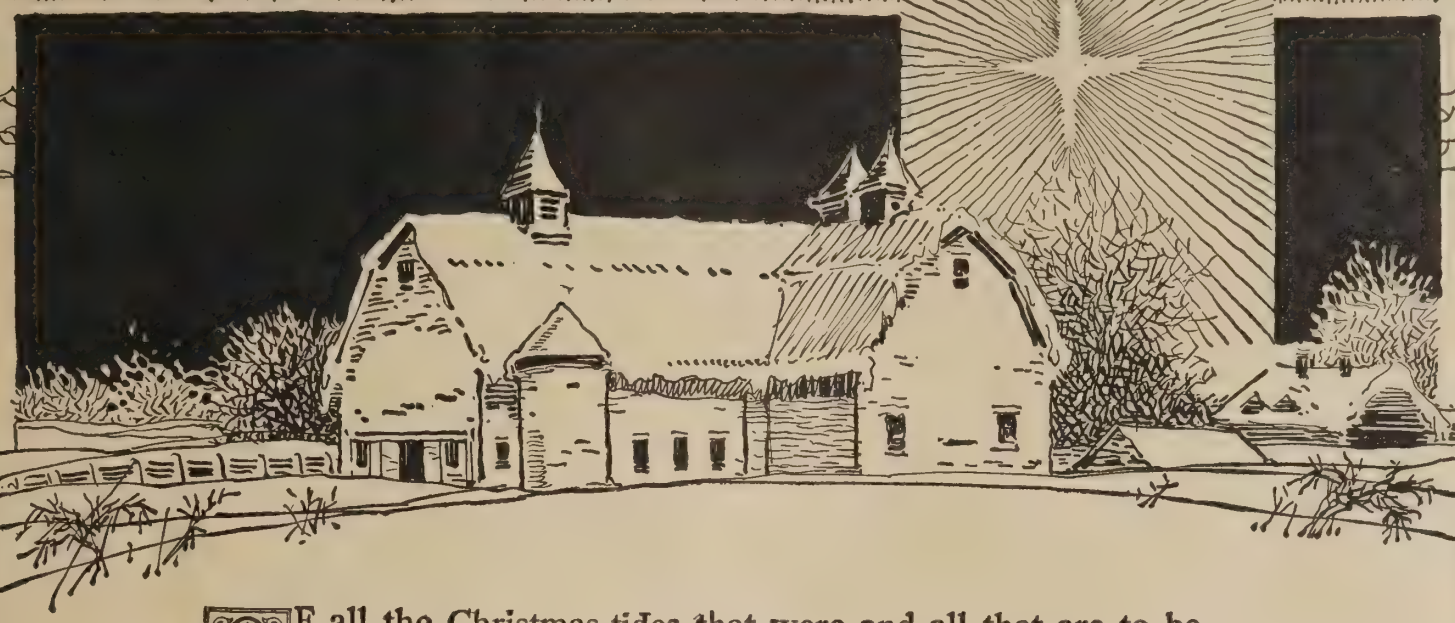
DE LAVAL

CREAM SEPARATORS

Save Cream, Time and Labo

Save Cream: If you are trying to ge along without a crea separator, or are using an inferior or half-wor out machine, with butter at 60 to 70 cents pound, a De Laval would soon save enoug cream to pay for itself.

Save Labor: A good cream separat is a big time and labo saver. And this year, more than ever befor time saving and labor saving on the farm mea money saving.



There is no other cream separator that ca compare with the De Laval in clean skimmin capacity, ease of operation, freedom from r pairs, and in durability.

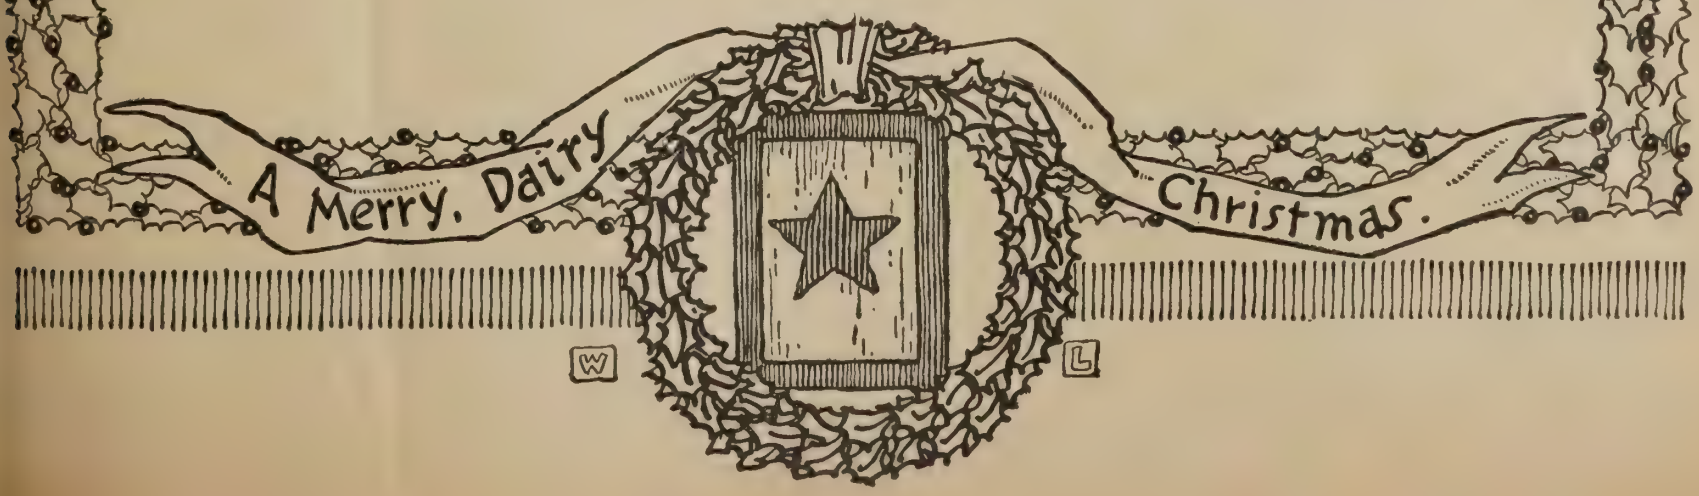
Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

The De Laval Separator Co

165 Broadway, New York. 29 E. Madison St., Chicago.

TWO CHRISTMAS STARS

OF all the Christmas-tides that were and all that are to be,
This Yuletide brings a greater joy—a sweeter sympathy.
The world will look on it as such—the holiest of days;
A landmark, down the aisle of time, in many magic ways.
For it is doubly fine and fair, and doubly rich in song,
And stars of Heaven blaze its trail the snow-white miles along.



Above the home cot and the barn, the silo and the sheds,
God's twinkling children of the night shine in their fleecy beds.
The fields that once were plumed with grain, lie radiant and still.
And pasture lands, as white as ghosts, beneath the moonbeams thrill.
It is a pretty scene—and pure—an etching on the snows;
A canvas holy hands have wrought from every wind that blows.

The farm is beautiful in June—when there is bee and bloom,
But fairer still, I always think, when caught on winter's loom—
When lights in windows, glimmer red—when boughs are crystaline;
When wreaths of holly smile at you and spruce has scent and sheen—
When, as you listen at the door, youth, from the world apart
Is writing songs of happiness that echo in its heart.

High in the arch of Heaven's grey one star supremely shines,
Its dim trail lost on mountain peak; in fir and upland pines.
A star that takes you back, to-night, to mangers, dim, serene,
The star that wise men of all years, for centuries have seen.
A sacred star—a holy star, a star, high-hanging there,
That brings the lips and souls of us to consecrated prayer.

Another star! The one that shines against the window pane!
The service star of one who went—but back with us again.
We fold him in our eager arms! Joy is so kin with grief,
And happiness so close to tears, in our heart-tuned relief
That, somehow, none of it seems real—Twice over do we pray,
That God's star and the boy we love have come this Christmas day!

—*W. Livingston Larned*

WAR-ROUND TABLE-RECONSTRUCTION

MILO D. CAMPBELL

MILO D. CAMPBELL

THESE are big words with big meanings. Undoubtedly before this communication is in print, guns and swords will have quit their part in this, the most awful of the world's tragedies. Then will come the Round Table, to be followed by reconstruction. In the first act of this bloody drama, boys and men from the soil have been found in every trench and going over the top in every victory achieved by our armies. No vocation or calling has furnished a greater proportion of its youth and manhood for the battle line and posts of danger than that of agriculture.

At the Round Table will be statesmen of all nations. From that table will come a new Ark of the Covenant, a new Magna Charta of human liberty that will assure to the world both individual and international justice.

Reconstruction

At the Round Table the farmer will not be in direct evidence, though fairly represented. Questions there considered will not especially concern him more than men of other industries.

But already in the red dawn of reconstruction, we can see the wonderful changes that are imminent in almost every line of industry. This period will be one of intensive contest, but not with guns. It will be one of wits, of politics, and of industrial advantage. It was partly because of this coming change that milk producers, who are furnishing one-fifth of the food of the nation, saw the necessity of preparedness.

As a nation we do not believe in radical socialism or in over paternalism. We are willing to allow the battle of wits and of individual accomplishment a chance to prove their merits. But this war has taught the people a lot of new tricks. First, it has taught them that organization of industries, of armies, of force in every direction is necessary. It has taught them the futility of anti-trust laws. The farmer had found this out long ago; for he knew that the big fellows, through gentlemen's agreements, consolidation, and by devious other methods, were escaping and that none of them had ever served a day in jail for their sins.

Before the war the International Harvester Company was compelled to divide up its business into separate companies. Now it is again a consolidated company, without objection of the government. The law has not been changed.

Milk producers are the only people who have been molested in the United States for claimed violation of anti-trust laws since the war began. These laws were not invoked by the federal government, but by city politicians. They were used as a cudgel to intimidate farmers who were producing milk at much less than cost, and who had the temerity to ask their reasonable cost of production. This war will burn a whole lot of dross out of our laws and from the business methods of the country.

Regulation will take the place of anti-trust laws, whether we like it or not. This lesson of governmental power in war will surely find expression in peace.

The consumers of the farmer's produce, when prices are high, will not inquire whether such price is caused by drouth, pestilence, scarcity of labor, or other actual cause; they will demand regulation of price and lowering of cost. This is all in the reconstruction future and must be met, either with docile submission on the part of the farmer or preparedness to meet the change.

If we as farmers expect to secure a standing, to maintain a semblance of dignity among the essential industries of the country after the war, we must organize for the purpose. Not to become a political party, not to become obstructionists, not to destroy, but to insist that we have some rights in fixing the price of the products of our labor. It is because of this necessity that the National Milk Producers' Federation came into existence. With its hundreds of thousands of members, it has already accomplished much, but its work is yet in its infancy.

What It Has Accomplished

When the National Milk Producers' Federation was incorporated under the laws of Illinois, it was organized to serve producers of milk. It was purely voluntary and is without profit or capital stock,—just an association for mutual help. Its work has extended over about fourteen months of time since incorporation.

It now includes all the greater milk producers' associations of the country from the New England States to the Pacific,—California, Oregon, and Washington being the latest to join.

The first principle enunciated by the Federation was one that ought to have found universal favor, that of "cost plus a reasonable profit" to be fixed by the government (during the war). The Federation has since shown to the government, by collating the results of hundreds of cost investigations, what it taxes the farmer to produce milk.

Formulas have been worked out, so that under varying prices of feed and labor the average cost can be approximately found. There have been those who, for ulterior reasons, have argued that because the cost varies with different farms, therefore the formulas were not reliable. Such reasoning could be applied to every production of farm and manufacture. It is specious and unjust.

The Federation, through the associate organizations, has shown to the farmers themselves what it costs them to produce milk, and has brought them to realize its proper place among farm productions. Heretofore milk production has been a parasite living upon other farm productions. The farmer himself was not aware of it. It has been instrumental in teaching the consuming public the real value of milk in the diet of the world. It has fought the city politicians who were profiting upon city votes by prosecuting and persecuting farmers, and has secured from the honest press of the country a proper recognition of the farmers' position.

It has obtained for the milk producer better prices for his milk, though not one-tenth of the milk produced in the country is yet sold for enough to cover its cost of production.

It has accomplished yet more for the nation than for producers in preserving the herds of the country. It is now known that the race would wither, if not perish, without milk and milk products. It is also known that milk at the highest prices known to any city is yet the cheapest food to be had. Knowledge by the farmer of what it costs him to produce milk is not dangerous, except to the profiteer who has been reveling in ill-gotten gains.

Ignorance of production cost kept the farmer producing milk at a loss. He used the labor of his wife, children, and hired help before and after regular work hours and no account of this labor was ever taken. Now we are asked to preserve scraps, to eat but half an ounce of butter at a meal, to conserve in everything, and the farmer has found that scraps of labor are worth something.

These are but some of the accomplishments in a short year of the Federation's work.

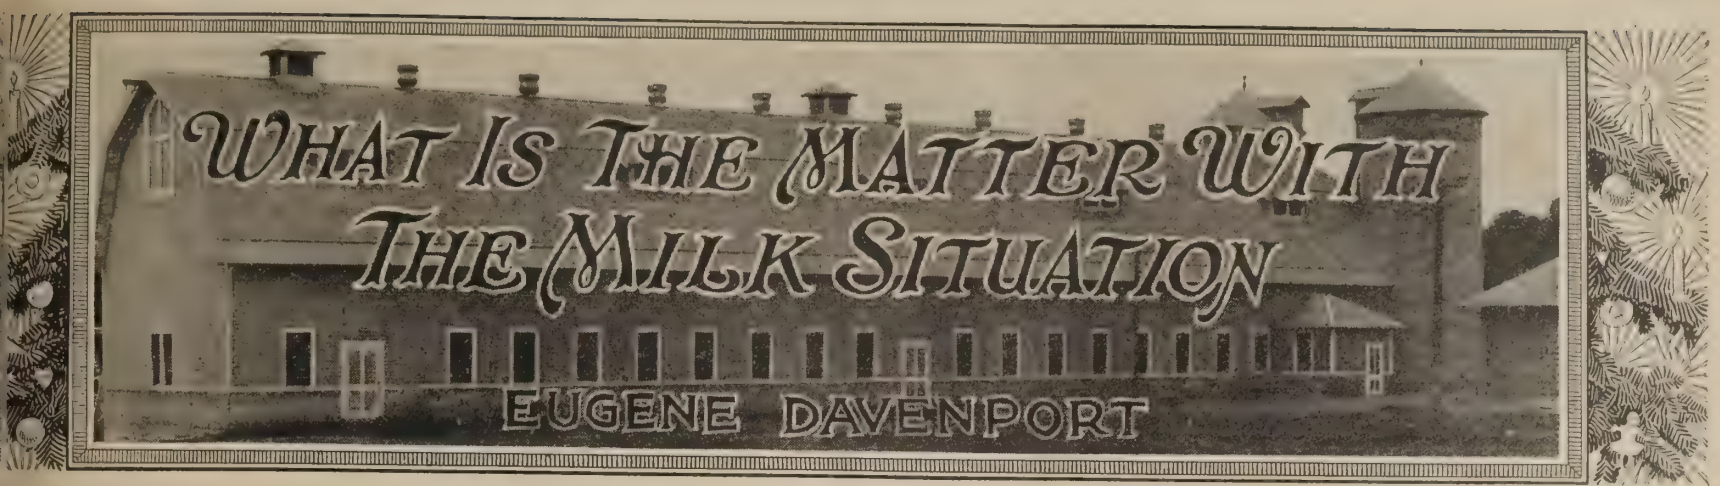
The Unorganized Field

There is yet great work for the Federation in fields outside of city zones, and much inside. During the war, we were pledged to "Carry On" every war measure, to be loyal in every action, and do nothing that could be construed by the most critical as unpatriotic.

Our greatest difficulty is in making those having charge of our business understand its nature. They look a quart bottle of milk that has them fourteen to sixteen cents compare the price with some ye ago, and use colored words aga the farmer.

In the first place, the whole incre is charged to the farmer, while matter of fact he has received for quart but 6 or 8 cents, delivered at station. No thought is had of price of grain fed to the cow, of lage, hay, forage, of labor that more than doubled in cost, of cows that become useless through ease or accident, of the worthless that have been raised to maturity a hundred items of expense that to the dairyman, of the slaver creates for the men and women care for the cows and their milk.

This education has not yet been parted to those in charge of our prices. There are no farmers, know these up-hill conditions, sit in the conferences. The men who



THE END OF A PERFECT DAY

poisoning the minds of the far court are men who are either p ing upon the low prices or are i ested wholly in consumers. This of government must yet have a tion. Unfortunately, neither the tional Milk Producers' Federatio any other association of milk pr ers has had men within its nu who were able to go to Washi and sit in the Food Administr for one dollar per year. They not board at a grocery and sleep garret in Washington for less $800 a year. Manufacturers of products, representatives of b cheese, and condensed milk man turers have been sitting there.

Naturally, only the personal ests of these men have been u most in their thoughts. They been limited in their profits, but er below cost of production. A the price paid them has been suff to cover the price paid to the f for milk and all other costs. schedule of these costs have

(Continued on page 760)

NE DAVENPORT

WHEN the farmer asks this question, he means "Why is the price of market milk such as to barely return the cost of feed and incidental expenses?" When the consumer asks it he means, "Why is the price double of a few years ago?" There is a in both questions, and both in- certain facts that ought to be generally understood.

The Farmer's Side

the farmer's side, as bearing the unusual cost of production, o be counted the early frost of ear cutting the corn crop, and rought of the present summer, greatly shortening the feed sup- hich is usually produced upon rm. To these facts must be add- e lessened amount of mill feed o our reduced consumption and gh milling percentage of wheat. f these incidents have resulted ably in greatly increasing the f production; yet the facts are enerally known, nor is their in- e properly appreciated by the mer.

scarcity of labor and its in- d cost have made themselves ot only directly in the expense ed to the making of milk day by ut also indirectly in the cost of grown feed, the greater outlay achinery, and the general ex- s of operation. This phase of ituation is scarcely appreciated e city consumers, even by the active of those who are engaged ll further increasing the pay of and reducing the hours of work. theless, these facts all appear accounting and the results will r or later, in one way or anoth- rn up in the milk bill.

demoralization of transporta- ast winter, due to war conditions, ed in filling to overflowing the of condensed milk which is the absorber of the surplus city Without a free market for this is, prices are bound to be demor- as the excess supply of market is forced into the channels of production, entailing inevitable

sely akin to the above in its ef- upon price is the reduction in mption which invariably fol- a rise in retail price, amounting to as much as twenty per cent. reduction is due not so much to ity to pay the increased price as sentment against what the con- believes to be a virtual con- y on the part of the dairyman he distributor to fleece the pub- exacting a fictitious and un- nted price for one of the essen- of life, particularly for babies nvalids.

wever incorrect this belief, it is none the less effective in rapidly making a bad matter worse for both producer and consumer—for the producer by cutting down the amount consumed and consequently the price; for the consumer in the long run because the dairyman is forced to so reduce production that by the time the public returns to its normal demand the supply is insufficient, sending the price upward. So does the consumer by reducing his consumption below the normal injure both the producer and himself.

There is no conspiracy. Of this fact let the consumer be assured, and every means possible should be taken to educate the public about all the facts that enter into the production and distribution of market milk. It is not so much that everybody will remember all of them but rather that, with a widespread understanding that there is nothing to be concealed, the opposition will die a natural death.

The Consumer's Side

In general the consumer does not appreciate the food value of milk but looks upon it instead as a kind of culinary necessity like salt or soda, nor does he realize the difficulties in its preparation and delivery. He underestimates the situation at four exceedingly important points:

First: He does not understand that milk is a standard article of diet and even at the highest price ever paid, it is yet the cheapest of all forms of animal food.

Second: He does not understand the special value of milk for its fat soluble vitamines, not only for children but doubtless for adults as well, especially when recovering from disease or in resisting those temporary periods of physical depression that so easily open the road to infection.

Third: He does not stop to consider that milk is an exceedingly perishable food that must be delivered fresh every day; that it is heavy, and that the container is both costly and breakable.

Fourth: He does not realize the need of special sanitary precautions in handling a food that serves as a successful culture media for every kind of disease germ that may chance to find access.

Back of all this problem lies the question: "Why does the consumer get so much more excited about what he regards as a high price for milk than he does about high prices for meat?" The obvious answer is that he does not realize that, considered from the standpoint of food values, milk is always cheaper than meat. Obvious and true though this may be, the larger element in the situation is doubtless psychological.

When the consumer pays a big price for a steak or a chop, all the family enjoy the feast, and even though smarting under the "extortion" they all agree that it is "worth the price". Not so when the price of milk goes up. For the most part milk is not consumed directly and by all members of the family. A few adults drink it regularly, but for the most part milk is consumed by children or it disappears in the cooking, and the adults, who pay the bills, are not conscious of special enjoyment or advantage in its consumption.

Speaking psychologically therefore, and from the standpoint of those who pay the bills, milk wastes itself by merging its benefits into the general family welfare. *Pater familias* will storm about "extortion" and "conspiracy" even when smoking a cigar that costs him more than ever before, though no delicate problems of sanitation and daily delivery are involved in its production, no member of the family but himself is benefitted in its consumption, and nothing that is essential to good health or effective living is concerned. Psychologically, our friend, the milk, does not stand a ghost of a chance in the rising market as against "My Lady Nicotine".

There are various phases of the milk business connected with delivery that are not understood by the consumer and that operate powerfully to stiffen resistance to what is regarded as extortion and against which the consumer uses no defense but reduced consumption.

For example, many of those who buy milk by the pint cannot understand why a pint of milk should cost more than half as much as a quart, and yet when the fact is pointed out, it is easy to see that the expense of bottling and distributing is practically the same for a pint as for a quart. If the unit of sale were the pint, then the buyers of quarts would be pleased, for they would regard the difference as a reduction in their favor. But now that milk is sold by the quart, everything is standardized around this amount, which is too large for many consumers. It is inevitable that they should regard the difference as an imposition, whereas the fact is that if dealers sold only pints at prevailing prices, they would speedily go out of business; in other words, they get no credit for what is in reality a discrimination in favor of the small consumer.

In general the consumer lays his troubles at the door of the dealer whose agent he sees every day, rather than upon the farmer who is a somewhat hazy creature existing somewhere back in the nimbus of his consciousness. If he ever gets into the matter, his worst suspicions are confirmed when he learns that the distributor gets about as much for bottling and delivery as the farmer does for production. "What! The farmer raises the feed, stables and milks the cows, hauls the product to the plant, and then the dealer gets as much and sometimes more for putting it into bottles and delivering it to the back doors!" His wrath is kindled against the dealer and he feeds the fires of his indignation until he reads one day of a milk strike by the farmers. Soon after, milk goes up again. "Could evidence of conspiracy and extortion be more complete?" So he reduces his milk order in a blind determination to smoke out both of them. As he nurses his righteous resentment, the consumer does not know and nobody tells him of the expenses, the trouble, and the losses of the distributor.

For example, he does not know nor stop to think, and nobody tells him, that milk bottles are costly, and that every one of them must be gathered up every day from the back door of the customer, carried back to the factory, and sterilized in an oven with live steam. He does not know that the breakage is extreme and that there exists a regular organized business of stealing bottles and selling them to the junk man, not to mention their

[Continued on page 738]

WOMEN HELPED IN WAR-TIME DAIRYING

To the farm woman the city milk consumer owes much, for if she had not gallantly entered the breach left when the boys went to war the dairyman would have been compelled to further reduce his herd and there would have been a much more scanty milk supply for the cities. The milking machine helped to increase her efficiency, and it is interesting to know that this illustration shows the interior of a Minnesota barn on the farm of L. K. Frederickson.

CO-OPERATIVE BULL ASSOCIATIONS

JOEL G. WINKJER

J. G. WINKJER

"DEWITT is my name. My neighbors, when they get chummy, call me Do-it. I came over this morning for some information on a problem I have in running my farm. I have seen that much information is given out by the government, and when I came here and asked for information regarding the purchase of a pure-bred bull for my dairy herd, I was directed to you."

"Glad to meet you, Mr. Dewitt. Do-it is my middle name; therefore I have no doubt we shall get along nicely. Have a chair. How much of a farm have you, Mr. Dewitt, and what is your line of farming?"

"Well, now, let me tell you my story. I lived in the city, but quit my job, sold the house I owned, and bought a hundred-acre farm near the same place Tom Moore is from. You know Tom, don't you?"

"Yes, know him well."

"I have gone into farming, and from my reading I came to the conclusion that in order to do general farming successfully it was necessary to include dairying. I started with two cows, and now have six. It is my plan to have ten or a dozen. I am now considering the purchase of a pure-bred bull and have come for advice. You see, up to this time I have used my neighbor's bulls. The first two years I went over to Bellew's Creek District for one. Almost five miles over there, and at that it was only a scrub bull. The next year I went across the hill to Dick George's Guernsey bull. He was nearer, and Dick had been told it was a thoroughbred. Dick could not use him any longer because he did not want to inbreed, and besides the bull showed signs of being ugly; and he was not going to get another one."

"Now, lately, a neighbor about two miles off has let me use his grade Holstein. This bull also showed signs of getting ugly and he sold him to the butcher. My cows are all grade cows. I would like to know if it would pay me to buy a pure-bred bull, and what can I buy one for?"

"These are puzzling questions, Mr. Dewitt. I know pure-bred bulls to have been given away, and there is also record of one being sold for $106,000. It is not uncommon to hear of bulls selling for $10,000."

"Ten thousand dollars! Why, my whole farm is not worth that much. If I bought one for that price I would have to sell my farm to raise the money, and I would have no farm to keep my bull on. I have no doubt I could raise such a bull, and also use the money that it sells for, but just now I have only about $175 or $200 that I might put into a pure-bred bull if it is good business to do so."

"You say you have $200 to invest in a pure-bred bull. Now let us see what that means in your case. In addition to your first investment comes the cost of keep. What will it cost you to properly feed and care for a bull a year?"

"According to prevailing prices I could not do that for any less than $75 a year."

"You can keep your bull two years, then you have to dispose of him and buy another bull. That means that the cost of the bull and care for two years amounts to $350. The money you get for your bull when you sell him at the end of two years must be subtracted from this. The question is, what will your bull sell for at the end of two years? If you have kept yearly production records of your cows you will be in position to tell, when you get a similar record of the daughters, if your bull is any good. But here is the rub, it will take two years more before you can know the daughters' yearly production. It costs you $75 a year to keep a bull, so it is out of the question for you to keep him more than two years. You will have to sell him and the one who buys the bull doesn't know any more about him than you do, so the chances are you sell him for beef prices. He may be worth more than a thousand dollars but no one knows, and so it happens over and over again that you hear some dairy farmer refer to the good bull he once had, but when he tried to get him back he found the bull had been butchered. We are, therefore, up against the proposition of selling the bull for beef prices. What do you think he will sell for, Mr. Dewitt?"

"About $125."

"It has already cost you $350 to provide bull service. You get $125 out of this investment so your net outlay for two years' pure-bred bull service is $225, $112.50 per year, or $18.75 for each cow. It looks now as if neighbor Dick had some other reason than that bulls became ugly for not keeping another one. Yes, Mr. Dewitt, the farmer with a small herd has quite a big handicap placed on him. It would be quite different if you had sixty cows. The cost would then be only one-tenth, or $1.87 for each cow."

"Yes, but I do not have sixty cows, and, what is more, have no possible chance of getting that many."

"From what you say there are some neighbors of yours that have cows, possibly as many as sixty cows could be found among your neighbors. If those neighbors would agree to use one bull, pay their share in the purchase, and later the keep, you would then be about on the same basis as if you had sixty cows of your own."

"That is what you call a co-operative bull association, is it? I have heard of that kind of an organization."

"No, Mr. Dewitt, that is not a co-operative bull association. It is only a part of one. It requires at least two other such blocks. You see, we call each of those parts of an association a 'block'. Before you get a co-operative bull association with its benefits, you must have three of these blocks and it is better if you can have five or six blocks."

"I do not suppose we can form such an association in our county but I would like to know more about them. I have found that I cannot ask too many questions regarding farming, even if it does not seem at first to be of any use to me. In order for us to form an association we would have to get Bellew's Creek neighborhood buy a bull and a neighborhood some other place to buy another, then we would have a co-opera bull association, is that the idea?"

"Yes, and no; in a general way have the idea but there must be an organization according to that have been used in the most cessful associations. Unless you it right in all respects you may in the same fix as a man who ha four wheels on his wagon but no to hold on the wheels; when he s to drive, the wheels go each in d ent directions, according to the they get into, and then there is ble. Unless the organization is right the chances are that some will go wrong.

"Experience has shown that tr arises if each block buys its own To avoid this trouble the associ is first organized, a director is s ed from each block, and thes rectors together transact the ness of the association. One of first duties is to buy bulls for a blocks of the association. You readily see the reason for this w tell you that the bulls are kept block two years and then each into the next block where the again kept two years. This is re ed as many times as there are in the association until all have, at some time, used all bulls. It is, therefore, nece that these bulls be of the same breeding and as nearly as po equal in value."

"You said that the bull changed from one block to a every two years. Does that mea I get the use of another bull aft years without additional cost?"

"Yes, that is exactly wh means."

"Then is it also right that have four bulls—four blocks— have the use of a good, pure-bre for eight years without payin more than the first payment a keep of the bull after that?"

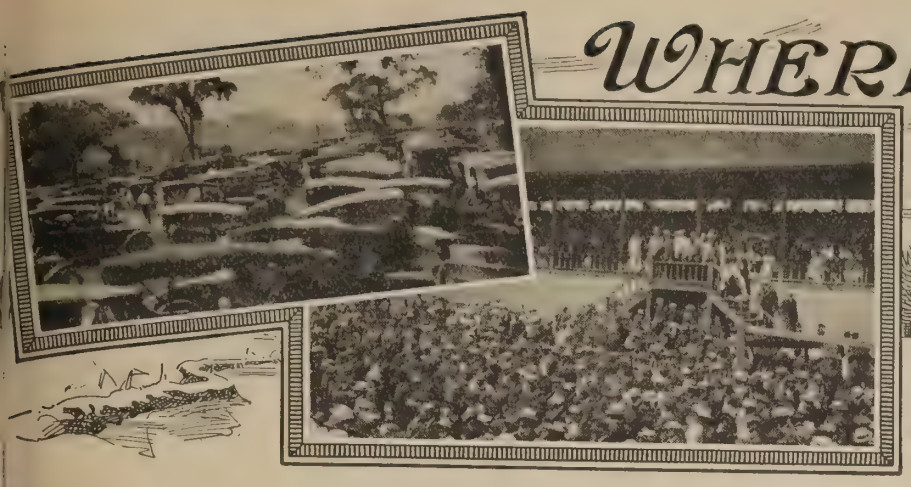
"Yes, your part of the keep bull."

"Then the following figure right. Sixty cows in a block $200 bull for that block mean $3.33⅓ per cow has to be p have six cows and $20 would share."

"Yes, if you have sixty cow block. If you have less than cows, of course the amount p would be higher. The average ber of cows per block in all the ations in the United States is eight. You would have to add the cost of keep of the bull. much do you think that would Dewitt?"

"Why not charge the same did in the first place, $75 per y

"That is fair, $1.25 per cow sixty cows in your block. The



(Continued on page 744)

THE RESULTS OF A GOOD BULL

Six daughters of this bull each produced in one year 1,695 lbs. more milk and 93 lbs. more fat than their dams.

Through the co-operative bull association the services of a good bull are made available for many years.

WHERE SHALL WE GO FROM HERE?

E. R. EASTMAN

HERE is an old Dairymen's League story about two frogs. One was an optimist, and the er a pessimist. In the course of a , both fell in a pan of cream. The simist cried, "It's all over, it's all r," and immediately turned over l gave up the ghost. But the opti- stic frog cried, "Where there's life re's hope, where there's life there's e," and began kicking so vigorously h both legs in co-operation that he n churned the cream into butter l, climbing on the butter, hopped of the pan.

For fifty years and longer the farm- of America have been in a pan of am. The last two or three years we e shown some tendency to hop out means of co-operative organi- ions, and I am optimistic enough to ieve that we are going to succeed; we are by no means out yet, and re is grave danger that the pessi- ts will not drown before they dis- rage all the rest of us.

We as farmers stand today at the atest crisis and at the same time h the greatest opportunity in the tory of agriculture. We have found machinery that, if properly used, l make us equal to our opportunity, that will determine not only the ure happiness and the prosperity of ners, but of all other classes as , for agricultural success is fun- ental in the end to all other happi- s.

ur machinery is our organization. ing the war farm co-operative anizations, large and small, have ng up by the hundreds all over country. So far they have been essful. They have given us better es for our products, they have red for agriculture some recog- nition, and above all they have given us some confidence in one another and in our leaders, which is fundamental to any united action.

Will We Get Our "Second Wind"?

But are these organizations here to stay? So far, enthusiasm at their start has carried them along and enabled them to secure their first successes. These successes have been easy to see, it has been easy to secure new members, and older ones have had little to grumble about. But we are through with this first period of easy sailing, and have entered the period of readjustment when we must learn that true co-operation means the supression of too strong individual notions, forbearance of the other partner's faults, and real self-sacrifice. We have arrived at the time when we have stopped to get our "second wind" in learning to give the long pull and strong pull together. We have the machinery for obtaining for agriculture and for farmers the recognition in the political, economic, and social life of the nation. But the machinery is still very crude and we have not yet learned to operate it.

Any individual or organization can succeed when all goes well. Anyone can be a fair weather friend. Can we as farmers remain active, loyal supporters of our co-operative organizations in the downs as well as in the ups? Can we stick together through thick and thin? Can we learn that there can never be something for nothing and that, if our organizations are to succeed, there must be personal service and sacrifice? These are the questions that we must answer in the affirmative and if so answered the future of farming in America is assured.

PRIMITIVE EQUIPMENT, BUT THEY CARRIED ON

During the milk strikes of some two years ago, farmers and farmers' wives gave evidence that they would stick to their organization through bad weather as well as through fair weather. When the call came to keep their milk at home, many a dairyman got out the equipment of other days and sought to make the best use of the milk on his own farm that heretofore he had shipped to the city. He showed that he was loyal to his brother dairymen even though it meant the temporary loss of profit and considerable inconvenience. Another interpretation of this illustration would be the concluding paragraph of Mr. Eastman's article in which he says: "Where shall we go from here? We shall go right on doing business on the same good old place, but not in the same bad old way."

Although farm organizations are young we know from experience certain principles that must be followed if we are to succeed. A few of these principles, taken mostly from the actual experience of the Dairymen's League and other co-operative organizations, are briefly outlined in this article.

What Organization Has Done for Labor

What has happened to labor in the last four years? Compare the average wage now and a few years ago. Is not the workmen's dream of an eight-hour day a fact? Look at the new laws on the statute books in favor of labor. What happened? Organization. When Samuel Gompers goes to Washington, is he received and does he get what he goes after because he is Gompers, the individual, or is it because as president of the American Federation of Labor he has 2,000,000 men as a unit back of him? There are 30,000,000 farmers in America, but what do we get at Washington or anywhere else? We get what we deserve for not getting together.

It is not enough to merely join an organization, and then sit back and find fault because the millenium is not immediately brought to pass. There must not only be membership but it must be active, paying its dues toward the support of its organization and rendering personal service to make it a success. It seems hard to believe, but there is quite a large class of farmers who refuse to join an organization or, if they have joined, refuse to pay dues because they can get the benefits without paying, benefits that others have earned for them. What shall we do with these slackers?

There are others who refuse to render any personal service to help along the local organization, and thus aid their own public business. They expect a few officers to do it all but are the first to find fault. They expect something for nothing.

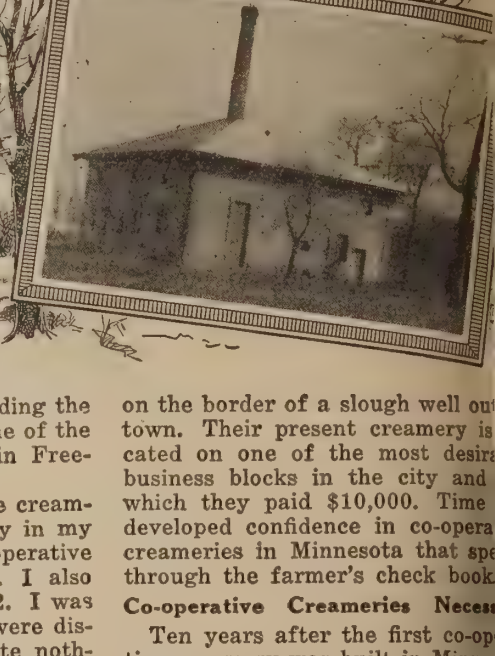
Farmers could obtain justice and respect—we want nothing more—if we could only lay aside some of our narrowness, some of our individualism, organize every community solidly with real members, join those communities in large democratic associations, and then federate all the different associations in the country. Suppose we had a president of a farmers' federation representing 5,000,000 organized farmers, and this president should say to Mr. Hoover or to Congress that a certain policy could not be accepted by the American farmers. What would happen to the policy?

Who is Running Your Public Business?

To be successful, organization must be built and run from the bottom up, not from the top down. Local action and initiative are essential, and this local action should be definite in form to serve as a guide for the leaders. The only way for farmers to get local action is through meetings, yet a majority of farmers will not attend meetings. Of course, there is some excuse, for farmers are busy at home and there is always work to do and evenings after work men are too tired to drive several miles to a meeting, yet, what is the use of doing the work at home if you are not paid for it? We have stayed home so long and let the other fellow run our public business that he has blame near run it in the ground so far as we are concerned. Farming is a two-sided business, consisting of production and marketing. To attend to the marketing side, organization is necessary, and organization isn't any good without frequent, well attended farm meetings.

But speaking frankly, the average farm meeting is a joke. Our meetings are not well advertised so that only a few know about it. A few of us meet and maybe an hour after starting time we attempt to do a little business. Many times the meeting is not even called to formal order; the officers assume no leadership and the minutes are not kept or read. There is no parliamentary procedure. Subjects are discussed that have no bearing on the business in hand, and we adjourn without coming to any definite conclusions. Incidentally many of us do not go again, for the meeting was a waste of time. There should have been a regular program of business, each topic handled in a business-like manner and definitely disposed of. The results that concerned the parent organization should be immediately forwarded to it. How many times have I attended a local meeting and found that the secretary either was not there at all, or had forgotten all of his papers that should have received attention at the meeting. Think of this happening in a Board of Commerce meeting in a city! I predict that as long as we farmers will not try to run our public affairs with some degree of business methods, some other class will run them for us, and to our detriment.

Leaders Do Not Lead



Then there is that important question of leadership. One of the hardest problems of farm organization is to get both local and general leaders, men with ability, experience, and public spirit. There are men in every community who want to be leaders who should not be, and those who should be, who are not anxious for the job. We are making progress, for more and more the good men in the community are coming to realize that they must show some public spirit and sacrifice for the common cause.

It has also been difficult to get general leaders because there are few men with farm experience and point of view, who have business experience enough to run a great co-operative movement; but we are getting a few such leaders, for the experience has now been acquired at the cost, naturally, of some mistakes. We are gaining in the number and quality of our leadership, but we as farmers have still to learn that a "laborer is worthy of his hire." A large salary looks especially big to farmers because their

CO-OPERATIVE CREAMERIES of MINNESOTA

A. J. McGUIRE

A. J. McGUIRE

I WAS much pleased a month ago to receive an invitation from Hoard's Dairyman to write an account of the co-operative creameries of Minnesota. I was pleased for two reasons: First, because I believe the co-operative creameries of Minnesota are working out the future,—not only a better business farming, but of better citizenship. To give an account of this is surely a pleasant task. I was pleased for a second reason because I regard Hoard's Dairyman as "the voice of one crying in the wilderness: 'prepare ye the way, make straight the path'" for better dairying, for better farming, and for better living. Hoard's Dairyman has led to more profitable dairying and I cannot help but associate greater profits with not only better living but right living. To live right in these times a farmer needs to make money. Poverty is no longer a virtue.

By Their Fruits Ye Shall Know Them

Co-operative creameries have been in operation in Minnesota for 28 years. There are 643 in the state. They have been given the test of time and of number and they are more successful and prosperous and profitable today than they have been at any time in their past history, and they have always been successful.

Minnesota may pass judgment on the usefulness and the success of the co-operative creamery system. The co-operative creameries are scattered throughout the state and are operated under a great variety of conditions and in comparison with other systems that are not co-operative.

The Test of Time

The first co-operative creamery organized in Minnesota was the Clark's Grove Co-operative Creamery in Freeborn County. It was built in 1890. Last year, or 1917, this creamery took in 264,540 lbs. of butterfat for which it paid its patrons a net price of 50.45 cents. The average price of butter for 1917 (New York extras) was 43.55 cents. This creamery paid its patrons an average price of 6.9 cents above New York's extras for the year. I visited this creamery to make a study of co-operation in 1902 and found them paying a little below New York extras or, to be exact, in the year 1901 they paid an average net price of 21.31 cents. The price of New York extras for that year was 21.50 cents. Note the improvement in 16 years. Not the difference in price but the difference of what they paid in comparison with New York extras. In 1917 they paid their patrons $23,644.06 above New York extras on their total business. That co-operative creamery is standing the test of time, and it is only one of the 26 co-operative creameries in Freeborn County.

I have another co-operative creamery that stands out distinctly in my mind—the Farmers' Co-operative Creamery at Waseca, Minn. I also visited this creamery in 1902. I was looking for creameries that were distinctly successful but I wrote nothing about the Waseca creamery. It was but as a private in the rear rank (important but not noticeable). This past year that association built a new creamery (their third) that expresses the new era in co-operation. They put $43,000 into their new creamery; a price undreamed of, impossible in the early years of co-operation. Their first creamery with its equipment cost $3,000. Their present creamery with its equipment cost $33,000. Their first creamery was built down on the border of a slough well out town. Their present creamery is cated on one of the most desira business blocks in the city and which they paid $10,000. Time developed confidence in co-opera creameries in Minnesota that spe through the farmer's check book.

REAR VIEW OF FARMERS' CO-OPERATIVE CREAMERY AT WASECA, MINNESOTA

This creamery has two delivery platforms. The patrons of this creamery deliver their cream as is practiced by nearly all Minnesota co-operative creameries.

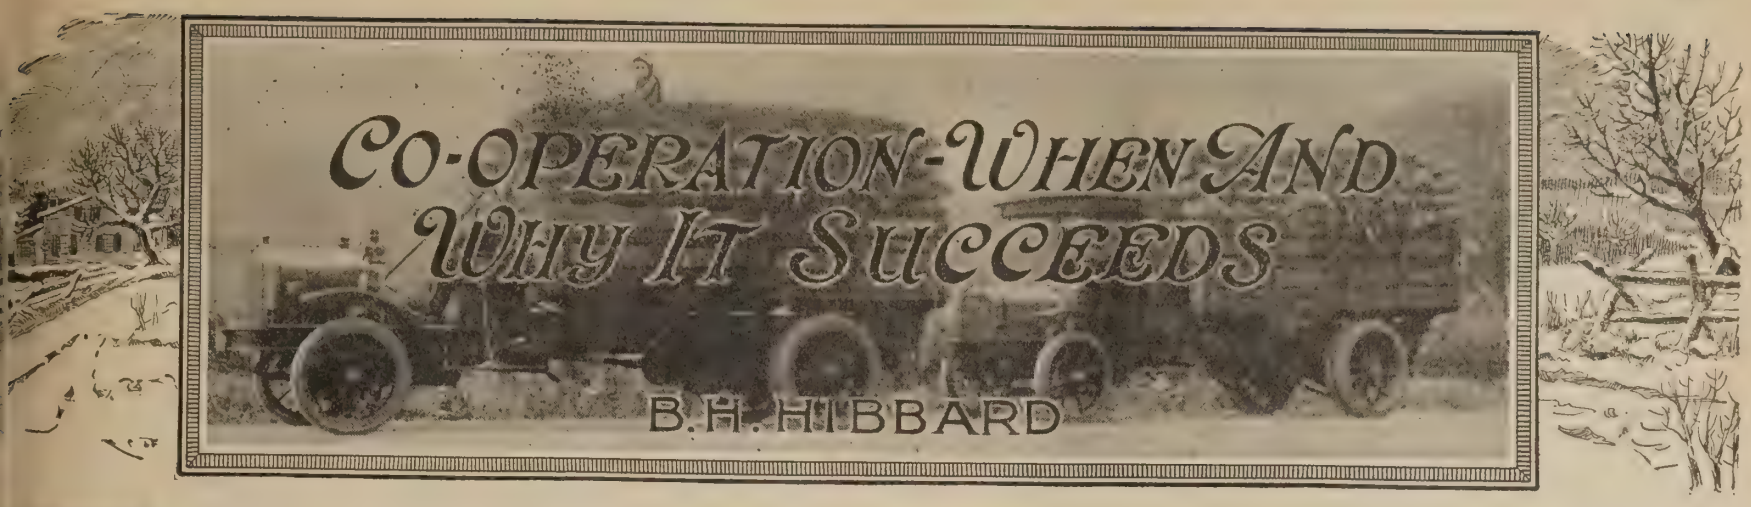
FARMERS' CO-OPERATIVE CREAMERY AT MILACA, MINNESOTA

This creamery has the largest business of any co-operative creamery in Minnesota. In 1917 it took in 653,635 pounds of butterfat. Fifteen years ago land around Milaca could be had for a song. The sawmill had just moved out and the town was supposed to be dead. The business men got together and moved the saloons out and invited dairy farmers in. Today there is more butterfat produced per square mile around Milaca than in any other section of the United States. There are five other co-operative creameries within a radius of six miles of Milaca. (And some of them will not be rated second to Milaca except in amount of business.) The largest and most successful co-operative dairy bull association in the United States is also in this community.

Co-operative Creameries Neces

Ten years after the first co-op tive creamery was built in Minne there were 500 in operation in state. They were built fast bec they were necessary. Before the operative creameries, the Minne farmers had no dairy market was worth mentioning. They b creameries in co-operation in early years, not because they beli the co-operative creamery sys best, but because there was no o system that would provide a mar They grasped co-operation out of cessity, but after 28 years the and file of Minnesota dairy far still hold that the co-operative cre ery system is necessary—absolu necessary, and not only necessary by all means best.

Twenty-eight years ago Minne farmers found co-operative crea ies necessary to get their butte the world's best market. Today believe their co-operative cream necessary to keep their butter t



Minnesota has built up its ma through the quality of butter duced and it is the co-operative cr ery system of the state that has the high quality of the butter p ble. Minnesota through her co-o tive creameries lays claim to ma the best butter in the world and proof of this is in the fact that ter made in Minnesota co-oper creameries has won first place i of the 17 national butter contes

The co-operative creamery sy gives to every community where is a sufficient number of cows, means of having its butter in th and in a refrigerator car on the to the consumer the day after the terfat has been produced by the In this system lies quality—pure, flavored butter for which there substitute in the world. Whe dairy farmer loses sight of this ty he forgets the very foundati his business. People can get without poor butter, but they wi get along without good butter wh is possible for them to have it. co-operative creamery is necessa insure the production of good bu

Co-operation Works

"The farmers won't work toge is an expression of the ignorant lie manufactured to discourage The farmers can work together operation. Co-operation is wo and must be extended to all prod in all industries if "democracy is safe". While the common peopl fuse to work together there wi ways be some tyrant waiting to them. The co-operative creameri Minnesota have done more to co-operation—to teach democra you please (rule of the majorit the good of all)—than the highe stitution of learning in the land

(Continued on page 754)

B. H. HIBBARD

IT is easy to get testimony either for or against any plan of operation that has been tried by so many people, over so long a period of time, and under so many circumstances. For those who believe, or who wish to believe, that co-operation is a failure, the testimony abundant. For those who be- e it a success the testimony likewise abundant. During the ; forty-five years there have n started a great number of perative companies which have n ready for the undertaker soon r birth. But the trouble was in t cases due to a bad presentation incongenial surroundings. There no reason to expect the mortality to be any lower than it actually

he troubles which brought these y efforts to such untimely and y ends were for the most part few umber and negative in character. t is to say, the failures were not ften due to the presence of some esirable quality as to the absence some desirable quality. In other ds, it was not so often disease as er-nourishment that caused the lities.

Must Be Born of Necessity

here are a few conditions that t substantially always be present o-operation is to succeed. One of first of these may be called the essity that something be done. ess there is a real occasion for a rm or a change of some impor- character, the organization of a perative company is not called This is only a matter of com- sense. If there is nothing to be ed, why take the trouble to main- an organization? It is a clear , that there must be something to lerived, some goal to be reached, o-operation will be of no use. To titute co-operation for the usual ods of doing business merely be- e some one, or a few, farmer ves in co-operation is far from . Sentiment of this kind may be helpful along with other facts conditions. It cannot of itself the interest alive and the ma- ery in operation. The tendency r trade to run into private chan- unless there is something positive ep it turned in another direction. is because there is the energy push of private initiative in the uit of gain on the part of a pri- enterprise which is wanting in a perative company where the re- l is small and where, moreover, it ared by many. There must then omething tangible in sight if co- ation is to prosper. A somewhat statement of the case is to the t that successful co-operation be born of necessity.

second consideration is that there must be business enough in prospect to warrant the undertaking. No matter how great may be the need of a better system of marketing, judged from the margin of loss on a given volume of business, this volume must in itself be great enough to furnish the basis of transactions such as to afford support for a new enterprise or it had best not be undertaken. The same rule applies to any business venture. There may be great loss due to lack of good facilities for marketing butter, but if the amount of butter produced be only half enough to enable a creamery to run economically there is no use in hoping that a co-operative creamery will be able to better the situation. It would serve only to transfer the loss from one account to another.

Simplicity, Leadership, Organization, and Management

Other fundamental conditions necessary to the success of co-operation may be mentioned without discussion.

A WISCONSIN CO-OPERATIVE FEED AND COAL WAREHOUSE

The success of a farmers' co-operative endeavor is largely dependent upon the necessity for its existence and the volume of business it can command. The demand for its being should come from the farmers themselves and their interest should be vital in it. Good leadership and proper organization are other essentials, but the heart of the whole matter is the character and ability of the manager.

The business must be of a simple character, permitting the farmer to participate in it without taking too much of his attention from his farm. It must, ordinarily, pertain to matters in which the farmer has a vital interest, thereby insuring intelligent support. There must be a spirit of co-operation within the men who undertake to co-operate, or failure is certain. A goodly measure of leadership is of prime importance. The desire for the organization should come from within the group, or at least it should not come from a promoter who advocates the project for the sake of gain. The promoter companies nearly all fail.

Closely in line with these prerequisites the company itself must be carefully organized. No business runs itself, much less a co-operative business. The loose, careless methods which may succeed in the case of a man who takes charge of his own affairs cannot be tolerated in connection with a co-operative company. This is true because the owners are at home taking care of their farms and seldom does any one of the farmers involved take a great amount of interest, so far as personal supervision is concerned, in the co-operative company of which he is a member. Hence, the businesslike nature of the company is of very great importance. Closely associated with the manner of doing business, and of even more consequence, is the character of the manager. Here, indeed, is the heart of the whole matter. With a first class manager all manner of faults in other matters may be overcome. With a poor manager, a company otherwise perfect may fail. The manager should be a man acquainted with the work to be done. He should be a man of experience. Having found such a man it will be necessary to pay him what he is worth. In the first instance this means what he can command in the market of competing private companies, or more likely a little more than a competing company will pay. The value of a manager should be reckoned on the basis of what he is worth to the company employing him, taking into account the gain from good service performed, rather than on the mere matter of what another company is willing to pay. When it is remembered that the members of a co-operative company really co-operate with the manager much more than among themselves, it is plain that hardly too much care can be taken in finding the right man and paying him enough to keep him satisfied and enthusiastic. He must want the company to succeed.

It has been evident for some time, but never so much as during the period of the war, that co-operation is the solution of many of the troubles of the farmer. On the other hand, there is no magic about co-operation. It is a means to an end and, properly used, a most effective means.

Collective Bargaining Demanded

When the neighborhood was self-sufficing and the most of the produce of the community was sold at the village store, each farmer was competent to sell his own goods. During a similar period each laborer could bargain for the sale of his own labor. But just as labor was long ago compelled to join forces in order to make a fair deal, so the farmers are learning that the individual is incapable of looking out alone for his interests. For example, in the sale of milk the individual can no longer argue his case with the city milk dealer. The dealer is too far away and is too independent to pay much attention to one consumer. It does not follow that the dealer is making too much money even though he may be buying milk at a very low price, since his competitors are likewise buying at too low a price. The whole level of the trade needs readjusting. This was the case in 1916 and 1917. But the different milk producers' associations were, at the opening of the struggle, powerless to cope with the issues because they did not include within their numbers a sufficiently large proportion of the farmers of the community to say what they would or would not do and live up to it.

The history of the struggle over milk prices during the past two and a half years has been full of interest, and leaves some facts and lessons clearly impressed. In the first place, it shows that unless the farmers contend for their rights, they will not get them. In the second place, it is just as clear that no group of farmers, no matter how well they may be organized, can hope to get much more than fair prices for produce. This is true because of the wide territory covered by farmers, their great numbers, and the willingness of many to work for a small profit. In the third place, it is clear that the way to succeed in the new field of effort is through collective bargaining. By this means a few representatives may voice the sentiments of the many who otherwise would never be heard. By this means the truths of the markets may be made known. This includes the truths on both sides. The representatives of the consumers may make plain the limitations as to the increase in prices, the demand side of the market. The producers may make clear the limitations of the lowering of prices, and show why a given price is necessary or a proposed price perhaps disastrous. Somewhere between the two extremes a bargain will be made.

Fallacies of Costs in Price Fixing

This method, it will be noticed, leaves little room for cost-accounting as a means of arriving at a price basis. The hearing on milk prices in Chicago a year ago should convince anyone short of a veritable crank that prices are not, and cannot be, directly made out of costs or cost accounts. Costs to begin with are extremely difficult to discover. They vary greatly from farm to farm. Should all the costs be known it would be entirely impossible to determine

Co-operation Solves Dairy Marketing Problems

MOGENS R. TOLSTRUP

M. R. TOLSTRUP

No matter what is said about co-operation, one will have to admit that whenever any really serious problems arise, co-operation is the one remedy which will surely and safely overcome the difficulty. The present world-wide war is proving this beyond a doubt. Germany tried to dominate the world and subject it to military power by hitherto unheard of brutality; but she failed because she run up against a united force, co-operating, and willing to give their all if need be, in order that equal rights and liberty may forever replace military force and autocracy as world standards.

At Middlebury, Vermont, there is a splendid example of how real co-operation can be used in the dairy industry in order to market the dairy products to best advantage. It is well worth while, to say the least, for those interested in the economic progress of agriculture to study the story of the Addison County Co-operative Dairy Company.

Early Conditions

For quite a number of years, the farmers in the vicinity of Middlebury had two outlets for their dairy products. A local creamery, co-operative in name but not in nature, stood ready to receive either milk or cream and make returns as best it might. A milk plant operated by a New York firm was located at the railroad siding and ready to buy all the milk it could get hold of. This milk was pasteurized and bottled before it was shipped to New York City for distribution. The prices paid farmers were announced in advance for definite periods. In this way, there was a chance for the farmers to choose whether to sell whole milk or cream and conditions were fairly satisfactory until one day last winter the milk company went into bankruptcy. The farmers patronizing the plant were informed that they would be without a market and that some $15,000 which the company owed them might not be paid.

Left Without a Market

This was not a pleasant situation for the patrons to be confronted with. In addition to the prospect of losing a few hundred dollars each, they were left practically without any market for their milk. The local creamery had also changed hands, although it would still buy the cream, and as far as capacity went, even skim the milk for the farmers. Still there was no outlet for the skmmilk. Many of the farmers had for years been accustomed to sell their whole milk and had, therefore, not enough hogs and other live stock to consume the skimmilk advantageously. Also, many of the dairymen did not even have hand separators with which to skim the milk.

Farmers Take Action

It was evident that something had to be done and done quickly in order to prevent too great a loss of milk and money and to avoid recurrence of such conditions. A few of the more progressive farmers got together at once and talked over the situation. They called on the commissioner of agriculture, who advised calling a meeting of all the patrons in order to see if it were not possible to form a co-operative organization, similar to the one so successfully operated at Richmond. To this meeting he promised to send his marketing specialist to explain the nature of a co-operative organization and to help carry the work along.

This idea appealed to the farmers and a meeting was called the next morning. At this meeting the principles of a real co-operative organization were outlined, and the advantages and disadvantages fully explained. As the proposition seemed feasible, a temporary organization was formed, but it was decided to make a survey of the conditions before the organization was made permanent. The survey was to include such data as the number of cows available and the number of shares, at the rate of $5 per cow, each farmer would be willing to take. The farmers themselves were to do this work and appointed men in each locality to secure the information. The county agent helped at large where most needed and another meeting was scheduled at which the reports were to be handed in.

Form Co-operative Organization and Buy Plant

While the survey was being taken, the officers of the temporary organization did not waste their time but hustled around to see if it were not possible to secure in one way or another the money which was outstanding. As before mentioned, the receivers of the bankrupt firm would not guarantee to pay the money, but the farmers were able to secure an option on the plant and equipment.

At the following meeting it was found that over fifty farmers, representing some 1,200 cows, were willing to send their milk and subscribe stock. In addition to those guaranteed, there were available 1,500 to 1,800 cows within the territory which might be available after an organization was perfected and successfully operating. The conditions there were no different from those prevailing elsewhere. There are always some people who are willing to s port an organization which is ben cial to them, but who are unwilling help it along until it is an assu success.

On account of the encouraging sults obtained from the survey, it decided to form a permanent orga zation. This was done, officers w elected, and the association incor ated under the state laws of Verm on the one-man-one-vote plan, v no proxy voting allowed. A comm tee was appointed with power to the plant from the receivers, e though it might be necessary to pa rather high price for it. Since o parties were interested, the plant equipment were bought at once $17,000. The farmers realized three important factors were in t favor. First, it would insure that money the former company o them would be saved; second, would, to a certain extent, elimi outside competition because o parties would hesitate to come in build a plant where one or two already in operation; third, could start to operate at once an this way save considerable mone preventing waste of produce. M over, owing to war condition would be both difficult and expe to build a plant, although a more able one might have been planned

Pattern After the Richmond

In making up their organiza and framing their constitutional laws, the Middlebury farmers terned after the Richmond co-o tive plant as much as possible, making such alterations as were essary to suit local conditions.

The association was incorpo for $50,000 divided into 2,000 s at $25 each. At present they h total investment of $20,000 with capital stock of $6,800. The inv money is returning 6% int which is all that the by-laws The paid-up capital stock is small because the rate of subscri mentioned is $5 per cow. Bu

ADDISON COUNTY, VERMONT, FARMERS' CO-OPERATIVE CREAMERY

Note the neat appearance of the creamery grounds, also the large ice house, and the office which is located next to the receiving room. The little shed at the extreme right was used f canning kitchen last summer. Note three different ways of delivery—automobile, individual, and co-operative.

PASTEURIZING AND SHIPPING ROOM AT THE ADDISON CO., VERMONT, FARMERS' CO-OPERATIVE CREAMERY

The milk is properly cooled here (pasteurization is done only when requested by the buyers) before it is canned and shipped in iced refrigerator cars to New York City.

ıers thought it best to incorporate ın amount large enough to cover re buildings and equipment, as as to provide means for other rities, such as buying of feeds, lizer, etc., should they prove de- ıle adjuncts.

Method of Operation

ı April 1, 1918, the Farmers' Co- ative Creamery at Middlebury .n to operate. They started to sell : milk in New York, where it is sold, although under a different ract. At present they have a six ths' agreement, whereby they re- : New York Dairymen's League :s, plus an additional stated sum cwt. to cover operating expenses.) begin with, there were 58 pa- s, which number has already been :ased to 86, and there are indica- ; that more will be added short- Some of the newcomers are not stockholders but will automatic- become so whenever their share he sinking fund becomes large gh to pay for their shares, should choose to wait that long before ng the company. This is a good ıgement because, besides being to the producer, it helps to safe- d the co-operative association as

ıother good feature of the consti- n and by-laws is that when tron for one reason or another draws his products from the nery, he will forfeit his shares ock, together with his interest in ›roduct on hand and in the sur- fund. All shares of stock offered ale for any reason shall first be :d to the organization at par val- nd can be sold only with their nt.

ticle XI of the by-laws deals the care of the products as fol-

:tion 1. "Milk or cream shall be ıced and cared for by the patron cleanly manner and delivered to :reamery frequently enough so it will be sweet. The directors embers shall formulate and en- by suitable penalties reasonable concerning the production, care, lelivery of milk and cream."

:tion 2. "In case a patron de- ; cream which is sour or unfit for ıg the best quality of butter, he receive five cents less per pound ıtterfat. The directors or their ; may reject any cream they find for buttermaking."

the stipulations in the above ar- were followed out in every ıery and milk plant in the coun- s well as they are at Middlebury, ıould not have any difficulty with quality of dairy products and ıeutralizing question would be :ked out" forever, and the competing value of the various butter substitutes greatly reduced.

Secure Competent Manager

One of the most important reasons for the success of the creamery is that the Middlebury farmers avoided the mistake, which is too often made by farmers' organizations, of hiring a cheap manager. On the contrary, they searched the country for the best man they could get and were successful in securing the services of N. C. Nelson, formerly of the Grove City, Pa., creamery. In addition to knowing the details of handling the milk and cream and keeping the plant in first class condition, he is constantly on the lookout for the best interests of the organization. He sees that the products leave on time and are in proper condition before they leave the plant. He is also planning for the future, by getting the creamery furnished with butter and cheese making equipment and suitable refrigeration facilities so that they may ever be ready to handle their products to best advantage, should emergency cases demand it.

Make Good Returns

Owing to the excellent quality of the product sent out from the creamery, they have no difficulty in securing a ready market at highest ruling prices. Although having run only a short while and with all the difficulties, inconveniences, and unavoidable losses in starting a new organization, they have been able to make good returns to the farmer. The increased patronage indicates this and the prices prove it. In August, for instance, they paid 13c more for butterfat than the local creamery and for the following months a similar difference may be expected.

As soon as the creamery began operation, the Bureau of Markets system of accounts was installed and helps greatly in keeping the records straight. In this way, he is able to tell at any time just how the business stands. It is unnecessary to mention, of course, that Mr. Nelson takes care that daily tests for butterfat and weekly sediment tests are made.

New Avenue for Co-operative Creameries

A description of the Middlebury Co-operative Creamery would not be complete unless mention is made of a rather unique way in which this creamery has proven its value to the community. The home demonstration agent of the Farm Bureau, Miss Emma Fuller, conceived the idea of a community canning kitchen in which to do canning on a large scale and prevent loss of much valuable food products in the shape of fruits and vegetables which might otherwise spoil. However, she met with little response until one day when she approached Mr. Nelson on the subject. The trouble was that there was no available money or suitable place to carry on the experiment. Mr. Nelson saw that here was a chance to improve an opportunity, so he requested the directors that they allow Miss Fuller to use a little store-room shed, adjacent to the creamery. They consented and promised to provide space, use of equipment, and steam free of charge in order to help the project along. A few extra pipes were purchased and with these Mr. Nelson fixed up a couple of old steaming tanks and a suitable canning kitchen at the small cost of $15.

The experiment proved a success. Over 1,000 gallons of vegetables, fruits, and meat were canned. The farmers brought in their produce, furnished jars and paid for the actual cost of canning, which in the early part of the season was 3c a pint, 4c a quart, and 7c for two quarts, but during the latter part of the season, the charge had to be increased to 5c per pint, 6c per quart, and 10c for two-quart jars, as help was more difficult to get then. Boys and girls from the graded and high schools did the work and were paid 8c per hour. An experienced woman had charge of the work, for which she was paid regular wage, while Miss Fuller donated her services. It is estimated that one-half of the products canned would have been wasted had it not been for this canning kitchen and much money and labor was saved for the already too busy housewives in the country. Owing to sugar shortage, the amount of fruit canned was not as large as usual. However, people from ten towns took advantage of getting their canning done and the work will be continued on a larger scale next year. Drying of fruit and vegetables, a little of which was done this year, will also be continued.

While it was some bother and expense to the creamery to have the work done there, they undoubtedly profited by it, because in addition to proving their public spirit they also got people acquainted with their organization and interested in what it stands for.

Other Co-operative Creameries Do Well

Middlebury is not the only co-operative creamery in Vermont which is doing well. Within the last couple of years, about a dozen have been organized and all of them are a benefit to the farmers in their community.

At Richmond, Vt., they have been operating for over two years and are meeting with increased success. Last year, it will be remembered, they paid their patrons over $10.00 more per cow than any other creamery in the state and this year the prospects are fully as good. Their patronage has been nearly trebled and two other creameries have been organized and put under the management of Mr. Edwards with good results.

While the unusually high prices for milk and the comparatively low prices for butter have made it difficult for the small co-operative creameries to hold their patronage, a number of them have been able to do so by selling part milk and part sweet cream. At Richmond they have been able to handle most of the produce from three

(Continued on page 747)

RECEIVING AND TESTING ROOM AT THE ADDISON CO., VERMONT, FARMERS' CO-OPERATIVE CREAMERY

Each can is washed and steamed before it is returned to the farmer. Mr. Nelson stands with the sediment tester which is frequently used as is also the acidity test in determining the quality of the milk.

FARMERS' CO-OPERATIVE CREAMERY AT RICHMOND, VT.

This plant is strictly co-operative and has now been running successfully for two years. The first year it saved its patrons over $10 per cow after having paid higher than any other creamery in the state last year. December 1, 1918, the results will be still better. Receiving room is 10 ft. higher than work room floor and all milk flows by gravity. Milk, sweet cream, butter, and various cheese are handled whenever most profitable.

A DAIRY FARM ROMANCE

RUDOLPH R. KREBS

NATHAN Feinwell took off his heavy shoes and put them down beside his chair, yawning audibly as he did so. In his stocking feet he shuffled over to the water bucket and took a deep drink. Then without a word he moved over to the bracketed kitchen lamp, turned it down, and blew out the light.

The young people in the parlor waited in silence. They heard him slowly climb the creaking stairs, heard the shuffle of his stocking feet as he groped his way along the unlighted hall to the front bedroom. Then, at last, the protesting squeak of the springs directly above them came as a signal that his day was ended, and that his troubles would soon be smothered by snores.

From her corner of the hard horsehair couch Doris Feinwell sighed, and young Jim Simmons breathed a breath of relief.

"I can't seem to get next to him, somehow, Doris," the young fellow said. "Heaven knows, I've tried hard enough, but he won't meet me half way; he won't even come part of the way. I'm sorry, girlie. It makes it mighty hard for you."

Doris' eyes, that usually were dancing and gay when she was with Jim, reflected the trouble in her young heart. She reached out and covered Jim's hand with her own.

"It does, Jim. Sometimes I think I can't stand it much longer, and, if it weren't for poor mother, I—Oh, I musn't say that! It's Tom Ostberg, Jim. Dad's set on my marrying him. He thinks I ought to be tickled to marry a man with as big a farm as Tom has. He thinks I ought to jump at the chance of joining our farm with Tom's. That's all he thinks—land, land, land, and more land! And what has he or mother ever got out of it? Nothing but work and worry and scrimping and saving all their lives. And Dad's against you because you've gone away to school and—"

"And haven't any money," Jim finished for her, a little bitterly. "Lord, Doris," he groaned, "it's almost a crime to ask you to pass up a man with money for a worthless cuss like me. I've got a pretty good job, and will come out all right some day, but it will be hard sledding for a few years until I get a farm of my own."

Jim's shoulders sank dejectedly. But Doris, loyal little trump that she was, sidled a little closer to him, and pressed his fingers reassuringly.

"Dad worked himself to death on the old farm trying to make things go in the old hit-and-miss way, and if it hadn't been for the land increasing in value year by year there wouldn't have been anything left for me to go to school on when he died, because Dad never made any money on his crops or on his herd. Every crop was eaten up before it was harvested. Even as a kid, it seemed to me that there was more to farming than just that hand-to-mouth existence, that it was the finest business in the world if it was managed right. And I believed that so strongly that I determined to make a smashing big success where Dad had failed. I knew that a man could become a good farmer through the mistakes and successes he made on his own farm, but it would take fifty or sixty years to do it. And it seemed to me to be such a wasteful way of getting anywhere. And I resolved then to go to school and get the scientific as well as the practical side of my business. Then Dad died, and the debts against the place almost swallowed up everything. But I stuck to my determination. I've told you all this before, and I guess there's really no need of going over it again."

"But, Jim, you are getting somewhere. You're doing a lot of good for the farmers in your county. You've broken down the prejudices of these farmers in your county who were most opposed to having a county agent, and now you haven't stauncher friends than those very men. And some day—"

"Some day, Doris, I'm going to have the best farm in this part of the country. I'll have the best fields, and the best herd, and the best barns—Ah, I've dreamed about that time many a night. I've pictured a cozy farm house, with shrubs and flowers around it, and a soft green lawn sloping to the road in front; electric lights and running water, and good steam heat, and everything just as convenient as could be for you. For I've pictured you as sharing this with me, just you and me, girlie. And I'd be working only to make you happy. That's my dream for you, and it's the biggest thing that could happen to me.

"But I'm only a county agent, with irregular government pay, and I guess Tom Ostberg could give you more than I could right now. You'd be here near your mother, and—well, Doris, if you want to change your mind, why, it's all right. Little girl, I'd rather see you happy than anything else in the world!"

Jim Simmons snatched at the little hand and pressed it fervently, and then picked up his hat and bolted for the front door, a thousand little aches tugging at his heart. But as he turned the knob, a soft hand closed over his, and a voice whispered in his ear:

"Jim, don't you want me? Jim, what's the use of my waiting for you until your dream comes true? Why not let both of us have the fun of waiting and working for it to come true? Take me, Jim. After it's all over Dad can't object."

Jim stretched out his strong young arms.

Some time later—an hour or so, or maybe two or three, what's time to two young folks?—young Jim Simmons stepped out into the night, treading on air, his head bared to the cool night wind, his whole being suffused with the great joy that had come to him. And Doris, feverishly excited and frightened a little, crept softly past her father's door to her own room. She lay for a long time staring unblinkingly into the darkness overhead, planning, and wondering whether she dared tell her mother that the morrow was her wedding day.

Contrary to Doris' half-formed expectation, however, Nathan Feinwell did not come forward with the customary parental blessing. He had set his mind and heart on her marrying Tom Ostberg, not because of any personal liking for the plodding Tom, but, if truth were told, because it would have been a good match from the financial standpoint.

Doris had always been a dutiful daughter. She had been a good girl, not much given to frivolity, nor to extravagant ideas as regarded clothes and luxuries. These last qualities Nathan had long subconsciously recognized. He and his daughter had not been mutually affectionate. In a dumb, dormant way, no doubt, he loved her, and would have given anything rather than have seen harm come to her, but he had never manifested outwardly any affection. He, when he considered her at all, regarded her as "just one of the women folks".

Her unceremonious departure and brazen thwarting of his will had at first filled him with a seething, unreasoning rage. But, later, when his rage had expended itself in blind, feverish work, he was smitten with a sudden sense of loss. He began for the first time to realize how big a part his little daughter had played in the life of the farm. And, though he brooded over it, foolish, obstinate pride restrained him from revealing his true inward feelings to his wife.

Doris' mother, on the other hand, though she felt hurt at the girl's unconfided departure, was secretly glad on the whole that she had chosen and done as she had. Her married life had not been as pleasant as it might have been.

First there had been the mortgage on the original homestead that had to be paid off, and when that was accomplished and she had looked forward to a less strenuous existence, Nathan had saddled them with another eighty acres. And by the time that indebtedness had been liquidated, she had become so accustomed to resigning her hopes that she had offered little objection when Nathan declared his intention of taking over another eighty "to round off the farm for the girl", as he speciously suggested. So she gave up the idea of living in a comfortable home, of lightening her labor, of making the farm the place she wanted her daughter to grow up in. And so she had toiled and saved uncomplainingly, buoyed up with the hope that her daughter, dowered with the fruits of her sacrifice, would have things easier than she had had.

When Nathan had hotly forbidden Doris the house, Mrs. Feinwell's hope seemed suddenly turned to ashes in her breast. She did her work mechanically, silently, her mind fixed on the little girl-wife in her own home now, only a few hours' drive away in the adjoining county, but separated from her by the iron wall of ostracism Nathan had reared against her. The fall days seemed interminably long now, the nights long-drawn out hours of aching sleeplessness.

It was on a late November morning that her pent-up longing finally beat down her timidity.

Nathan sat alone at the table in the little kitchen and gulped down the hot coffee she had set down before him, but he refused to eat. When he had finished, he silently reached for hi hat and coat, preparatory to goin out to the barn. His face seemed un usually haggard and drawn this morn ing.

"Pa," said Mrs. Feinwell, with nervous little break in her voice, "pa why don't you give in? It ain't th work that's wearing on you. It ain' because Hank left last week and yo can't get another man to help yo with the chores. It's Doris. Wh don't you let the girl come back t see us? She's just as lonesome for u as we are for her. But she's like you She won't admit it."

A red flush mantled Nathan's thi cheeks.

"Well, then she'll never come!" he declared hoarsely. "D'you thin I'll get down on my knees to her an to that danged educated college dud with his new-fangled notions of farm ing? Guess I got along all right s far without any scientific help, and guess I can get along some more. don't need his advice nor help, and don't want it!"

"But, pa," pleaded the white-haire woman, "he never was meaning to b uppish. All he ever said was to Dori And he never mentioned you nor th farm either. And you know that h was right in what he said, too, but yo won't admit it. Pa, please tell Dor she may come back."

"I won't, and that's final. She made her bed and she can lie in it.

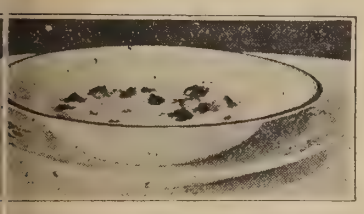
"She didn't do right, pa—I kno that," Mrs. Feinwell continued. "Sh knows she shouldn't have run off lik that, and she's sorry for it. You kno she is. And, and you can't blame he for wanting him instead of Tom Os berg. You know Tom Ostberg. He work her like his father worked h mother. But young Jim, I'd be prou to marry him myself!"

Nathan shook his head impatien ly.

"Now it's no use arguing any mo about it. I wouldn't see her in re want, but she can't come back he as long as she sticks to that whel He won't get this farm to monke with."

"He doesn't want it," flashed Mr Feinwell. "He didn't marry Doris f the farm, as your Tom would ha done. He married her to give her home of her own, a home in which h could lavish all his love on her. H doesn't have any money, and yet he giving her a better place to live than she's ever had here. What d we give her here anyway? Thr meals a day and a bare room in whi to sleep. There in town she's got w ter right in the house; she's got ele tric lights; she's got a furnace th keeps the whole house warm; a she's got a husband who isn't worki right along for the almighty dolla but who's working because he lik his work, and because the harder h works the nearer he'll get to having farm of his own on which he can gi Doris the things he wants her to hav I got a letter from Doris yesterda Here it is. Read it, and if you c still steel your heart against her a him, you're crueller than I'd ever b lieved you could be, Nathan Fei well!"

Nathan took the letter she thru out at him without being aware th he did so. His wife's outburst to



(Continued on page 756)

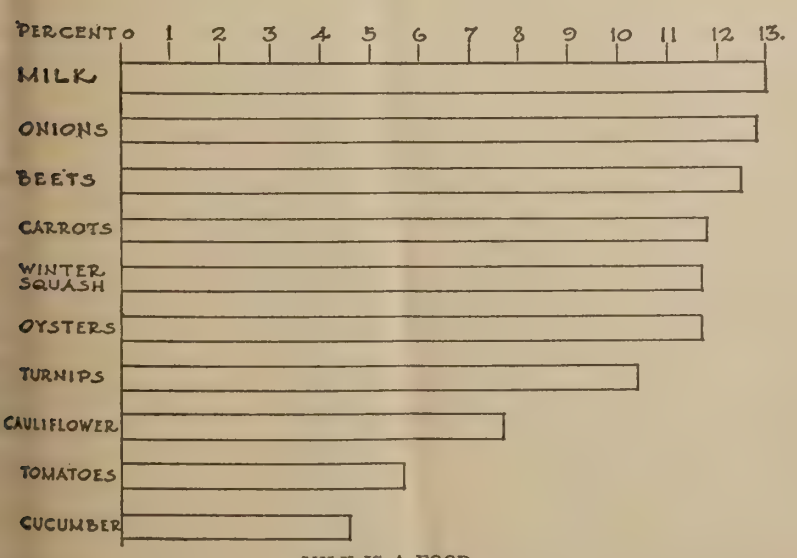
DAIRY DISHES

JESSIE M. HOOVER

WHY is it," a traveling man asked me this fall, "that the farm diet is so monotonous? I've been going from farm to farm for over a year now demonstrating a cream separator and almost everywhere I was certain to find the same things—meat, potatoes, and vegetables day after day, sometimes fruit, till I fairly dreaded mealtime. The queer part of it is that most of those farms kept at least one cow, but I could count on my fingers the times I saw milk on the table. Finally, one hot day, my wife longing for a glass of cool buttermilk and I powered me and I asked my host if she ever made butter. 'Yes' I made butter. 'And the butter-milk?' I asked. 'Fed to the hogs,' was the answer."

BUTTERMILK SOUP, A FOREIGN DISH TO TEMPT THE AMERICAN'S PALATE

The more I thought about the traveling man's story, the more I wondered why the live stock got all that buttermilk and the wholesome skimmilk that were left as by-products of butter. We have such a gigantic task ahead of us, that of feeding the world, that it seems as if such a thing as skimmilk should be used largely for human consumption. Despite the fact that transportation often makes it difficult for the woman on the farm to obtain substitutes for use in cookery, she is the envy of the city woman; her farm resources offer such possibilities for a varied diet.



Take milk, for instance; it is rich in protein, needed for muscle and tissue growth; rich in lime, needed for bone; and it contains important growth-promoting factors. Few people think of fluid milk as being a food, yet milk contains more solids than any of the foods shown in the accompanying chart.

Hot Drinks That Satisfy

Do you remember the hot ginger tea that was steaming on the stove when you came in from coasting or skating and how it warmed you to your very toes? Many a person likes hot coffee on a cold night because it is stimulating. Did you ever discover that hot milk had the same effect? The French prepare a drink they call "Cafe au lait". They heat milk piping hot and add to it a little coffee which has been prepared four times its usual strength. Why not try this some night when the men come in nipped by the cold? It will be a reminder, perhaps, of the days of ginger tea and not only is it stimulating, but it is nutritious and has the real coffee flavor as well.

There are many recipes for cocoa, probably the one below is not new to you but it has a large amount of milk, which makes it extra good.

COCOA (enough for two):—3 teaspoons breakfast cocoa, 3 teaspoons sugar, ⅓ cup boiling water, 1⅓ cups milk, scalded, few grains of salt. Mix cocoa, sugar, and salt. Add hot water gradually, stirring constantly. Bring to boiling point and let boil one minute. Turn into scalded milk and beat for one minute with Dover beater. If more nourishment is desired one egg may be added. To do this, beat the egg until light and frothy. Add hot cocoa gradually and continue beating. This should be done quickly in order not to allow the cocoa to become cool.

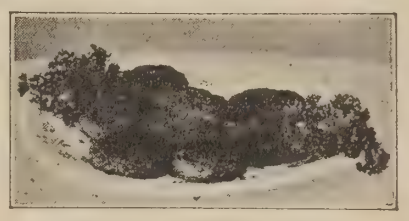
MILK IS A FOOD

Milk, though a liquid, contains more edible solids per hundred pounds than other foods that the average person calls "solid foods". Considering this, makes plain the slogans: "Eat Milk", "Milk is Food and Drink". The length of the lines in the chart tells the story, as it indicates the comparative amount of edible solids in various foods, and many others could be shown.

Making Eggnogs Tasty

I was once confronted with the problem of giving large quantities of milk to a convalescent patient who had taken a great dislike to it. After many trials I learned that this patient was especially fond of chocolate, and so, by adding a teaspoon of chocolate syrup made by the recipe below, I was able to obey the doctor's orders and please my patient at the same time. Add a little chocolate syrup to your eggnogs and milk shakes. They will taste as good as soda fountain drinks to the youngsters.

CHOCOLATE EGG AND MILK SHAKE: 2 tablespoons finely crushed ice, 2½ tablespoons chocolate syrup, 1 egg, ⅔ cup milk. Put ingredients in glass and shake thoroughly (using one of the shakers that may be bought at any kitchen furnishing store), and strain into another glass for serving. Either grated nutmeg or ground cinnamon may be sprinkled on top if desired.—FANNIE MERRITT FARMER.



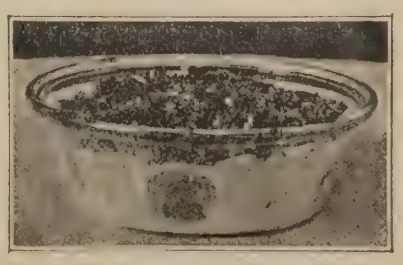
PIE—AMERICA'S MOST POPULAR DESSERT

CHOCOLATE SYRUP:—4 squares Baker's chocolate, 1¾ cups sugar, 1-8 teaspoon salt, 1½ cups boiling water. Melt chocolate in double boiler, add sugar and salt, stirring until well mixed, then pour boiling water gradually while stirring constantly. Stir until smooth, bring to the boiling point and let boil 5 minutes. Cool, turn into a jar, and keep in an ice box or cold place.

COCOA EGGNOG:—White of 1 egg, 1 teaspoon sugar, 1 teaspoon cocoa, ¾ cup cold milk. Beat egg white until stiff and add gradually, while beating constantly, sugar, cocoa, and salt. Add cold milk to one-half of the mixture, beating constantly. Turn into a glass and pile remaining egg mixture on top.—FANNIE MERRITT FARMER.

Milk for Soup

Milk lends itself to the most simple one-dish meal as well as to the elaborate course dinner. If the men have had a cold drive in the snow a hot milk soup at the beginning of the meal will go a long way toward warming them up. The foundation may be whole milk, skimmilk, buttermilk, or any of the prepared milks. Such soups are usually called cream soups, because they resemble the consistency of cream. Thicken the required amount of milk with flour, (wheat, rice, or bean) cornstarch, or crackers as desired. To 1 quart of milk add 2 tablespoonfuls of flour, 1 to 2 tablespoonfuls of butter, and 1 teaspoonful of salt. Prepare as for gravy and cook thoroughly, being careful to avoid lumping. For flavor, use a few dried celery leaves, a slice of onion, or chopped parsley. Add to this foundation finely divided portions of anyone of the following: Cooked potatoes or vegetables, meat, fish, cheese, corn, tomatoes, ground chicken, minced clam, or oysters. The proportion required is about as follows: 1 quart of cream soup foundation to 1 cup or 1½ cups of pulp of any of the above. Heat thoroughly after combining and serve in hot soup dishes. For tomato soup hot tomatoes are slightly neutralized with a little soda before combining with the hot milk, and after they are combined the soup is served at once without further heating. Serve crisp crackers or toasted bread with cream soups. A spoonful of whipped cream adds to the flavor and appearance of any cream soup.



COTTAGE CHEESE SAUSAGE
It's hard to convince people that these aren't real sausages.

Denmark is a great dairy country and it is only natural that the Danish people use milk in large quantities in their diet. I have been told by a native of that country that once a week, without fail, buttermilk soup finds its way to the table. Does it sound strange to you? However, it is a most tempting dish and the next time you churn butter save some of that valuable buttermilk and make this soup for the family. There is a pleasant surprise in store for them.

BUTTERMILK SOUP:—1 quart buttermilk, 2 tablespoonfuls flour, ½ cup raisins, currants, or other dried fruit, a few pieces of cinnamon, ¼ cup of blanched sliced almond meats, 2 ta-

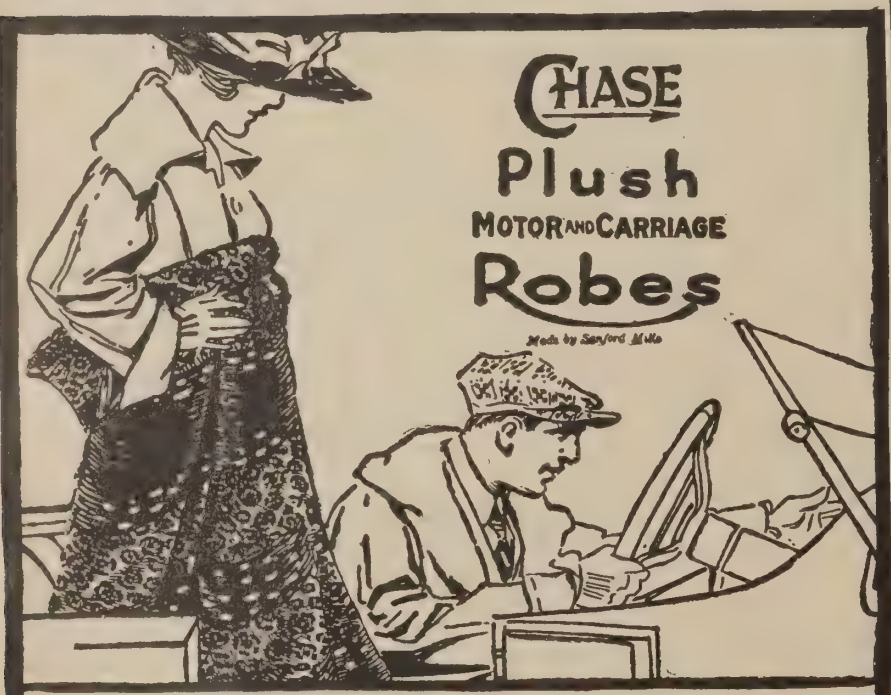
Babcock Milk Tester Complete $12.00

Any Cow Owner Can Make Accurate Milk Tests With the Efficient and Simple Crepaco Babcock Milk Tester

There is nothing intricate about it—operated by hand. There is a size for every dairy, from the 2 bottle tester to the large size with 24 bottle capacity.



This tester is noiseless in operation, the high speed being attained without unnecessary friction, by means of a spur and worm gear with cut teeth. The full instructions which are supplied with each machine tell you how to make accurate milk tests.

Crepaco Babcock Tester complete with glassware as illustrated above—six bottle capacity costs only $12.00.

We have Babcock Testers as small as the 2 bottle size costing $4.25 complete with glassware.

Our big Dairy Catalog describes fully, all size Milk Testers and other appliances of value to the dairyman. Write for it TODAY.

What is the Matter With the Milk Situation?

[Continued from page 729]

mysterious disappearance during the fruit canning season.

The consumer fails to understand because he does not know the expense of icing and hauling the goods by rail, of the upkeep of wagons and teams driven rapidly over the pavements every day in all kinds of weather, nor of delivery when the drivers' union sets the wage and the extra pay for excess delivery.

Nor does the consumer discriminate sufficiently between the delivery of milk and the delivery of his package from the down-town store. In the case of the merchandise, the buyer himself went to the store, made the purchase, and paid the bill so that nothing remained but to make the actual delivery,—a job that almost any boy could perform.

In the case of milk, however, the consumer stays at home and bargains with the milkman. Now this milkman is not so much a delivery boy as a perambulating dealer. He must not only keep on as good terms as possible with his customer while receiving complaints and explaining delays, but he must also keep a weather eye open for new business and also collect before it is too late from the customer across the street when the moving van stands backed against the curb. This is salesmanship, and actual delivery is a mere incident. It is a full man's job that costs money to the dealer.

This is one of the principal reasons why milk costs so much more in a city like Chicago or Philadelphia than in outlying towns where delivery is often made by the farmer himself at whose farm the milk was bottled with more or less attention to sanitation, if indeed the delivery is not made by a boy peddling from a worn-out family buggy.

Again, the consumer never heard of the surplus—that excess over the daily demands that nobody wants, that the farmer cannot use, and that the dealer must after some fashion get rid of in ways that will not entail too much loss. It would surprise the customer, too, to know that in general both farmer and dealer lose money in the winter and try to make it up in the summer. Never having heard of these matters, they do not concern the consumer who has troubles enough of his own, hence they do not go into the reckoning as he keeps the account against his natural enemies.

Somebody ought to explain to the consumer why it is that the price of market milk is so much above the relative price of butter, and why it is that milk is often notably cheaper in outlying creamery sections than in the districts that supply the city trade, When this is done he will understand that the butter of the country is made mostly from "summer milk", produced from pasture grown on land largely unsuitable for cropping and that it is often a by-product of general farming. City milk, on the other hand, is "winter milk" made largely from purchased mill feeds or farm grown grains—the most expensive of all known cattle feeds.

When he knows all the facts, he will know that there is little milk to be had at any price from the creamery districts in the winter time because most of the cows are dry, while it is the flush season in the districts that cater to the city trade. In short, that winter milk in creamery districts represents not a real business, but a commercial accident like a remnant sale—such as the "pound calica" of other days or the bargain counter of today.

From Dairy to Grain

So far as present conditions are concerned, conditions which have grown largely out of the war, the city consumer was not prepared a year ago to realize the extent to which dairy farmers would turn grain raisers in the face of a shortage of labor, with an increased wage, and in response to the government call and a higher price for wheat.

The consumer did not know that many eastern and middle western farmers had once been grain raisers but had been driven into dairying by the competition with the excessibly cheap wheat from the Great West, nor did they appreciate the readiness with which, under adverse conditions, they would return to their first love, the wheat field, and "take a rest on milking".

It was this general ignorance of the facts which was responsible for the consumer's savage frame of mind last winter and which in spite of all that could be said or done drove him into an attitude which not only injured the business of dairying, but which is already reacting in the form of higher prices than would have prevailed if he could have been persuaded to take a more rational view of the situation.

The city consumer did not believe the farmer when he pointed out the inevitable result, for if grain raising were so attractive why should he be insistent upon a higher price for milk. He did not understand the reluctance to sacrifice herds that had been many years in building up, and yet the farmer yielded to the inevitable as all intelligent prophets predicted.

A reduction not only in herds but in numbers of existing herds has taken place at a rate easily foreseen by the well informed, but not expected by the consuming public,—a lesson in industrial adjustment which the country cannot afford to teach itself too often because it means not only a lessened supply, but consequently a higher price.

The Cost of Milk

Fortunately we have reliable information upon the cost of producing market milk. It is not so easy to say what summer milk is worth because it is produced largely upon pasture and often on land that is of little value for other kinds of farming But market milk is produced the "year round", which means in practice that the bulk of it is made of grain and hay grown or bought for the purpose and having an established value in the markets. Cost accounting methods have given us also the amount of labor involved, so the problem of the cost of milk is reduced to the same form as that of producing shoes or machinery out of raw materials and labor.

Data obtained from various sources differ somewhat as to the labor item but as milk making on the part of the cow is a physiological function, the amounts of feed are practically constant. The following table states within a very narrow limit of error the cost of producing milk in terms of materials and labor, other items such as taxes, housing, and general upkeep being offset by returns other than those from milk; for example from manure, old cows, etc. The feed and labor include the cost of keeping a sufficient number of calves and heifers to replenish the herd as it wears out.

Approximate Cost of Producing One Hundred Pounds of 3.5% Milk

44 pounds of grain or mill feed
50 pounds of hay
188 pounds of silage or its equivalent
40 pounds of roughage—straw or cornstalks.
2.4 to 4 hours labor

The only problem is to assign values to these items after which the money cost of one hundred pounds

ilk or forty-six quarts ready for the ottle can be derived.

The values of grain and hay are xed in the market, but many ac- ountants object to allowing the farm- the market price for the product his fields upon the ground of double rofit. This may be a point for ac- ountants to quibble over, but the ractical fact is that while the farmer ay feed steers at a rate which will eturn only market prices for his feed nd do it willingly for the sake of eeping the fertility at home, he will ot milk cows unless he can make a rofit on the feed over and above what would bring in the open market. airying is a laborious and confining siness and it is not followed as a astime.

The value of silage is well known nd the only feed item of uncertain alue is the straw, cornstalks, or her roughage worked over and used r bedding.

Labor presents a more difficult roblem. In the discussion before the arious milk commissions last winter e farmers claimed thirty cents an our. In some cases it was allowed, others not. In Chicago, for ex- mple, the price was held at twelve nts a quart, which netted the farm- about twenty-two and one-half nts an hour even though fifty, sixty, nd seventy cents an hour were recog- ized and paid to union labor.

If the farmer had been allowed the inimum wage of the soft coal miner, n the basis of an eight-hour day with me and a half for overtime, milk ould have cost Chicago last winter bout seventeen cents a quart. The ty was willing to pay but twelve, nd at that, cut the consumption to ighty per cent of the normal. Result: he farmers, being unable to sell the rplus at enough to repay the cost of roduction, were forced to reduce the ield by cutting down the herds and many cases by going over to grain rming. Consequence: Chicago is aying now fourteen cents a quart or out a cent more than would have een necessary had that city support- l the industry instead of paralyzing

From the Public Point of View

The producer, the dealer, and the nsumer alike are interested in the abilization of the dairy industry. o far as it provides a standard food pply, it is too important to jeop- rdize. So far as it is a form of farm- g, it is too valuable to the country be injured and it is too laborious nd too expensive to be trifled with, r men cannot go in and out of the iry business upon short notice ex- pt disastrously. As a distributing siness it is one of the most delicate- balanced lines of trade and one of e most expensive and exacting to rve, involving all kinds of people nd all kinds of weather every day the year.

It would be to the advantage of all a campaign of education should be ndertaken with all the thoroughness a German propaganda, the purpose which should be to take the public to entire confidence in all matters ncerning the production and dis- ibution of market milk, its value as standard food, and its peculiar ace in the dietary, especially of chil- en and invalids. Let the merits of ean milk meet the eye as often as stum or Quaker Oats or Cream of heat, and soon the troubles between e dairyman and the dealer upon the e hand, and the customer upon the her will largely disappear.

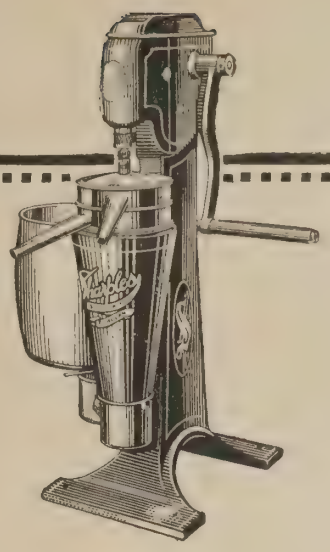
In all this matter the press should nd its powerful influence. The con- mer should be made intelligent, and ove all he should be kept good na- red. His patronage should not be ified with by hasty statements of lf-informed writers bent on creat- ing a sensation rather than establish- ing trade.

Money spent in a campaign of education would be well invested, and the producer as well as the distributor has a story to tell the consumer. Above all, let confidence return to the trade and let distrust and recrimination be put aside as too childish to enter into so important a matter as the milk supply.

We are at the beginning of what promises to be a new era in many of the relations of life, an era when, hopefully, selfishness shall not be the ruling passion, but in which the interests of the public shall be the guide to business; an era in which the production of staples is to be recognized as a public asset to be nourished and developed and established.

Controlling Influenza in Horses

The following extract from a letter written Wayne Dinsmore, Secretary of the Percheron Society, by an experienced horseman who has had more than six months' service in an Army Remount Depot, offers some very valuable suggestions to horsemen who have to deal with influenza. The final method mentioned has been adopted in practically all the Remount Camps and is giving good results everywhere.



"When you speak of influenza you hit the most troublesome knot in our whole remount business here. Weather conditions here were bad. Cold, then warm. Some snow all the winter but most of the time melting. A great deal of sleet and always mud, ankle to belly deep.

"The first trial control was a shot of vaccine at point of shipment followed by vaccine on arrival. Stabling and open corral handling were both tried. This treatment seemed without results. Next the animals were given a large shot of vaccine when shipped and none on arrival. Results the same. Then no vaccine was given and results were about the same.

"The final method and the one which seemed to be the best—at least both percentage of sick and percentage of death rate dropped a good deal—might be summed up as isolation and sanitation. Cars were disinfected before shipment and one side closed. Plenty of fresh air was admitted through the open side but no draft straight through. Corrals were disinfected by a special crew constantly at work with hand spray pumps. All corrals (feed racks, grain troughs, water troughs, and fences) were gone over weekly and sick corrals three times each week. A veterinarian with crew of men went through the new corrals twice a day. As stock came in it would be put in a corral for quarantine. Probably three days' arrivals could be put in each corral. They were held there for ten days. These I have termed "new" corrals. All animals showing symptoms of sickness were caught out and transferred to isolated influenza corrals. The influenza corrals each held around five hundred head.

"The old corrals or the stock released from the ten-day quarantine was gone over once a day and sick animals transferred.

"In the influenza corrals every effort was made to reduce the mud and water. No treatment was given. Daily the animals were run through a chute. The well ones transferred to the old released corrals, the very bad cases sent to open corrals to be blanketed and given stimulants, and the pneumonia cases sent to stable hospital. The balance left remained in the influenza corrals to be run through the chute the next day. The system of sanitation and isolation seemed to get results. Don't think I'd be exposing any secrets if I said the death rate dropped from well over a hundred a week to ten or less a week as a result."

A Cheerful Separator

Cheerfulness is a lubricant that makes the world run smoother. And the application is true of machines as well as humans.

That daughter of yours. You ask her to do something. She *cheerfully,* quickly and thoroughly does it. No hesitancy, no questioning, no "dingdonging" her. She is a jewel.

That quick stepper of yours. You chirrup once. Off he goes—no hesitancy, no lagging, no dingdonging. He *cheerfully* responds.

That cheerful hired man. He tackles his job quickly, works cheerfully for your interests, does his whole duty. No dingdonging needed—that's why you *value* him.

And that *Sharples Separator.* If you're tired or not strong, and drop the speed down low, cheerfully the milk flow drops in exact proportion. No dingdonging—the Sharples acts instantly, effectively, skims clean as ever. Increase the speed, and *cheerfully* the milk goes through faster. No change in cream quality; no need to watch it—no hesitancy. Working quickly, thoroughly, uniformly, the Sharples Separator is a *cheerful* companion. Makes those who use it cheerful, because it lightens labor and brings greater profit.

The secret of the *cheerful* service of a Sharples Separator is the *suction-feed.* No other separator has this patented, all-important principle.

SHARPLES

—the *only* separator that will skim clean at widely-varying speeds
—the *only* separator that gives cream of unchanging thickness—all speeds
—the *only* separator that will skim your milk quicker when you turn faster
—the *only* separator with just *one* piece in bowl—no discs, easiest to clean
—the *only* separator with knee-low supply tank and once-a-month oiling

Cheerfulness is a new angle from which to consider a Sharples Separator. Think it over—then write for catalog to nearest office addressing Dept. 10.

Barnesville Milk and Cream Producers' Association

W. H. VAN SOYOC, OHIO.

THE organization of the Barnesville Milk and Cream Producers' Association was the outgrowth of conditions that had become well-nigh unbearable, both to the dairymen and the creamery people. Previous to the organization of the dairymen of this community, each dairyman made his own contract with the creamery people. If the contract was made during a period when there was a shortage of milk, he received a fair price but if made when there was a surplus he received a low price; hence, there were almost as many different prices as there were producers. Added to this some of the milk was sold on a butterfat basis and some regardless of test with the result that some unscrupulous dairymen, and there are such, would skim their cans and make the cream into butter, sometimes enough for the family use, while the honest dairyman would sometimes have his test drop as much as one per cent below the actual test. The result of these conditions was a lack of confidence on the part of both the producer and distributor. Dissatisfaction had, indeed, become so universal on the part of the producer that on most any Saturday afternoon a constant stream of men could be seen entering the office of the dairy company, until life for the manager became a burden.

In the spring of 1915, conditions became so bad that a few of the producers met and decided to make an attempt to organize the dairymen of this community. Accordingly, a meeting was called and a membership of about fifty-five out of a possible one hundred producers was assured. The result has been, in some respects, unique in the history of dairy organization; out of chaos has come order, out of distrust has come confidence, out of seemingly diverse interests has come unity of purpose, until today every pound of milk received at the creamery is sold through the dairymen's organization, the creamery people refusing to buy any milk except through the organization.

The objects of the organization as set forth in the constitution are to stimulate the production of better and more sanitary milk, to secure a better and more uniform price for its product, to encourage consumption, and to guarantee to each individual producer that under the contract he will get every penny that belongs to him.

For the benefit of those who wish to know, I will give some of the most distinguishing figures of the organization. Perhaps the most unique feature, and, so far as I know, the first thing of the kind ever attempted by any dairy organization in the United States, and certainly the first of the kind in this section of the country, was the employment, by the association, of a tester and the installation of a complete steam testing apparatus in the creamery plant at Barnesville, Ohio.

At first the whole organization was looked upon as being the work of his satanic majesty and especially was this feature of the organization supposed to be the work of the devil, but after a few months' trial the dairy company became convinced that the purpose of the organization was to promote not only the interests of the producer but of the distributor and consumer as well, until now, after only three years, there has been established such mutual confidence, such unity of purpose, and such an era of good feeling that nothing would induce either party to go back to the method of the old days; instead of the stormy meetings between the individual dairyman and the manager of the dairy company, we have an executive committee which meets with the general manager, and while we generally spend the afternoon in friendly conversation and in discussing the great problems which now confront the statesmen of the world, most of which we have already settled to our complete satisfaction at least, I do not suppose that at any meeting during the past two years, except when the fool milk commissions have interfered, have we spent more than thirty minutes in actually making a contract.

I spoke of having a tester employed, but at the beginning of the organization such a step was not contemplated except as a last resort and so our first contract provided for a tester only upon the condition that the test of the company was not satisfactory. They evidently regarded this feature of the contract only as a bluff and determined to call the bluff as soon as possible, so for the first two months conditions, instead of growing better, grew worse. We then took the matter up with Professor Oscar Erf of the Ohio State University, and the dairyman's best friend, who at once became so interested in our organization that he came and personally supervised the installation of our testing plant consisting of a thirty-six bottle steam tester with all the other apparatus necessary to facilitate the work of the tester. So far, we have had in our employ four men, all certified by Professor Erf. Some have been called to fill better positions, some have been called to give their services, a precious heritage to their country, but all have done their work well.

Some of the duties of the tester are as follows:

(a) To see that the scales are kept in proper condition and to keep a daily record of all the weights.

(b) To take samples of each patron's milk daily and to test these samples once or twice a week as conditions may require.

(c) To send a weekly statement, to each patron, of the number of pounds of milk received from him daily and his average test for that week and at the close of each month the statement is to include the total shipment for that month and his average test for that month.

I will give a sample of the slips sent out:

The Barnesville Milk and Cream Producers' Association

Name .....

Dear Sir:

Your statement for this week is as follows:

.....

Date Pounds of Milk

.....

.....

.....

Total .....

Average per cent .....

Pounds of fat .....

Contract price .....

Tester .....

We have found that the sending out of these weekly statements has not only been a stimulus to production, but has been the means of keeping the individual dairyman in closer touch with the organization.

(d) In case of any injustice toward, or discrimination against, any individual it is the duty of the tester to notify some member of the executive committee, but fortunately no such need has arisen.

(e) It is also the duty of the tester to purchase all supplies, to look after all printing, etc. In short, he is our personal representative in the creamery. His salary and all other expenses of the association are provided for by an assessment upon each patron in proportion to the number of pounds of butterfat he sends. In the beginning the assessment ran as high as one cent per pound but now rarely exceeds one-half cent.

Through an arrangement with the creamery the check for the total assessment is sent each month, direct, to the treasurer of the association.

Our contract with the company also provides that in case any dispute shall arise in regard to the manner of testing, the matter shall be referred to the authorities of the Ohio State University, whose decision shall be final.

In the three years since our organization first came into being, we have saved to the dairymen of this community more than ten thousand dollars; but this, in reality, has been the least part of the work done. Before the advent of our organization we took our milk to the creamery and virtually said, "Here is the product of our own and our family's toil, take it and, if it is worth anything to you, pay us what you please."

But the old methods are changing now; under our present system the dairyman possesses a measure of independence that he never enjoyed before. He follows the product of his toil every step of the way until he gets his pay; there has opened to him a broader field and a clearer vision; a field in which his activities shall yet be recognized as a part and parcel of the great industries of our country and shall receive an equal compensation with them. A vision of the future importance and permanency of his calling, when he shall no longer be the serf and slave of others but a full partner in all the great industries of our country, sharing with them alike not only their burdens but their prosperity.

Such is, in brief, the story of our organization but it is not worth the telling if it does not inspire some other community with the spirit of cooperation. It had better be left untold if it does not, in some small measure at least, impress upon the dairymen who read these lines the absolute necessity of organization.

To the dairy industry, as to every other branch of agriculture, there comes, with peculiar force at the present time, the ever insistent question: "What of the future?" The answer to this question rests with the dairymen alone. I have faith in the future of the dairy industry. I believe we are at the dawning of a new, a brighter day, a day in which the dairyman and the agriculturist shall proclaim to the world the importance, the dignity and the preeminence of their calling. But this faith is not based upon any so-called uplift movements coming from the outside. Viewed from that angle,—the dairyman is doomed, his cause is absolutely hopeless; but my faith is based upon the fact that in the future the dairyman himself will be the compelling force that shall lift the industry from the dust into which demagogues and two by four politicians have trampled it and place it upon the same plane and upon an equal footing with the other industries of this country. Hence, in the years that are just ahead the three most important words in the dairyman's vocabulary must be: organization, **organization, ORGANIZATION,**—an organization so compact and far reaching that the dairyman of this country shall no longer be compelled to petition for his rights or plead his cause before his servants and even then be given a stone instead of bread from those who are his hirelings,—an organization so strong that he will not be intimidated by the threats of the mighty, or heed the mandates of those who arrogate to themselves authority which has never been granted them, or cajoled into silence or lulled into a sense of false security by the empty flattery of presidential proclamations or political mountebanks.

The need for organization has never been greater nor the time more opportune than the present. During the last two years the power of organization has been made manifest, the servile attitude of those in authority to the labor unions of the country. The standing invitation which Mr. Gompers had to visit the White House was not because of any peculiar brand of love the administration had for labor, but because Mr. Gompers held in his hands the millions of the labor vote. The failure to accord to the dairymen of the country a proper recognition of their rights and the appointment of committees composed of men from the unions, and whose sole qualification for the position was dense ignorance to arbitrarily fix the price of their products was not the result of disfavor or hatred on the part of the administration for the dairymen, but was due solely to the lack of organization on their part, hence they were not to be feared.

While the attitude of the present Food Administration toward the dairy industry has been a prolific source of confusion and, for the time being, has wrought infinite harm to the producer, yet it has taught the dairyman a lesson that otherwise he would have been long years in learning. Very often it takes a catastrophe to bring about a reform and if, out of the confusion into which the dairy industry has been plunged and the injustice heaped upon it, there should have been learned the lesson of cooperation and organization, the price paid will not be too high.

The past two years has witnessed more rapid strides in dairy organization than in any other branch of agriculture, but we are only at the beginning; we are just standing on the threshold. But when we consider that during the two years just past we have made greater progress in organization than during all the years of our previous history, we feel that we have great reason to be encouraged and that our faith in the future of the dairy industry is not founded upon a shifting point of sand. The work of organization must continue until it shall have leaped the boundaries of states, until it shall have crossed mountains and rivers and plains, until every dairy section of our country shall be united in a community of interest and of purpose. This will cost effort and it will cost money. Hitherto one of the great hindrances to dairy organization was the fact that while we were willing to reap the benefits of organization, we were not willing to pay the price.

We already have the leaders, such men as Professor Erf but we are well nigh helpless unless we have back of them with our money. If every dairyman in the United States would set aside 2% of his receipts for one year as a fund for organization and advertising, he would not only be paid manifold in a financial way but the future of the industry would be secure.

No matter how busy you may be it's time well spent to attend the farmers' institutes and community meetings.

Agricultural Press Pays High Tribute to W. D. Hoard

] Governor Hoard more than to any other hun-
e men, the great dairy industry of Wisconsin
s its growth. He preached dairying day and
g. He organized and led the movement which
c ed fair railroad rates for the dairy products
isconsin. He taught the people the value of
t r cows, and he instructed them as to the best
e ods of feeding. He proved the worth of his
a ings by maintaining a highly successful dairy
r of his own. By precept and practice he
ded into the consciousness of his hearers and
ers the fundamental principles underlying
c able dairy production and manufacture.
I 1888, without intention or desire on his own
r he was made the nominee of the Republican
r for governor of Wisconsin. He was elected,
erved the state well. It was during his admin-
ion that the law was enacted which required
e eaching of English in all public and parochial
ols. This law was resented by the large Ger-
a population in Wisconsin, and resulted in Gov-
r Hoard's defeat for re-election.
e commanding influence of the University of
onsin among the agricultural institutions of
e ountry is due in part at least to the wise coun-
nd guidance of Governor Hoard. As one of the
ats, he saw to it that the work in agriculture
ld not be overshadowed by the work of the
e departments of the institution, and as one
ie most influential citizens of the state he
it his business to see that financial support
ld be adequate.
rsonally, Governor Hoard was one of the most
al and companionable of men. As a platform
ker he was tremendously effective. Whatever
subject, and he seemed able to talk with author-
n about every subject in which people were in-
ted, he illuminated it with a fund of common
and a wealth of anecdote which his audience
d irresistible. His inimitable stories were al-
pat; they illustrated exactly the point he
ed to make, and his fame as an orator was al-
as great in the nation at large as his fame as
xponent of dairying. He was an omnivorous
er of the best literature, was well informed on
atters of human interest, a genial philosopher
found himself quite at home and welcome with
in all walks of life.
ie lives of W. D. Hoard in Wisconsin and
y Wallace in Iowa seemed to run in parallel
. Both were born on eastern farms in the year
. Both came west in early manhood. Both
a love for the soil, a passion for agricultural
vledge, and the desire to impart it to others.
started county papers, mainly for the
ose of building up a sound agriculture.
, with their sons, founded agricultural papers
h shortly became the leading authorities in
respective fields. Both devoted their lives to
promotion of agricultural truth. And both
at a ripe age, having lived lives of great use-
ess and power, and are universally mourned.
were warm friends who delighted to visit to-
er, the last occasion being in August, 1915, six
ths before Mr. Wallace died. After Mr. Wal-
s return, he received a letter from Governor
rd, which ended as follows: "Said the chief of
Illinois tribe of Indians to Pere Marquette:
sun shines brighter, O white man, for your
ing.' Such is our family message to you."
speaking of Governor Hoard, Mr. Wallace
said: "He belongs to a class now rapidly
ing, who in clear thinking and unyielding
ıfulness to their convictions, have laid broad
deep the foundations for the agricultural edu-
ɔn which the present generation needs."—

⚜

ore than forty years ago Mr. Hoard saw the
ssity for a paper that would give the dairymen
Wisconsin reliable and accurate information.
e that time up till the time of his death, he
worked faithfully in the service of better
ying, and it would not be too much to say that
enviable reputation that Wisconsin has for the
quality of its dairy products, and the pros-
ty that dairymen, as a whole, in that state en-
are very largely due to the helpful and practi-
information given through the columns of
rd's Dairyman.
r. Hoard ever believed that example was better
precept. It was our privilege to visit Mr.
rd's dairy farm at Fort Atkinson some years
, and we found it a model for cleanliness.

Dairymen have lost a true friend and faithful servant in the death of Mr. Hoard.—The Canadian Countryman.

⚜

Governor Hoard was a leader of men. His vision was broad, comprehensive, and clear. He was a great student of nature, possessed unusual powers of reasoning, and arrived at definite, conclusive results. He was always seeking the truth as it applied to his dairy farm and its many problems, and as it applies to dairy farming generally, and to all the farming interests of his state and nation.

No man living has done more for the farming interests of Wisconsin and America than Mr. Hoard, and because of his untiring efforts for many years as a leader, Wisconsin stands first in the nation today as a dairy state.

Governor Hoard was the founder of the Northwestern Dairymen's Association and its president. He organized the Wisconsin State Dairymen's Association; was its first secretary, later its president, and a life member of its executive committee.

In 1873 he helped organize the Watertown Dairy Board of Trade, and it was Mr. Hoard who secured for Wisconsin a low freight rate on cheese from this state to the Atlantic seaboard and the use of refrigerator cars in which to ship the cheese.

He has been often honored by the people of his state. He held many positions of trust and has been obliged to decline acceptance of many others. —The Wisconsin Agriculturist.

⚜

A commanding personage in his own state he was known the nation over as the founder and senior editor of Hoard's Dairyman, published for many years at Fort Atkinson, Wisconsin, in the interests of the dairy industry. Governor Hoard was a pioneer in helping to make Wisconsin the prominent dairy state it is today. He labored for the development of that section and for the people whose prosperity rests upon the dairy business, not for personal advantage but for the public welfare. He was a man of vigorous opinions and sound sense, and generally speaking he was one of those forward looking men whose monument is the service he rendered mankind and the grateful memory of those who benefited by his having lived and worked among them. A prominent place in the temple of fame is reserved for Ex-governor Hoard, farmer, writer, thinker, publisher, and statesman. —Farmer and Breeder.

⚜

A great man; a benefactor of his race; a man of whom the late Henry Wallace said: "He belonged to a class now rapidly passing who by clear thinking and unyielding faithfulness to their convictions have laid broad and deep the foundations for the agricultural education which the present generation needs." Of his paper an admirer said only the other day: "While maintaining its reputation as a leading farm and dairy paper, it has not been content to print just what its subscribers want to hear. For instance, it has frequently decried the folly of spoiling a good farmer to make a poor business man." Both Hoard and Wallace left sons to come after them, worthy to continue their work and add to their benefactions to their countrymen; in which respect both were happy beyond the lot of most men.—The Price Current-Grain Reporter.

⚜

William D. Hoard's name was a household word —not only among country people, but with many whose homes have always been in town. At his death many of the large daily papers, which usually know little and care less about farm matters, printed very appropriate and appreciative studies of Mr. Hoard's life and character. Perhaps the best of them came from the New York Sun, and we can hardly do better than quote from it:

"On the roster of men to whom we owe the modern development of dairying, the name of William D. Hoard of Wisconsin, who died at his home in Fort Atkinson on Friday, will always have a high place. He was one of the first Americans to recognize that disaster must follow the robbery of the soil, one of the earliest to ignore the long cherished opinion that organization of farmers was not feasible, and one of the pioneers in the crusade for modern and enlightened methods in the cow barn and the pasture.

"Modern scientific dairying, with its intricate machinery and exact records, rests on the Babcock test, and Mr. Babcock, after years of study of the chemistry of milk, butter, cheese, and other milk products, and the intimately associated problems of cattle feeding for the sustenance of the cow and high production of rich, wholesome milk, completed the tester in 1890, not quite a generation ago. Mr. Babcock and Mr. Hoard were both natives of New York, always one of the greatest agricultural and dairying states of the Union. Mr. Babcock was born in Bridgewater, Oneida county; Mr. Hoard came from Stockbridge in Madison County. The inventor of the Babcock test had the advantage of a thorough academic training; Mr. Hoard, who was Mr. Babcock's senior by seven years, had to get along without this early advantage. But though Mr. Hoard lacked the training Mr. Babcock put to such distinguished use, his intellectual horizon was always a wide one, and he was mentally equipped for the task of leadership his disposition and the circumstances his interesting life brought to him.

"It is conceivable that no university instructor, no matter what his attainments in his specialty, could have done what Mr. Hoard did. Primarily, fundamentally, and continuously a farmer, his writings and his addresses were the expressions of intelligent concern for the farmers. He talked to them as one of themselves, not as a missionary from an alien sphere.

"Mr. Hoard lived to be 82. He lived to see the principles of farm management for which he contended in the face of thinly veiled distrust adopted without question. He had the satisfaction of being a prophet honored at home and held in esteem abroad.

"The salvation of the nation, the peace of the world, depend absolutely on the production of food. The most alarming incident of American life has been the abandonment of agriculture for other industries. The most hopeful national tendency now observable is the intelligent effort to which so many agencies, public and private, are contributing to re-establish agriculture on the plane on which it belongs. This is not to be brought about by sentimentalists, by ill-considered "back to the land" movements addressed to persons incompetent to plow a straight furrow, but by hard-headed, businesslike study of the problems of farming, by the employment of every aid science can bring to the cultivator and by the elimination of bad practices in farming. To this, men like Mr. Hoard are the most potent contributors and thus true benefactors of the race."—The Rural New Yorker.

⚜

As the governor of his state, as the editor of Hoard's Dairyman, and as a private citizen, Governor Hoard wielded an influence such as is granted to very few men. Standing always for constructive development in agriculture, Governor Hoard was privileged to round out his eighty-two years of life by seeing the fulfillment of most of his prophecies and ideas with regard to agricultural progress. In fact, his vigorous and persistent advocacy of the principles of modern dairy practice in a large degree made possible the present status of the dairy industry. No one man ever made a larger contribution to the agricultural age in which he lived than did Governor Hoard and thousands of successful dairymen owe their progress and prosperity to the leadership of this great teacher.

Governor Hoard was not only a great agricultural leader and a great editor, but he was also a great citizen, a leader in the affairs of his state and country. In all of his activities he exercised that keen judgment and common sense that made him a leader among men. His circle of warm personal friends extended to all sections of this country and it was said of him that "he never failed to win a friend, and never lost a friend once made".

In the memory of his friends, in the dairy world, in the history of his state, and in the broad activities of life, Governor Hoard builded a monument of service and friendliness that will endure for all time. American agriculture would not be what it is today had it not been for the work of such able and far-visioned men as Governor Hoard.—The Farmer.

EDITORIAL COMMENT

CHRISTMAS GREETINGS

This is the most joyous and happy Christmas season the world has ever known. For more than four years millions of soldiers have bled and died that the world might live in peace; devastation and starvation have been rife in many nations and the hearts of women and children have been crushed with grief. The ominous tread of the warrior is heard no more, for peace has come. The step of the soldier now means love and protection. Out of the carnage of war is rising a new earth and a new heaven. The long period of suffering has made peace sweeter and dearer to the peoples of earth than it has ever been before.

Right has triumphed over might, and mercy and tenderness are not ridiculed but are reverenced and honored. It has been demonstrated that brute force is not the great power in the world, and the people again trust in Him who created the heaven and the earth. Christ was crucified on the cross because he declared that the rights of people were divine; because he preached love, tenderness, and mercy, and because he advocated justice. The kings then, as the kings of yesterday, believed in the divine rights of kings and not in people; they believed in force and not in justice, love, and mercy. While Christ was crucified, His spirit has been guiding the minds of men for nearly two thousand years. It was through His teachings that the world was saved for democracy and that right was victorious over might.

The Christmas spirit which broods over land and sea has a deeper meaning to the world than it ever had. Its meaning and purpose have been branded by hot steel upon the hearts of all men, and especially those who were actively engaged in war. May we all at this Christmas season reflect upon its significance and try to appreciate what kind of a world we would have if the Yuletide spirit had been crushed to earth.

As we suspend for a moment selfishness and strife let us open our hearts that there may flow in the true meaning of the Christmas spirit and that we may appreciate the full importance of "Peace on Earth and Good Will to Men".

THE COUNTY FARM BUREAU

Peace has brought us the problem of readjustment of all our industries. Agriculture is not to be the exception, as it plays too important a part in the affairs of the nation to be left out of the great scheme of readjustment. Farmers everywhere are fast learning that individual effort is not going to meet the requirements of their business, for they must meet organized industries on every hand. These men appreciate that if agriculture is to protect its rights and is to be placed in the proper relationship to all other industries it must adopt the universal plans and practices of organization.

The county farm bureau, which had its inception a few years ago, is growing in number and in influence. In the beginning it was an organization of the representatives of the various industries of a county to raise funds to defray the expenses of a county agent and to concern itself with county agricultural problems. It has now become, in most instances, an organization of the farmers in a county and it co-operates with the county agent in conducting the agricultural affairs of a county. The county agent in most cases now receives his salary and expenses from appropriations made by the county, state, and federal governments. The county agent holds no office in the county farm bureau, but helps to direct and carry on the work of the bureau. He is the paid servant of the county and willingly co-operates with all organizations of the county, for through them he can do his most effective work.

The war brought forth a county agent or a county food emergency agent in nearly every county in the United States. The county food emergency agent will disappear, but we expect and hope that every agricultural county will employ a county agent. We do not believe agriculture can be effectively organized and conducted without regularly employed and paid servants. The county agent should become the leader of agricultural activities of a county, if he is the right kind of man, and as such he can bring together the various and special organizations, such as corn clubs, boys' calf clubs, etc., to work with the county farm bureau in matters of general importance to agriculture. The county agent in assisting in the work of these various associations becomes indispensable, for few farmer organizations have succeeded unless there was some directing force constantly and everlastingly on the job.

Through the county agent such organizations can be extended until every county that has a county agent will have a county farm bureau and its natural auxiliary associations. The county farm bureaus can be federated into a state organization and the states into a national organization.

The county agent has in many instances confined his efforts to the problems of production, but through county farm bureaus his activities are extended to all matters pertaining to agriculture, including the marketing of farm products, the organization of co-operative enterprises, assisting in social and economic functions, etc. The opportunities for service in this field are unlimited and we believe necessary to bring about a proper organization to cope with the problems of agriculture.

HOW THE FARMER ANSWERED

"The farmer will not buy bonds, he will not fight." This absurd charge of a truculent banker is well answered when the balance sheet is made up showing the farmers' participation in the war.

Just how many bonds he has purchased we do not know, but agricultural Iowa went over the top quickly and without the blare of circus bands and vaudeville acts. Despite their large war earnings and their big noise, the industrial East lagged behind their country cousins. It is also now known that the farming people sent a relatively larger proportion of its young men into the khaki clad ranks than any other trade or profession. If we are correctly informed, one-third of the boys who pledged their all to the service of their country and humanity came from farm homes, but father and mother have carried on.

Let us assess, for a moment, just what more the farmer has done. What do the agricultural statistics show? In the pre-war period the American farmer planted 209,036,000 acres of the ten important food crops—corn, wheat, oats, barley, rye, buckwheat, rice, potatoes, sugar beets, and sorghum. If to these are added his acreage of cotton, hay, tobacco, and flaxseed, he has to his credit 313,723,000 acres. In 1914 he increased his acreage of food crops 2% over the pre-war period; in 1915 and 1916 he increased it 8%; in 1917 he increased it 17%; and finally in 1918, despite the men he gave to the army and to higher paid industrial work, he increased his 5-year pre-war average by 18 per cent, having planted 246,475,000 acres of food crops and at the same time increasing his cotton, hay, tobacco, and flaxseed by 13½%.

Yes, the farmer has "come across". He has "carried on". It needs no invidious comparison with any other business or profession, for he has done more and better than could have been reasonably expected. For the future he will demand, and rightfully, a proper and adequate price for the product of his labor. Whether he is or is not in a better financial condition than four years ago is a matter of considerable argument, but consumers may as well realize now that in the future his exertions to produce will be dependent on the returns he can secure. He is still a patriot, but now that the nation's immediate necessities have been met, he will give more consideration to the condition of his pocket-book than to the world necessities for food.

STARVING COWS FOR PROTEIN

We find many dairy farmers feeding rations low in protein this winter. It has come about in this way. The price of protein appearing rather high leads these men to prepare for their cows home grown rations consisting of silage, timothy hay, oats, corn, and barley. If a liberal allowance of corn silage, timothy hay, and 8 lbs. of a mixture, equal parts by weight, of ground oats, corn, and barley are fed daily to a cow, she will be supplied with just about enough protein to produce 15 lbs. of average testing milk. A cow in reasonable flesh will draw upon her body and produce more milk than this for a short time, but the protein in the ration is so low that her production will ultimately fall to 12 to 15 lbs. of milk a day.

There is no profit in this sort of feeding and the reason a cow does so poorly is because the ration lacks in protein. If these farmers would feed a pound or two per day of some feed rich in protein like oil meal, cottonseed meal, gluten feed, distillers grains, etc., the cow with roughage and 7 or 8 lbs. of grain could produce 25 lbs. of milk instead of 12 to 15. Further, she would sustain her milk flow longer and remain in better physical condition and produce a stronger calf. It is not wise to limit a cow in the amount of protei receives as it is impossible for her to pr profitable flows of milk unless this element i plied in abundance.

Some farmers have purchased large quantit oat hulls, which is a feed low in nutrients. oat hulls were purchased because they were with other feeds and sold for about $25 pe We have found rations, where oats hulls ma the larger percentage of the meal po that did not contain enough protein to duce over 9 or 10 lbs. of milk daily. It is no der these dairymen complain that there money in dairying. There are many good feeds on the market and most of them have a It is not wise for a dairyman to buy a feed be it is cheap or rich in carbohydrates wh has nothing but corn silage and timothy h feed with it. If he has clover and alfalfa hay such a mixture is advisable, but with timoth and silage a mixture rich in protein is requi

A dairyman should first find out what fee needs to balance his ration with those he has farm and then proceed to buy the feed in the ket which will meet his requirements. It s ever be borne in mind that in order to produ eral flows of milk, a cow must be supplied w adequate supply of protein. If it is not provi the roughage portion of the ration, that is, ha the like, it must come in the meal portion should also be borne in mind that a mixture will supplement alfalfa hay will not suppl timothy hay. It seems strange in this age there are such opportunities for securing inf tion regarding the balancing of rations that men can be found everywhere, especially this starving their cows for protein.

STRENGTHENING OUR FOUNDATIONS

Agricultural America has learned many l during the war, not the least of which is the of organization. That she was able to fe world was due, in the first place, to the pa devotion of her farmers as they bent their ba the task. However, even with this we woul failed had there not been organization and tion. Three days after the declaration of Secretary Houston met the agricultural ext workers at St. Louis and this conference dr a program of food production and conser that was shortly adopted by congress.

In this program definite consideration was to the perfecting of the organization of ou cultural agencies. The agricultural extensio vice was made a permanent and nation wid tem, and it has so developed that President recently described it as "the greatest practic scientific agricultural organization in the w Congress was sufficiently impressed that it n special and additional appropriation of ove million dollars, so that in 1917 the total available for agricultural extension were million dollars and in the present year million dollars. This latter sum is made $6,200,000 as the national war emergency priation, $4,680,000 from the operation Smith-Lever Act, $2,500,000 from countie the remainder largely from agricultural co

These appropriations have provided for a expansion, which is indicated by the fact t April 1, 1917, there were 2,149 extension w of whom 1,461 were county agents; on J 1918, this number increased to 6,216, which i ed 3,001 county agents, 2,034 home demonst agents, and 1,181 boys' and girls' club wor

We are now entering a period of contr in expenditures and there is danger that th cultural extension movement may suffer unl friends bestir themselves. Not only must Co be assured of the value of the county agent a other extension workers, but the local fa reau should be strengthened and local sen crystallized that it may be solidly back movement for strengthening the foundation agriculture.

We take it that there is little need to arg value of the county agent. His usefulness a accomplishments speak for themselves. quick expansion of the movement doubtless weak men have found place, and in so doin in part discredited the work in their particula munities. As conditions again become norma will be more competent men available, and a goes on we hope to see the day when every will have a strong farm bureau organizatio will employ a trained man as their county In thus particularizing the county agent, not intend to slight the value of the other sion workers. of grain a hog would require to attain to
um weight of 200 lbs. under these condi-

ukee, Wis. N. L. G.

rse, we must emphasize at the outset that
ie grain supplements we have—whether
pplements be meat meal tankage or oil
wheat middlings or alfalfa pasture or red
sture or rape pasture or what not—that
test of all is whole milk and that the next
is skimmilk or buttermilk. Of course, we
ed the whole milk because it is too expen-
we can feed skimmilk and buttermilk to
and when we do so we know that we are
a supplement par excellence.

er, it is entirely possible and feasible and
to make 200-lb. pigs at 8 months of age
ny milk whatsoever but we think it is a
er to make them weigh that when we have
ilk.

e you some idea right along the line of
respondence, would submit some of our
e.

ar we had a group of pigs on pastures of
These pigs were fed throughout the winter
nd tankage or corn and alfalfa hay. We
these rations give good results at farrow-
and that the pigs come strong and hearty.
ie suckling period the mothers were given
run on pasture and in addition a little
l was allowed.

these pigs were 2½ months old, without
f any milk, they weighed 55 lbs. They
fed on until they reached the weight of
which is 25 lbs. more than your corres-
asked for. Remember, now, that these
practically 75 days old, but to be fair let
them 80,—the exact figures run right
ese two figures. How many more days
ake to make 225-lb. hogs out of them?
take the best fed group, namely the ones
falfa pasture at that age and fed, in sep-
-feeders, "free choice" style, meat meal
They took 121 days to reach the above
hich added to 80 days makes a total of
or practically 6⅔ months. Here, then,
igs reaching the weight of 225 lbs., which
more than your correspondent asked for,
months less than he allows for a 200-lb.

d required for 100 lbs. of gain was re-
342.7 lbs. of shelled corn plus 31.7 lbs.
neal tankage, plus .05 lb. of salt, a total
bs. of feed, in addition to the alfalfa pas-
ordinarily figure that an acre of alfalfa
at will yield five tons to the acre, as it
nd here, will carry about 15 to 20 pigs to
nd in addition hay cuttings may be made.
ie last year for alfalfa and we wish
it to the limit, we have used as many as
the acre, but the former method of pig
nd hay cutting is the most profitable.

similar group of pigs started at the
out of the same sires—litter mates in
on dry lot on shelled corn, meat meal
nd salt per "free choice" style, self-fed,
days but they ate somewhat more corn
derably more tankage or 354.2 lbs. of
100 lbs. gain in addition to 50.6 lbs. of tankage. They also ate .05 lb. of salt. This makes a total of 404.8 lbs. of feed for 100 lbs. of gain.

But notice that practically 19 lbs. more of tankage was required for 100 lbs. of gain than on pasture; in other words, the alfalfa pasture saved tankage, also it saved 9 days' time to the pig and it saved corn. These are important considerations and they are to the point in the answering of the propositions set forth by your inquirer.

It is difficult to answer satisfactorily the latter portion of this letter of inquiry.

We believe that the pigs best adapted to the corn belt are those that have considerable stretch and development in them; in other words, we prefer the kinds of pigs that approach the bacon type but yet have many of the lard tendencies. Such pigs can be found in practically all of the leading breeds.

Cross-bred pigs, of course, do finely but one gets into difficulties in keeping up a cross-bred herd unless he maintains pure-breds both on the female and male side. This is difficult. Cross-breds, however, are generally more vigorous than the pure lines but they cannot be used successfully because of the difficulties mentioned unless, of course, the swine operator operates on a very large scale.

From the time the pig is farrowed until he goes to market weighing 200 lbs. he should be able to make gains to 200 lbs. at an outlay of around 300 to 500 lbs. of feed for every 100 lbs. put on. One would have to add to this, of course, the feed fed to the sow during the period of breeding and gestation in order to get the total feed requirement. Some of our farm management figures in this state made by Munger and Lloyd indicate that for every 100 lbs. of hog marketed from the farm, there is represented an outlay of practically 473 lbs. of grain plus 49 lbs. of skimmilk, both of which are concentrated feeds, but these are for average hogs as marketed from the average farm, including discarded brood sows, pigs, boars, and so on.

Iowa Experiment Station. JOHN M. EVVARD.

Calf Stomachs for Rennet

I am informed that rennet is used in the manufacture of cheese and that it is obtained from the stomachs of young calves. As I will have quite a few veal calves to dispose of during this winter I would be pleased to have you advise if there is any market for these stomachs and where. I would be glad to have you advise also, how to prepare the stomachs for market.

Lone Rock, Ia. L. B. H.

Professor J. L. Sammis, who is in charge of the cheese work at the Wisconsin College of Agriculture, sends us the following reply:

"It is very important that all calves' stomachs be saved and utilized for the manufacture of cheese. The easiest way to do this in Wisconsin is to write to the Marshall Dairy Laboratory, Madison, Wisconsin, for directions for preparing calves' stomachs for this purpose. This firm buys calves' stomachs from all over the country and manufactures rennet extract in large quantities. It is the only factory making rennet extract west of New York State. Calves' stomachs bring high prices now and it is of the utmost importance that none of them be wasted, as they are all needed to help keep our cheese factories running."

Repairing a Tile Silo

May I use your columns to inquire of your readers what information they can give concerning hollow tile silos? I have been told that the acid in ensilge eats cement in which tiles are set and my own experience tends to confirm this as a fact. The first two years I had no trouble of this sort, but then the ensilage put in was too dry. This year, however, it was in prime condition and very juicy, but almost immediately the succulence began to pour out through innumerable tiny holes between the tiles. As fast as these were plugged up and cemented over, other leaks would spring. Of course, on outside surface cement will not hold. The main question then is, how to remedy the evil.

Centreville, Md. S. W.

We have little information as to just what may be the trouble with the tile silo but we give below a copy of a reply given by Professor White to a somewhat similar inquiry from one of our readers:

"The reason for silage spoiling in any type of silo is due to either improper filling or porous silo walls. In clay tile silos properly burned, the only possible chance of air passing through the silo walls is at the mortar joints. In some instances the mason who has constructed this type of silo has been careless in not using good mortar or has laid the tile poorly. In some cases, it is due to the tile having such narrow joints that there is nothing to which the mortar can adhere.

"There is no means of painting the inside of a tile silo that I know of which will prevent silage spoiling, provided it is due to poorly glazed tile. A good cement paint, of which there are a number of makes on the market, could be applied at the mortar joints and it ought to make them air-tight. If there is leakage at the joints to the extent that silage juices run out, it will be necessary to paint the joints both inside and out.

"In filling such a silo, it is very essential that sufficient moisture is added so that the silage will pack thoroughly. Special attention ought to be given to tramping the silage near the walls. This will prevent air from entering very far into the silage and as a result there will be a minimum amount of spoiled silage."

Feeding Brood Sows

Please inform me as to the best ration for keeping brood sows in good condition. How much should the ration be increased, if at all, when the sow is about to have pigs? Have blue grass and timothy pasture during spring and summer and rye pasture for late fall. Also have alfalfa hay which might be used if advisable. Is it best to slightly change the ration in winter, for instance feeding more corn to produce more heat?

Sedalia, Mo. L. W. W.

We have found it advisable to feed our brood sows during the winter on a fine quality of alfalfa hay. We make it a point to select the finer portions, the part that is sometimes picked up on the barn floor, and keep that in a rack before them. We supplement this by giving them a little skimmilk. If that does not keep them in flesh, we give them a little corn. The brood sow should not have a liberal allowance of concentrated food, or one that is rich in carbohydrates like corn. If skimmilk is not available, then we would advise a slop made of wheat middlings, to which has been added a small amount of tankage. Roots are appreciated by the brood sow and she will eat considerable quantities of them.

The principle to keep in mind in feeding a brood sow is to give her an abundance of bulky feed but not too nourishing and it should be rich in protein rather than in carbohydrates. Alfalfa is rich in protein and mineral matter and so is skimmilk. This is one of the reasons why our sows do so well when fed this combination.

Wood Ashes for Sandy Acid Soil

Are dry wood ashes a benefit to sandy soil which is acid? And what is best method of applying same? Have a field of rye and sand vetch. Could the ashes be sown to advantage? If so, how many pounds per acre?

Michigan. E. H. S.

Wood ashes contain some calcium and potash which are both beneficial to acid soils. The calcium is valuable in neutralizing acidity, and the potash is needed for plant food. At least 1,000 pounds per acre should be applied, and the best method of application is with a fertilizer spreader. If this is not available, a manure spreader could be used. Do not apply with manure, but apply on the top of the ground after the manure is plowed under, or if in spring it could be applied on top of the ground and then worked in. One harrowing would be sufficient to work in the ashes.

Would not advise applying ashes on a field of fall rye which is above ground as the ashes will have a tendency to burn the leaves. It could be applied on the snow in winter, and the caustic effect of the ashes would thus be neutralized before reaching the plants. One thousand pounds per acre is the least amount of ashes that is worth while to apply.

B. D. LEITH.
Wisconsin College of Agriculture.

Lice on Cattle

Please tell me what to do for cattle that have lice.

Neosho, Mo. E. W. McC.

There is no better way to rid stock of lice than to wash stock thoroughly in a two to five per cent solution of a coal tar disinfectant such as zenoleum or creolin. This should be repeated in about a week after the first washing. The animals should be rubbed dry after washing and then should be blanketed to keep them from taking cold, being especially careful in cold weather.

If the animals are to be kept free from lice the stables should be cleaned up, be thoroughly disinfected, and provision for light and ventilation should be made.

Co-operative Bull Associations

(Continued from page 730)

keep of the bull per cow for eight years will then be $10. The first cost when buying the bulls is $3.33 per cow, or a total of $13.33 per cow for eight years. That makes the total cost per cow each year, $1.66. Compare that with $18.75, the cost for the same service when you buy a bull alone."

"I am interested. Again I see it pays to stop, look, and listen. But it seems too good to be true. Is there not something about this organization that is not so desirable?"

"This organization is like a new machine that is to do things for you that you have been doing with your bare hands. There will surely be some difficulties with the machine that you did not have before. There are now forty-four associations in the United States that are glad to have the troubles of an association that they may have its benefits. It pays to go to a little trouble for a $10 value when you can buy it for $1.00.

"Great as this advantage is, there is at least one other advantage that is greater, and that is the opportunity to try out and discover the exceptional bulls, and when they are found, to use them to the greatest advantage. To the individual this is nearly always lost. This is shown in the case of Aaggie Cornucopia Count 13th that Mr. John Puls of Wisconsin used. When he found out what he was worth he went out to buy him back and found that the butcher had bought him for $50 when in reality he was worth $5,000. This is like selling $100 for $1.00. Similar instances are more numerous than you would imagine.

"There are other advantages too, as, for instance, the greater number of animals of one breed in a community, which is always an attraction to buyers. You do not use as much money in providing bulls in an association as for yourself. This leaves you with more money with which to buy a pure-bred cow. If a pure-bred cow is bought at the time you organize an association it will not be many years before you have a pure-bred herd. With the association in your neighborhood you can depend on the use of a pure-bred bull all the time. It is possible for a man with one cow in the neighborhood of this association to raise a pure-bred calf each year, and what is more the man with one cow will find, at attractive prices, a ready sale in his own locality for the pure-bred heifer calves he raises."

"I am more interested, and I am going home to see what can be done to organize an association; but tell me, how do you arrange for the keep of the bulls?"

"That is arranged by the members of each block. They find one man who will take care of the bull and then agree to pay him a stipulated amount for furnishing all or part of what is necessary to properly care for the bull. The members of each individual block can arrange this to suit themselves with only this condition to observe, that the bulls are the property of the whole association and must be kept according to the requirements of the association. It is in the hands of all the directors to see that the bulls are properly kept and the director in each individual block is held responsible for the proper care of the bull in his block."

"We will have to figure that out for ourselves, I suppose. I have been waiting for you to say something about contagious abortion. Is it not going to spread this disease, having the bulls used in so many herds?"

"That is what so many think when they first hear of this plan; but in reality the bull association makes better conditions. The objection is in the same class with the objection that you undoubtedly have heard put up against the use of ensilage, that feeding ensilage to the cows will rot their teeth and burn out their stomachs. Observations with bull associations show that there is less trouble, if anything, with this disease in bull associations than outside of them. The members in a bull association are working together under the best regulations in their by-laws for avoiding this disease, and it is very apparent that the organized condition of the farmers helps to control not only abortion but also other infectious diseases."

"I feel that this information has shown me a way out of one of my farm problems, and I am glad I came. May we come back with some more questions about how to organize a bull association if we find that there is enough interest in our district to organize one?"

"To be sure, but you may find this information nearer home by going to your state agricultural college. Remember this, however, such an organization does not organize itself. It takes some time to gather up your material and perfect the association; it does not build itself. You may find that your neighbors do not take hold of this matter at once. Some may feel that such an organization may not be practical, but there are 1,000 men in the United States who have proved the bull association to be very practical and successful. They are found in 18 states, and are members of 44 associations, and each association has, on an average, five blocks; and I hope that also you and your neighbors, Mr. Dewitt, will be the beneficiaries of such an association.

"The state or federal extension workers, or both, will give you assistance, if you ask for it; and here are several copies of a sample constitution and by-laws that may be useful in drawing up a constitution for your association. Call again."

Percheron Society of America

The annual meeting of the stockholders of the Percheron Society of America was held December 2nd, at Congress Hotel, Chicago. A goodly number of Percheron breeders were in attendance.

President White in his opening address expressed the deep thankfulness which all Percheron breeders feel in the close of the war. He spoke of the notable service which the Percheron breeders of France and America have rendered to the allied cause, furnishing horses, themselves and their sons, and food supplies, and re-emphasized the fact that food supplies had won the war. He spoke particularly of the lack of fats which, in the judgment of Chairman Hoover of the Food Administration, had lead to a nervous breakdown on the part of the Germans and their associates.

Breeders were urged to weed out rigorously and castrate the inferior stallions and to sell the mares of inferior character as grades to the end that the standard of the breed might be steadily improved. State aid in the form of subsidies to a limited number of high class stallions, to be approved by the stallions boards, was urged. The need for this grows out of the fact that no one farmer owns enough mares to justify keeping a stallion for his own use, and farmers are too busy to stand stallions for public service.

Secretary Dinsmore in his report stated that the registrations made during the last fiscal year were somewhat less than in 1917. 3,881 American bred stallions, 5,226 American bred mares, 63 imported stallions and 10 imported mares were recorded, a grand total of 9,180. 9,798 transfer certificates were issued during the past year and about 2,500 more transfers were embodied in rewritten certificates, or accompanied applications when tendered for record. The transfers were slightly in excess of those of the preceding year. The states, arranged in order, according to number of animals purchased by breeders residing within those states, is as follows: Iowa, 1,526; Illinois, 1,187; Canada, 770; Kansas, 754; Missouri, 618; Ohio, 528; South Dakota, 513.

In the election of directors, William Danforth of Minnesota, W. S. Corsa of Illinois, and Ed. Nicodemus were elected to succeed themselves, and Otho H. Pollock of Ohio was elected to succeed Lewis Slack of Ohio.

At the conclusion of the annual meeting of the stockholders the annual meeting of the Board of Directors was held in room immediately adjoining. President E. B. White, who has served the society during the bitter years of protracted litigation, was re-elected to succeed himself, U. L. Burdick of North Dakota was elected vice-president, C. N. Stanton of Chicago treasurer, and Wayne Dinsmore, secretary, re-elected for a term of three years. W. S. Corsa was elected as a representative from the Percheron society to the National Society of Record Associations.

WAYNE DINSMORE, Secretary.

Creamery Short Course at Purdue

The Creamery Short Course at Purdue University, Lafayette, will be held this year for eight weeks beginning December 30. The purpose of this course is to train men and women in the science and practice of creamery buttermaking, creamery management, market milk, ice cream making, and allied subjects.

There is a great demand for persons trained along this line. Many who are now working in creameries, milk depots, and ice cream plants will do well to avail themselves of this opportunity to better equip themselves in their line of work. The Purdue creamery and laboratories are well equipped with all modern machinery and other equipment which makes it possible to give a thoroughly practical course.

For further information, address Department of Dairy Husbandry, Purdue University, Lafayette, Ind.

Limit Off Lime

The United States Department of Agriculture calls the attention of farmers to the fact that they are now free to buy all the lime needed for fertilizing their soil, unless the state director of extension or other state agricultural official finds it necessary to exercise control of purchases.

The new conditions result from modification by the War Industries Board of its Circular No. 9, which covered the use of lime for agricultural purposes, and which required farmers to apply for permits when they wished to buy more than one ton of agricultural lime in a year.

Wisconsin Dairymen's Association

E 47th annual meeting of the Wisonsin Dairymen's Association at omonie on December 5 and 6 il-ates again: "The best laid mes o' mice and men gang aft ey; And leave us naught but f and pain for promised joy." n County was enthusiastic and program for the meeting was as llent in promise as it was in fulent, but unfortunately the re-oc-ence of the influenza epidemic co-led with and reached its highest t at the time of the meeting. Mr. hes, who had the local arrangets in charge, was one of the unmates, as were also other mem- of the committee.

espite this untoward happening e was a fairly good attendance the meeting will be long remem-d because it followed so closely r the death of its founder and d champion, W. D. Hoard. Presi- McKerrow stated that we met r sad conditions and he missed old faces, but the association held to the spirit of progress as was well exemplified by its founders ly a half century ago. He be-d Governor Hoard to have been a of great foresight, yet he was inced that when he instituted the ement for a Wisconsin Dairy-'s Association he builded better n he knew. He could scarcely have seen that this organization would only become a pattern for other es, but that it should have moth- and nursed to lusty strength the m Institutes, the State Dairy ool, the Dairy and Food Commis-, the cow testing associations, and many other projects that have so ibly proved their value.

his words of welcome L. D. vey, president of Stout Institute, ed that he doubted whether the ational force of the Wisconsin ymen's Association was fully and erly realized. He then referred the organization of the Dairy ool and the other accomplishments he association and the virile men of it. As indicative of what has accomplished he stated that go-with an increase of 47% in cattle, dairy products of the state had led, showing better cows and bet-dairymen as a result of the educa-al forces at work. President Kerrow spoke of the chaotic world litions and paid deserved tribute he dairy farmers who had stuck heir colors despite the giving of r fighting sons, despite the labor city and its relative inefficiency, ite the rising feed and labor ges, and despite the resulting er returns. In explanation of why dairy farmer continued in busi- despite the diminishing returns, stated that Wisconsin farmers e not a shifting class but stuck ugh thick and thin weather. He d that this policy had won in the and his final adjuration was: ck to the line of business you go if you desire to reap ultimate ess."

he Men's and Boys' Judging Con- was under the capable direction Charles L. Hill, who after a short ess adjourned the meeting to the n of the county agricultural ol. Four Guernseys were brought each contestant placing them and ng reasons in writing for such ings. Then four Holsteins were ed in the same manner, and also Jerseys. The animals were rep-ntative and a credit to the breed-who went to no little trouble to ide this feature. The judge's rds were necessarily placed on conformation, and after noting the records of production Mr. Hill reiterated his often repeated statement that the one real way to judge a cow was to keep her record for a year or more. The winners in the men's class were W. W. Kenyon, J. A. Smith, and J. R. Vesper; while the awards in the boys' class went to Walter Olson, Theo. Roswell, and Carroll Harville. There were also several girl contestants, and though no provisions had been made for them a special award was made to Miss Mildred Miller.

The practicability of the milking machine is a matter of consuming interest and those who came to hear Professor C. Larsen of South Dakota discuss this question were not disappointed. His exposition of the subject was practical and illuminating. He held as fundamental that for the successful operation of the machine the cow, the machine, and the operator must work in harmony. The machine will extract the milk if the cow and the operator do their part. He feels that our dairy schools should institute a special course in the elaboration of milk in the cow's udder and its extraction by hand and by machine, particular attention in the latter case being given to the small mechanical details of milkers that so often spell success or failure. Professor Larsen does not believe in pail stripping, suggesting that the machine will milk the cow dry if the udder is massaged. He suggested placing the hands on the sides of the udder, lifting it up three times, repeat the same operation by placing hands at the front and rear of the udder, and then lift up on each cup. This procedure will milk each cow dry and permits the milking operation to be wholly completed at one time. In milking cows nearly dry he massages the udder and attaches the cups when the underside of the udder becomes warm. We expect to publish Professor Larsen's complete address in a future issue.

The cows of Europe have been so underfed and poorly fed that it will take them more than a year to recuperate was the opinion held by Helmer Rabild, who has general oversight of the dairy extension of the U. S. Department of Agriculture. He held that as land becomes more valuable we are moving by necessity to greater dairy product consumption, for the dairy cow is the most economical producer of animal food. He argued for a "profit at the pail" as the only true measure of a cow, therefore he would cull out the poor cows and then use bulls of dairy merit. Mr. Rabild gave many examples of what cow testing associations had accomplished, and we hope to give further space to his excellent address in the near future.

The illustrated lectures by Dr. E. B. Hart of the College of Agriculture were interesting and well received. They followed closely his work as has been heretofore described in the columns of Hoard's Dairyman. At this time we merely wish to point out one matter which he emphasized and which the dairy advocates should not omit. Milk not only contairs certain elements, vitamines, essential to growth, but is remarkable for its excellent proteins and desirable mineral content.

That "cost of production" will never solve the milk price question is the opinion of Professor B. H. Hibbard, who spoke on "The Basis of Milk Prices". He said the "wicked old law of supply and demand" was bound to operate, and though difficult to explain it still represents the truth. The cost of production is valuable for a man to know on his own farm in order to determine how he shall proceed, but is not a reasonable approach to a basis for setting milk prices. He spoke for a better organization of farmers and for their control of the operations incident to the marketing of their milk, for in this way they could be assurred of the fair working of the market demand and have it duly reflected in the price received.

Contagious abortion is one of the outstanding worriments of dairy farming and Dr. F. B. Hadley's discussion was received with interest. He described the causes of the disease, the different methods of treatment, how immunity was gained, and held forth the hope that by introducing the live germs the disease will be produced in a mild form and its ill effects obviated through the immunity thus gained. Dr. Hadley's address was in the nature of a summary of his recent bulletin 296 entitled, "Contagious Abortio Questions Answered." This bulletin may be secured by writing the College of Agriculture, Madison, Wis.

Pastures and good roughages make cheap milk and should be more fully utilized. Laxative rations make more milk but reduce the flesh. Seed rye and rape in last cultivation of corn if you want cheap feed. Most farmers make straw and not hay of clover, its feeding value being lost by the curing process. Do with clover as you do with alfalfa and it will produce as good results. "I would no more dairy without a silo than milk without a cow." "My northern grown Leaming corn will produce from 15 to 20 tons of silage per acre, when planted in drills. It won't have many well developed ears, but it will make lots of milk." "It is expensive to market hay and other roughage, therefore I feed these on the farm and sell my surplus grain." These short quotations from Mr. C. D. Griswold's address illustrate his practice in feeding cows for profit and indicate why he was kept busy answering questions till the president had to call time. We are preparing to make more extensive extracts from his excellent address for publication in the near future.

The sessions of the convention were closed by an address by Mr. E. W. Frost, advocating a League to Enforce Peace. Though pressed for time, Mr. Frost caught the attention of his hearers at once and held them to the close. His remarks were received with applause and a resolution adopted supporting the ideals represented by the league.

The officers elected for the ensuing year are: President, Geo. McKerrow; Vice-president, A. J. Glover; Secretary-treasurer, Paul C. Burchard; Directors: M. Michels, J. Q. Emery, C. H. Everett, and E. C. Jacobs.

The following resolutions were adopted:

Our friend, Ex-governor Hoard, has passed to the great beyond.

While we can but mourn his loss, we are grateful to the good Creator who has spared him through so many fruitful years of help and counsel to us. We are proud that he was a citizen of Wisconsin and commend the judgment of the committee that declared him Wisconsin's most eminent citizen. This association owes its very existence to his foresight and energy and much of its later success to his untiring efforts.

We commend to the dairymen of the state and the world the work of the committee which has in charge the erection of a permanent memorial to him. We feel assured every dairyman in Wisconsin will gladly contribute to the fund that will be devoted to this purpose.

We are particularly proud of Ex-governor Hoard's vigorous, aggressive Americanism. We rejoice that his wisdom in securing the enactment nearly thirty years ago of a statute protecting the language of our country and safeguarding the state against vicious foreign propaganda and his heroic though unsuccessful defense of that law are now recognized and approved alike by former opponents and supporters.

Your committee believes that no other permanent memorial would be so appropriate as a law to be passed at once making it unlawful to teach any foreign language in the grades of either public or private schools, requiring that English shall be the basic language in all schools of the state and that the teaching of any foreign language in any high school or college shall be incidental or subsidiary thereto. Therefore be it

Resolved, That the Wisconsin Dairymen's Association, in convention assembled, urges the 1919 session of the State Legislature to pass such a bill at the earliest possible moment, not only because recent experiences show it to be a wise and necessary public policy, but also because in so doing Wisconsin will honor herself in paying this tribute to the exalted leadership of that distinguished patriot, William Dempster Hoard.

WHEREAS, it is every day more apparent that a large part of the consuming public need a greater appreciation of the value of and comparative cheapness of milk and its products as human food, and because even dairymen themselves need this education, therefore be it

Resolved, That we commend the work of the National and Wisconsin Dairy Councils, and that we urge this latter to be untiring in its efforts to spread the gospel in Wisconsin, especially through the schools; also be it

Resolved, That we thank the state superintendent of public instruction and the University of Wisconsin for their co-operation in the effort already put forth.

WHEREAS, we feel deeply indebted to the people of Menomonie and of Dunn County for their hospitality and attendance at the meetings. Therefore, be it

Resolved, That we extend to them our thanks and appreciation for their efforts in making the meeting a success and especially to the people who favored us with the music.

Resolved, That the Wisconsin Dairymen's Association, in its 47th annual convention assembled in Menomonie, Wisconsin, approves the purpose of the League to Enforce Peace and tenders its support and best wishes for the early accomplishment of its ideals.

Resolved, That a copy of this resolution be sent to the Wisconsin representatives in the United States Senate and House of Representatives.

Indiana Dairy Association Meets

The annual meeting of the Indiana State Dairy Association will be held at Purdue University, Lafayette, Indiana, on January 16th, 1919, in connection with the Annual Farmers' Week. An interesting program including an address by Mr. D. D. Aitken, president of the Holstein-Friesian Association of America, is being prepared and all dairymen of the Hoosier State should attend. Problems of reconstruction and readjustment of the dairy industry will be the central thought of the convention. The dairy industry of the state has been working under war speed and war prices and in the readjustment period it must settle down to normal conditions. It is largely within the powers of the dairy interests to see that in this readjustment the dairy business should not settle into many of the old ruts and wasteful and uneconomic practices but that a firmer foundation should be built on which the industry can rest during future years. It is squarely up to you—men of the industry. With your help it can be done. Come to this important meeting and help start things.

C. R. GEORGE, Secretary.

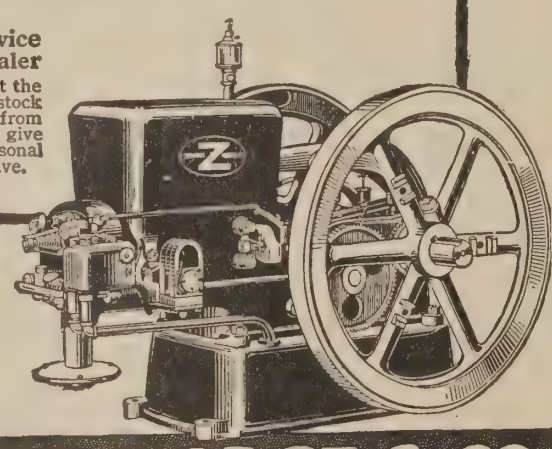
Cow Sucks Herself

My best cow sucks herself. It seems difficult to find any means of breaking her or preventing her doing this. Kindly advise me what to do.

Jacksonville, Fla. T. T. A.

It is by no means an easy task to break a cow from the habit of sucking herself. Several schemes have been devised to overcome this habit, but many cows have been able to get around them. Probably as good a method to follow as any is to put a ring, with two or three links, in the cow's nose. These links will prevent her from getting hold of the teat. Another method is to place a sack over the udder.

The Engine Selected by over 150,000 Farmers



RECORDS made by over 150,000 practical farmers buying over $10,000,000 worth of Fairbanks-Morse "Z" Farm Engines have never been equaled in Engine history.

Demand, as they did:

1. Fairbanks-Morse Quality.
2. Economy in first and fuel cost, and low upkeep.
3. Simplicity and Staunch Durability.
4. Light-weight, Substantial, Fool-proof.
5. Gun-barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

You Also Get Service from your Local Dealer

Your local dealer has just the type "Z" for your needs in stock—waiting for you. Buy from him. He is prepared to give prompt delivery and personal service right where you live.

The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H.P. size uses gasoline only.

FAIRBANKS, MORSE & CO.
Chicago — Manufacturers

You'd hardly know Pete was chewing

Yet he says he gets more satisfaction out of his small chew of Gravely than he ever got out of a big chew of ordinary tobacco. "Real Gravely has a pure, rich taste," says Pete. "It's sweetened just enough, and one small chew holds its good taste so long. I figure that this class of tobacco costs me nothing extra—maybe less than I'd have to spend for ordinary plug."

• • • •

It goes further—that's why you can get the good taste of this class of tobacco without extra cost.

Dairy Dishes

(Continued from page 737)

blespoons of sugar, salt. Heat the buttermilk with the fruit, nuts, cinnamon, and sugar. When boiling add the flour which has been mixed smooth with a little cold milk and thinned with the hot mixture, thus avoiding lumping. Beat while it boils. Serve in hot soup dishes with crisp crackers. The raisins and nuts may be omitted if desired.

CLAM SOUP:—1 quart milk (whole or skimmed), 1 small can minced clam, 2 tablespoonfuls of butter, ½ cup whipped cream, season with salt and pepper. Heat milk, add clams and seasoning, reheat. Serve in hot soup dishes. Put ladle of whipped cream on top. Serve with crisp crackers.

OYSTER STEW:—1 quart oysters, 4 cups scalded milk, ¼ cup butter, 1 teaspoonful salt, 1-8 teaspoon pepper. Clean oysters by placing in colander and pouring over them ¾ cup cold water. Carefully pick over oysters, reserve liquor and heat to boiling point, strain through double cheesecloth. Add oysters and cook until oysters are plump and edges begin to curl. Remove oysters with skimmer and put in tureen with butter, salt, and pepper. Add oyster liquor and milk.—FANNIE MERRITT FARMER.

"THE GREATEST FACTOR OF SAFETY IN THE HUMAN DIET IS THE REGULAR USE OF MILK."

Camouflaging Gives New Life to Meat Substitutes

In the middle of winter when it is hard to get into town, do you ever get tired of eating the same kind of meat day after day? Cottage cheese and Cheddar cheese are splendid meat substitutes and used in the recipes below they give a person that satisfied feeling which always comes after a good meal. Try some of these and see if the family doesn't come back for more.

COTTAGE CHEESE SAUSAGE:—1 cup cottage cheese, 1 cup dry bread crumbs or ½ cup cold cooked rice and ½ cup bread crumbs, ¼ cup peanut butter or 2 tablespoons savory fat, ¼ cup coarsely chopped peanut meats, ½ teaspoon powdered sage, ½ teaspoon thyme, 1 tablespoon milk, 1 teaspoon salt, ¼ teaspoon pepper, ⅛ teaspoon soda, 1 teaspoon finely chopped onion. The bread crumbs may be made from left-over corn, barley, or other quick breads. Cook the onion in the fat until tender but not brown. Dissolve the soda in the milk and work into the cheese. Mix all other dry ingredients thoroughly with the bread crumbs. Blend peanut butter and onion with the cheese, and mix with them the bread crumbs. Form into flat cakes, dust with bread crumbs or corn meal, and fry to a delicate brown in a little fat in a hot frying pan.

Variations—To utilize left over cereals, use one cup of cooked rice, oatmeal, or corn meal mush with ¾ cup of bread crumbs.

Dry corn meal or finely ground oat meal may be used for stiffening the above mixture, but in such case it is better to form into a loaf and bake it in the oven for about 25 minutes. Other seasonings may be used in place of the above.

The amount of liquid will vary in every case. The mixture should be very stiff, since the cheese tends to soften it during the cooking.

COTTAGE CHEESE OMELET:—2 eggs, ¼ teaspoon salt, 3 rounded tablespoons cottage cheese, 1 tablespoon chopped pimentos, 2 tablespoons milk, 1-8 teaspoon soda. Beat the yolks and whites of the eggs separately. Add to the yolks the salt, the milk, and the cheese with which have been blended the pimentos, finally fold in the stiffly beaten whites; pour into a hot frying pan in which has been melted about ½ tablespoon fat. Cook the omelet slowly until the egg has set, place in the oven for a few minutes to finish cooking, and fold over in the center. Garnish with parsley. Other seasoning may be used, such as chopped parsley, green pepper, or minced ham.

CHEESE SOUFFLE:—2 tablespoonfuls butter, 3 tablespoonfuls flour, (1½ corn starch) ½ cup milk, ¾ teaspoonful salt, few grains cayenne, yolks 3 eggs, whites 2 eggs, ½ cup grated American cheese. Melt butter, add flour. Blend well. Pour in milk gradually, stirring constantly. Bring to boiling point, add cheese, salt, and cayenne. Put over hot water and add yolks of eggs beaten until thick and lemon-colored. Cut and fold in the whites which have been beaten until stiff and dry. Cover and cook until firm.

TOMATO RAREBIT:—1 can tomatoes, 1 egg, salt, cayenne pepper, 1 tablespoon butter, ¼ lb. American cheese. Cook canned tomatoes down to half their volume. Cut cheese into small pieces; put all ingredients together and cook over hot water until smooth and thick. Serve on crackers or toast.

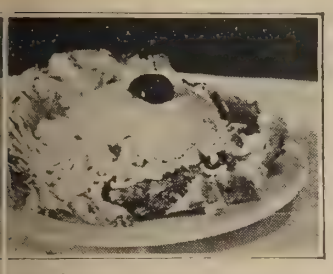
Creamed, escalloped, and au gratin dishes are prepared by cutting in cubes or slices vegetables, meat, poultry, eggs, or macaroni. For creamed dishes add a white sauce made as follows: 1 cup milk, (whole or skimmed) ½ to 1 tablespoon of flour, ½ to 1 tablespoon of butter or drippings, ½ teaspoon of salt. Melt the butter, add the flour, stirring until smooth, pour hot milk over this and cook in a double boiler, stirring to prevent lumping. Pour over the cubed vegetables or meat. Heat thoroughly and serve. Escalloped dishes are prepared as creamed dishes, except a baking dish is used and buttered crumbs are put over the top. Bake until thoroughly done and browned on top.

Au gratin dishes are prepared as the escalloped ones, but grated cheese is added to the sauce and sprinkled in the buttered bread crumbs.

Have you some red apples in your cellar? Wipe and core them and fill the centers with a mixture of cottage

and celery or local nuts. Serve ice leaves and you have an at- holiday salad.

ge cheese, with almost any vegetable, fresh, dried, or fruits, nuts, or olives, makes a s salad and lifts that dinner and potatoes out of its rut.



e cheese cakes make a delicious animent to the salad.

SE CAKES:—2 tablespoons but- tablespoons grated American whites of 3 eggs, 3½ table- flour, ¼ teaspoon salt, few cayenne. Melt butter, add nd stir until well blended. Re- rom range, add cheese, salt, enne. Fold in whites of eggs until stiff. Drop from a spoon ered sheet one inch apart. moderate oven 12 minutes.

ERADISH CREAM DRESSING:— heavy cream, 3 tablespoons , 2 tablespoons grated horse- root, ¼ teaspoonful salt, few pepper. Beat cream until it be- thicken; then add vinegar ly, continuing the beating. stiff, add seasonings and fold grated horseradish.—FANNIE FARMER.

'orget the Dessert Made From Milk

g the past year we have been ourselves dessert. It hasn't quite patriotic to have a sweet end of a meal. The resources farm, however, are such that make dessert a necessary and

UST AS GOOD AS IT LOOKS"— TAGE CHEESE AND APPLE SALAD

part of the meal. Take the plebian cottage cheese and a basis for a dessert which qual. Back on the shelf in the m there must be a jar of preserves. Serve these with cheese, or make it into a pie tch the small boys' eyes grow ask for a second helping.

GE CHEESE PIE:—1 cup cot- eese, ⅓ cup sugar, ⅔ cup yolks of eggs beaten, 1 table- nelted fat, salt, ¼ teaspoon Mix the ingredients in order Bake the pie in one crust. Cool ly and cover it with meringue y adding 2 tablespoons of nd ½ teaspoon of vanilla to ten whites of 2 eggs, then t in a slow oven.—NEW YORK OLLEGE OF AGRICULTURE.

there are custards which are good.

RAL PROPORTIONS:—1 quart eggs, 1 teaspoon flavoring, ¼ p sugar or substitute, ¼ tea- lt. (Yolks may be substituted, yolks in place of one egg.)

neral Rule for Custards

eggs should be thoroughly ut not beaten too light. The nd salt added to these and the milk added gradually.

rds must be cooked at a mod- emperature. Soft custards e cooked in a double boiler. stantly while cooking. When it will be thickened, will coat n, and all bubbles will disap- m the surface. Remove from once to prevent curdling. If d curdles, place in a pan of er and beat with a Dover egg ntil smooth.

stards should be strained, cup custards before and soft custards after cooking.

SOFT CUSTARD:—Scald the milk in a double boiler. Beat the eggs slightly, adding sugar and salt, and pour hot milk into them, stirring carefully. Cook this mixture in the double boiler, with moderate heat, stirring constantly until it thickens. When it coats the spoon and the foam disappears, remove at once from the hot water. Strain and cool before adding flavoring.

BAKED CUSTARD:—Use general proportions and rules, pouring the combined ingredients into custard cups. Set the cups in a pan of warm water. Place all in the oven to bake. Test by placing a knife blade into the custard, if it comes out clean the custard is done.

JUNKET ICE CREAM (Makes 2 quarts):—1 quart milk, 1 junket tablet, 1 tablespoon cold water, 1 pint cream, ⅔ cup maple syrup or honey, 2 teaspoons vanilla. Make the milk lukewarm, stir into it the sweetening and vanilla, then the junket dissolved in water. After stirring well, pour into the freezer can and let stand for 15 minutes undisturbed in warm room. Then pack around with ice and salt and freeze in a thick mush. At this point add the cream and continue freezing until finished.

Surprise the Folks

When that traveling man comes again or when the boys come home, have a surprise for them. If it be in the summer time, offer them cool buttermilk or send some iced whey flavored with a little lemon out to the men working in the fields. Put in a milk dish here and one there and before you know it, the man of the house will be telling about the new cookery to his neighbor and the neighbor's wife will ask you for the recipes.

By using milk and its products in larger quantities you not only have a variety in the diet, but are using an indispensable food, for McCollum says: "The greatest factor of safety in the human diet is the regular use of milk."

Co-operation Solves Dairy Marketing Problems

[Continued from page 735]

such creameries, the greater amount of material having made it possible to fill larger orders at better prices. A number of other co-operative creameries, equally as successful, might be mentioned, but the examples quoted are typical.

Generally speaking, it may be said that the co-operative creameries in Vermont are more than holding their own, and especially so when the management is alert and willing to keep pace with the time. The producers are beginning to realize that by working together and by having their own co-operative organization well managed and large enough to make an impression on the city markets, their interest will be served best.

Those who have studied the subject most are well agreed that not until the farmer's business organizations in general, and the dairy organizations in particular, become as well managed and operated as the organizations in other industries, will agriculture reach the position to which it is entitled. The progress made by the co-operative creamery organizations in Vermont is a step toward that end and very encouraging indeed. It not only is beneficial to the farmers in helping to solve their dairy marketing problems, but will be much more helpful now that the war is over.

Those who "get by" and then "stay by" are those who always work—There's nothing to this bluffing, the successful never shirk.—S. FISHER.

DISSTON

SAWS AND TOOLS

Buy W. S. S. Regularly

The Saw Most Carpenters Use

Buy Your Saw Like The Carpenter Does

There is no reason in the world why the farm tool kit should not be just as good as the carpenter's.

There is a big difference between a good saw and a poor one and there is a big difference in the sort of work they turn out.

The difference in saws doesn't show on the outside—it shows in the way they work.

If you buy your saw the same way the carpenter does, it will do the work as well as the carpenter's saw.

Buy it by name—Disston. That is all you need to know. Quality *does show on the outside* of a Disston Saw. It is stamped on the blade and it is spelled like this—"Disston." Look for it. It is your guarantee.

Association Notes

Lake County, No. 2, Illinois:—This association started its second year's work with seven new members. Three of last year's members were transferred to the new association called Lake County No. 3. Three unprofitable cows were sold and two pure-bred Holsteins were purchased. In November market milk sold in this community for $3.68 per cwt. The average test required was 3.5%, and for each point above 4 cents were paid.

Lake County, No. 1, Illinois:—A few unprofitable grades were sold during the month and four pure-bred cows were purchased. The members are becoming more interested in pure-bred live stock every day and are showing a tendency to change from grades to pure-breds. In November market milk sold for $3.68 per hundred pounds, the average test being 3.5 per cent. Four cents were paid for each point above. Feed prices: Alfalfa, $32; bran, $38; oil meal, $66; ground oats, $40; ground barley, $45; gluten, $59; clover hay, $30.

Stillaquamish, Washington:—Members of the co-operative bull association purchased through the county agent seven pure-bred Guernsey cows of Langwater breeding. The dairy association is continuing in this section and promises to be of great assistance to the dairy farmer. Milk sold for $3.50 per hundred pounds in November. The average test required was 3.7% and for each point above, 8.76 cents was paid. Milk retailed for 13½ cents per quart. The condensery paid 87.6 cents per pound fat. Butter retailed for 70 cents per pound and cheese 35 cents per pound. Mill run cost $35 per ton; barley, $45; oats, $65.

Arkansas Valley, Colorado:—During November cows were turned out on alfalfa pasture. Besides this, beet pulp and beet tops have been fed. Cows have given good returns for the extra feed. The monthly milk flow shows an increase over last month of 85 pounds per cow. This month 14 cows produced over 40 lbs. fat compared with four in October. Market milk sold for $3.68 per hundred pounds, the average test required being 3.5%. Three cents were paid for each point above. The creamery paid 58 cents per pound fat. Milk retailed for 12½ cents per quart; butter 60 cents per pound. Feed prices: Alfalfa hay, $18 per ton; corn silage, $8; green beet tops, $6; beet pulp, $2; corn, $3 per cwt.; barley, $2.50; bran, $1.35; headed maize, $2.

Pioneer, Minnesota:—In November the creamery paid 71 cents per pound fat. Milk retailed for 12½ cents per quart and butter 72 cents per pound. Hay sold for $10 to $15; silage, $4 to $5; corn, $40; bran, $31 to $34; oats, $40; oil meal, $59 to $63.

West Bend, Wisconsin:—Four cows were sold for beef. Much improvement has been made in feeding by using balanced rations. In November the condensery paid 91 cents per pound for fat, the creamery paid 89 cents, and the cheese factory 89 cents. Butter retailed for 71 cents per pound and cheese 35½ cents. Feed prices: Oats, $44 per ton; bran, $37; Climax, $38; oil meal, $58; gluten feed, $58; hay, $35; barley, $40; middlings, $38.

New York Butter Market

NEW YORK CITY, DEC. 10:—While the record for prices of butter has again been broken during the past week the market is at present very nervous and fairly inactive. While many dealers have been predicting the seventy-cent mark for extras at some time during the fall or winter there were many more who felt that the consumer would not stand for such a price. However, that mark was reached yesterday but it was too high to stand as there was a decline of a full cent today. The week has presented a peculiar condition. After the decline which developed about ten days ago buyers were not interested in adding to their stocks as they sensed a further decline in values, but in that they were mistaken. While the quotation 67½@68c held from Tuesday of last week until the following Saturday there was an advance of a full cent on that day and the quotation 69c for extras became established. That was followed by the 70c quotation on Monday with the setting of the record price to date in the history of the butter market.

If the present condition of the market were considered singly there would be a marked lowering of quotations as retailers are hesitating before buying because of slightly increased receipts and because of the consumers' attitude. The consumer, in slang phrase, is backing up. Prices are causing him to cease purchasing butter and he is using substitutes. But in spite of his attitude and regardless of the fact that receipts were about 3,000 tubs greater today than yesterday, which were about the average for this season, there is no indication that values will go down to any marked degree. Receivers are constantly being advised that there will be a very great shortage of butter during the next few months as the make is shrinking each week and they believe it is best to prevent as much as possible the zigzagging of prices. While receipts were comparatively heavy today it has been found that much of the butter received was shipped to fill government requisitions and consequently would have no effect on the general market. Several cars of California butter have been received of late and have quickly been absorbed.

At the close today established quotations were as follows: Extras (92 score), 69c; higher scoring than extras (93 score or above), 69½@70c; firsts (88 to 91 score), 63@68c; and seconds (83 to 87 score), 58@62c. Unsalted butter is in somewhat less demand and the differential in price has been decreased to one cent over quotations for corresponding grades of salted butter. The quotation for extras one year ago today was 49@49½c. W. B. LIVERANCE.

The Tri-State Grain Growers' Convention

The twentieth annual meeting of the Tri-State Stock and Grain Growers' Convention will be held at Fargo, N. Dak., January 14 to 17. One of the principal addresses will be by W. O. Thompson, President of the Ohio State University. Mr. Thompson has been in Europe studying agricultural conditions and will take up the subject "After War Agriculture". There will be addresses on nearly every phase of agriculture by some of the best authorities.

After Calving

Every Cow Should be Treated With

Hood Farm Breeding Powder

It cleanses, disinfects, causes the cow to clean quickly and breed readily. It is a safeguard against Abortion, there is less use of the bull, and calves are stronger.

We quote what Mr. H. F. Weaver, of Millard, Wis., says:

"I have used your Breeding Powder for about four years with very good success. I think if every dairyman made a practice of injecting every cow three or four times after calving there would be very few barren cows."

Treatment of all cows with Hood Farm Breeding Powder is the most profitable and economical thing you can do.

Mail an order today, mentioning this paper.

Prices, prepaid, $1.15, $2.75 and $5.00. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75.

Minnesota Live Stock Breeders Meet

HOARD'S DAIRYMAN:—The annual meeting of the Minnesota Live Stock Breeders' Association will be held January 2 during Farmers' Week at University Farm. The program has been prepared so that the most important problems confronting the live stock breeders of the country will be presented.

Mr. R. J. Kinzer of Kansas City, one of the most widely known beef cattle specialists in America, will deliver an address on the present and future status of the beef industry.

W. W. Marsh, Iowa, will deliver an address on National Needs and the World's Food Problem. We are very fortunate in procuring the services of Mr. Marsh as he is one of the best informed men along these lines and every farmer in Minnesota should hear him.

Mr. D. D. Aitken, president of the National Holstein Association, will present facts concerning the farmer and dairy products in the future.

Alex Galbraith, of Canada, one of the oldest breeders and importers of draft horses in the world, and probably as well posted on the possibilities of the horse industry as anyone in America, will attend the meeting and present the future of the industry as he sees it.

On January 3 the dairy cattle breeders' associations will also meet at University Farm. Dr. W. L. Boyd will address all of the meetings on contagious abortion disease. Mr. D. D. Aitken will address the Holstein breeders and other speakers will present certain phases of breed problems.

The Minnesota Guernsey Breeders' Association will be fortunate in having Mr. Marsh with them. A very interesting program will be prepared. The State Ayrshire Association will receive the most recent findings regarding their breed from the efficient secretary of the American Ayrshire Breeders' Association, Mr. J. G. Watson.

The Minnesota Jersey Breeders' Association will also hold their annual meeting on the third. Mr. M. D. Munn and other prominent Jersey breeders will take part in the session.

There never was a time when live stock and dairy farmers should be preparing for the future with greater thought than at present.

W. A. MCKERROW, Secretary.

A Worth While Pig Club

HOARD'S DAIRYMAN:—The Hamilton Pig Club, Hamilton, Missouri, was organized last winter, and on January 19th, 1918, 28 bred Duroc-Jersey gilts and 34 bred spotted Poland-China gilts were sold to the boys and girls of Caldwell County for $2,846.58. The banks of Hamilton gladly loaned the young folks the money to purchase their club stock. Each member was permitted to purchase only one gilt. The above 62 head of sows and their pigs were sold at public auction on November 9th for a total of $13,171.50, making a gross profit over original cost of the bred sows of $10,324.92.

The success of the Hamilton club was due in a great part to the happy co-operation of the business men, farmers, county agent, and the Missouri Boys' and Girls' Club Department. Everybody worked toward the development of the community. In order to make the work mean more to all parties concerned the members were asked to keep accurate records of their work through the season. The record books and club literature were supplied by the Agricultural Extension Service of the College of Agriculture, Columbia, Missouri. The county agent of Caldwell County has this to say of the results of the work:

"If folks could only see some of the records of those boys and girls who had pigs in the club at Hamilton the last week it would convert them for all time to come. Those little farmers of the next generation have done things which will make some of our 'moss backs' either hump themselves or else get out of the way and let some real farmer have room. For example, one boy who was in for a lot of prize money bought a bred gilt last year for $40. He won $28 in prizes and the sow and litter sold at public auction for $495."

Plans for another club for next year are being made and some of the pure-bred gilts have already been purchased. Practically all of the gilts in the 1918 club were registered, and the plans for the club of next year call for all registered animals.

Missouri. F. L. WRIGHT.

January Hog Prices

Two conclusions in the hog situation resulted from meetings held in Chicago, Dec. 4 and 5. It was decided that the price of hogs for January shall be continued on the same basis as in November and December; that is, $17.50 per hundred pounds on average of packers' droves, excluding throwouts. Throwouts are to include pigs under 150 pounds, stags, boars, thin sows, and skips. Also, effective Dec. 5, the shipping embargo will be lifted and free shipping will recommence.

Friends and neighbors, the taxes are indeed very heavy, and if those laid on by the government were the only ones we had to pay, we might the more easily discharge them; but we have many others, and much more grievous to some of us. We are taxed twice as much by our idleness, three times as much by our pride and four times as much by our folly, and from these taxes the commissioners cannot ease or deliver us by allowing an abatement.—Poor Richard, 1757.

Winterthur Farms
OFFER FOR SALE
King Sadie Vale Urma 235352
Born March 30, 1918
Here are the records of his nearest dams:
DAM (two-year-old) ..... *20.04 lbs.*
ONE GRANDAM ..... *38.46 lbs.*
THE OTHER GRANDAM ..... *25.50 lbs.*
ONE GREAT GRANDAM ..... *41.06 lbs.*
ANOTHER GREAT GRANDAM *41.06 lbs.*
The five average ..... *33.22 lbs.*
His 7 nearest Dams average .... *31.27 lbs.*
Like his sire, he is dark in color, long, straight and deep-bodied.
The sire, King of the Sadie Vales, is out of a 38.46-lb. cow. His dam's dam is also his sire's dam, namely: Sadie Vale Concordia 4th (41.06 lbs. butter). His dam and grandam have the highest 30-day averages in the World, 157.71 lbs. butter. No other bull in the World can equal his three to nine nearest dams for 30-day butter production. The sire of King of the Sadie Vales is the only bull in the World with a 40-lb. dam, a 40-lb. sister and a 40-lb. daughter.
The dam of King Sadie Vale Urma recently made as a two-year-old: 20.04 lbs. butter, 399.20 lbs. milk (7 days); 73.26 lbs. butter, 1,571.30 lbs. milk (30 days). Her dam has a 25.50-lb. record, and her maternal grandam has a 26.38-lb. record. She is a granddaughter of Sir Urmagel Burke (three 30-lb. daughters), and a great granddaughter of Pontiac Korndyke (two 40-lb. daughters).
We have put the price on this bull that will put him well within reach of the small breeder. For further particulars, write, wire or come to

When Dad Thought of Selling

"WELL, Mary, that man, Howard, made me an offer on the whole herd," said Mr. Daniels to his wife as he came into the house after saying goodbye to J. E. Howard, a Holstein buyer from another state.

"He offered me $13,000 for the whole outfit, calves, cows, and bull. That's over $230 a head, which is a pretty good price considering the number of young calves there are. Shall I take it?"

"But what would you do, then?" asked his wife. You've spent 10 years building up this herd. You'd be lost without some cattle and it seems almost foolish to sell out and then start right over again."

"I know it, Mary, and I'd hate like sin to part with this bunch. As you say, we've bred them all and now the herd is just where it's really proving profitable. But I don't know how I'm going to hold on for the next year. It isn't a question of money; it's help. I've been trying for three months to get a dependable man and haven't got one yet. There's some testing ought to be done this month and a lot more next. I certainly can't handle it with the other work."

"Well, but Joe, there's the boys to help," she returned.

"Yes, I know, but that is just what I don't want," said he. "I don't want them to neglect their school and they'd have to if they did any more than they're doing now. However, we won't settle it right now. Howard's offer holds good till January 1, and that's a month away. I'm to notify him one way or the other by then."

Mr. Daniels, you must know, was a Holstein breeder located on a 200-acre farm in Central Minnesota. For eighteen years he had been a dairyman and for the past ten he had been breeding Holsteins. He had spared no pains in building up his herd and had done a great deal of official testing until now his was acknowledged one of the best herds in that section.

For the past several months, in fact for a year, he had found it increasingly difficult to get reliable help, something he absolutely needed. The two sons, Ben 15 years old, and Robert 13, had made it possible to get through the summer's work very well, but now they were at school and their father did not want them to neglect that work. He had tried every way he knew to get a man but without success, so he felt that to accept the Howard offer was the best he could do.

That evening at the supper table he brought up the subject again and in response to the boys' questions he told them what he was thinking of doing. They said nothing at the time but the next morning as they were busy at their chores they plainly showed how they felt about it.

"Say, Bob, it wouldn't seem right, would it, to have no cows in here," said the older boy, stopping for a moment beside his brother who was busy milking.

"I should say not. It'll be a darn shame if Dad sells to that fellow," returned the other in no uncertain voice. "Wish the old fool had stayed down in Missouri where he belongs instead of coming around here trying to buy us out."

"Maybe Dad'll change his mind; he's got a month to decide in," said Ben as he moved on.

"I hope so," was the muttered response from Bob.

A little later on their way to school Bob spoke of it again.

"Ben, Dad can't sell the herd. If he does, we might just as well quit the farm. It wouldn't be any fun with the barn empty."

"Well, maybe he figures on buying some more right away," returned Ben.

A PART OF THE BOYS AND GIRLS OF JEFFERSON COUNTY, WISCONSIN, WHO HAVE BEEN DOING CLUB WORK THIS PAST SEASON. THIS PICTURE WAS TAKEN AT A RECENT CLUB ROUND-UP.

"Then what the dickens is the use of selling?"

"I mean maybe he'd buy a few, not any more'n he could take care of."

"Yes, and that would mean starting all over again. All those we've got except the heifers are tested and that means a lot of work, I tell you. Say, Ben," he continued, "Dad and you and I can take care of the whole bunch all right. What's the diff if we do miss school for awhile. I'd just as soon, wouldn't you?"

"Well, no," replied the older boy. "I'd kinda hate to quit school right now, but then we could quit this winter and start again next year. The three of us could do the work all right. I don't think Dad would let us do that though. He's strong for school."

"Guess I know that all right," returned Bob, thinking of the times he had played hookey and then tried to explain matters to his father's satisfaction. "But this is something special. Maybe he'd be willing this time. Let's ask him tonight."

"You do it, Bob," suggested his brother. "He'd say yes quicker for you than he would for me.

"He would not," retorted the other. "But I'll do it anyway."

And he did, too. That night at the supper table he went straight to the point at once.

"Dad", said he, "couldn't you and Ben and I take care of the herd all right, do the testing and everything?"

"Why of course we could," returned his father at once. "However, you fellows at school makes quite a difference."

"Yes, but we could stay out of school for awhile," persisted the lad. "We'd start again next fall and never miss it."

"No doubt you'd be very glad to do it, son, and I don't imagine that you, at least, would miss school at all. However, that's out of the question. You've started school and it's your particular job to finish and finish right. I don't want either of you mixed up in anything that's going to interfere with school and make you neglect your work."

Bob said nothing more. He knew it was useless to argue with his father when he spoke that way. Nor did he mention the subject to his brother, although he had by no means forgotten about it. There must be some way out of the difficulty without selling the herd and if so he was determined to know about it. Bob was not, to be sure, very much unlike other boys of his age. Ordinarily he would much rather play than work in the barn; in fact, there had been times, when he had to work while the other fellows had a good time, that he almost wished the farm and herd were both sold, but now that there was a probability of the herd going, he felt quite different.

For several days he thought about it and said little; in fact, he had his mind on that one thing so much that he neglected his school work to the end that one afternoon after the third sullen "I don't know," Mr. Meiner, the teacher, called him to account.

"Robert, stay for awhile after school tonight and see if you can get this lesson straightened out. For the last three days about the only answer you've been able to give me is 'I don't know.' "

Which is why we find Robert seated at his desk on this particular Thursday afternoon after his schoolmates had gone. For a full half hour he sat there while Mr. Meiner finished some other work that had to be done. Finally he came down and stood facing the boy.

"Bob," said he, "what's the matter? You don't usually act the way you have the last few days. You haven't been studying certainly, because our work isn't very hard just now. Just what is the trouble?"

EARL A. HAYES, A MICHIGAN JUNIOR, IS STARTING IN THE HOLSTEIN BUSINESS WITH THIS PURE-BRED HEIFER WHICH HE EARNED HIMSELF.

"Nothing," was the boy's reply.

"Oh, yes there is, and the sooner we get rid of it the better off we'll both be. What is it; is the work too hard?"

"No, I thought not," he continued as the boy shook his head. "Well, then, it must be that you're tired of going to school. Is that it?"

"No, sir, I ain't just tired of school, but I would like to quit for awhile. We can't get a hired man, and with Ben and me at school all the time, Dad can't take care of the cows as good as he ought to, so he says he's going to sell 'em."

"So that's what's the matter, is it? Well, now, we can't afford to let your father do that. That's too good a herd to let it go somewhere else. You boys help at home morning and night, don't you?"

"Yes, sir, but that's only with part of the chores," returned the boy. "When you've got about 60 head to look after besides hogs and horses, it's quite a job. And, besides, there's testing to do this winter. You can't do all the regular chores and test cows, too."

"I see. Well, now suppose you and Ben could be home part of the time. Would that help any?" asked the master.

"Sure it would. We wouldn't always have to be home. If Ben and I could do more chores and be home a day or two every once in a while when there's special work to do, Dad would take care of the testing and the other jobs."

"Well, then, why don't you do that?" questioned the man.

"Huh," retorted the boy, "Dad won't let us do that. He's afraid we'll miss some of our school work."

"All right for him. But he would be willing if he knew you were getting along in school just the same, wouldn't he?"

'Yes, sir, I think so." Bob was beginning to be interested.

"Good. If that's so, why wouldn't this sort of a plan work all right? You and Ben start just a little earlier in the morning and work just a little later at night so as to be of more help with the chores. Then when special work comes at home, you stay home for two or three days if necessary. So far as your agricultural work is concerned, I will excuse you from that entirely till next March if you'll both do some outside reading

ALBERT DE FIELDS, AN ENTHUSIASTIC JUNIOR DAIRYMAN FROM OHIO, STANDS AT THE RIGHT. WITH HIM ARE HIS FATHER AND HIS YOUNGER BROTHER AND SISTER.

iat I shall select. That work will be ostly dairying till then which is ex-tly what you'll be doing at home. ou know how to test milk and keep ecords, so really most of the work ould be play for you anyway. I iink I can arrange about Ben's ag-cultural work, too."

"Well, but how about our other ork, Mr. Meiner," questioned the oy. "Dad wouldn't let us neglect .at either."

"To be sure he wouldn't, and either would I, nor do I expect to, ou'll only be absent for a few days . a time and by studying at home such times you ought to be able to ep up with your class.

"Wait a minute," as the boy started speak. "This won't be any picnic r you fellows. It will mean hard ork and plenty of it, and it will robably mean giving up some of our good times, but it won't last rever and I think you two boys are en enough to do it. Remember, ough, this isn't settled yet. I'll lk it over with your teachers tonight id if they're satisfied we'll try it out e rest of this month. You go home ow and talk it over with Ben and me to see me sometime tomorrow. ow about it? Are you willing to try is plan?"

"You bet," the boy answered, in-antly forgetting for the moment iere he was. "I'll tell Ben as soon I get home," and he started for e cloak room without stopping to it away his work.

It did not take him long to get me you may be sure. Once there hurried into the house, changed his othes, and got out to the barn in cord time. There he found plenty keep him busy until supper time id it was not until later in the eve-ng when he and Ben were alone at he spoke of Mr. Meiner's plan. ace he understood it, the older other was as much in favor of it as ob. He had, however, one sugges-on to make.

"Bob," said he, "let's not tell Dad mother about it until the end of e month. We can try it and if we ake our December exams all right, en Dad can't object."

"All right. Then if everything orks, it'll be a kind of Christmas esent," proposed Bob.

"Yes, but Ben, suppose Dad decides sell before then?" he questioned.

"He wont; you see," returned the her. "Besides if we dig in and hus-e he won't have any reason to let em go before."

The very next morning at break-st Mr. Daniels himself brought the atter up again.

"Boys, what do you think about sting those three heifers this onth?" he asked. "We ought to put r order in for a tester if we're go-g to get it done at all."

"Why sure, let's test them," said m. "One of them belongs to Bob d me and we'd like to see her have record."

"Yes, I'd like to see them all have a cord, been fitting 'em for it, too. it if I do that, then probably you llows will have to stay home from hool some days and I don't just like at."

"Let's get those heifers tested," id, begged the younger boy. "Ben d I can take care of any extra work at's got to be done. This is the st heifer Ben and I ever had. If u'll let me, I'll milk her and feed r myself."

"No, I won't do that, Bob, because at would keep you out of school too ig, but I will send for a tester and aybe we can get along some way. ke enough there won't be much at'll keep you home anyway."

Both boys secretly hoped there uld be enough to keep them home r several days at least, but of this ey said nothing. At school that morning Mr. Meiner told them they could try the plan for the rest of the month and they set to work at their studies in earnest so as to be prepared for the absence which they were hoping would be necessary. Fortune favored them for once. The tester arrived about the middle of the month and four days later a neighbor had the misfortune to break his arm. He had no man which meant that the Daniels, together with another near neighbor, had to do most of his work. The boys took turns at that and between them managed to lose a week's time from school before their father was through with the testing. Then there was one day lost hauling hay and another helping at home when the wood sawing outfit was there. Besides that, they had more than their usual share of chores to do at home because of other work their father had to attend to, so that altogether they felt that their little plan had had a thorough try-out.

Their monthly exams were over on Friday before Christmas but school did not close until Tuesday night and their report cards were not ready until then. When they came to get them Mr. Meiner stopped them for just a minute.

"Well, boys, how has our little plan appealed to your father?" said he.

"He don't know about it yet," Bob answered. "We thought we'd try it out before we told him."

"Then he hasn't said anything about it at all?"

"No, sir."

"Hm-m. Wait a minute," said the master as the boys reached for their cards.

He sat down and wrote hurriedly for several minutes. When he had finished he folded the sheet of paper and put both it and the report cards into an envelope which he sealed and addressed.

"There you are. Explain our plan to your father tonight and then give him this. Your report cards are inside. Good night and a Merry Christmas to you."

"The same to you, sir," returned the boys as they went out.

Not until after supper did they have an opportunity of saying anything to their father. Then for a time each waited for the other to speak. Finally Bob could stand it no longer.

"Dad," he began, "have you decided not to sell the herd?"

"Well, not exactly, boy. I was just thinking about it as you spoke. We surely got along all right this month, even with the testing, Benson's bad luck and all, but you fellows were home from school too much I'm afraid."

"That's just what we wanted," said Ben. Mr. Meiner said he thought we could make up what work we missed and he said he'd excuse our absences if we'd do all right. He's fixed it so we can be excused from agriculture class part of the time because he says when we have to stay home we're studying dairying more'n when we're in school. We figured we could do more work at home and could do the school work, too, and then you wouldn't sell."

"So that's what you've been up to lately, is it? Well, how about your reports this month?"

"Here they are," said Bob handing over the envelope. "We ain't seen them yet."

Mr. Daniels hastily tore it open, looked over both cards and then read the enclosed note. Here it is:

Dear Mr. Daniels:

Just a line to tell you that I am heartily in favor of the plan the boys have been trying most of this month and which they will explain to you. You will see by their cards that they have not fallen down in their school work at all. They have, in fact, improved. They are, very evidently, vitally interested in your good herd of cattle and I hope you will not have to destroy that interest by disposing of the herd.

Sincerely yours,
W. A. MEINER.

"Mary," he called, "come here."

EARL BINKERT, WERNER HUMMEL, AND CARL HAUSZ.—THREE JEFFERSON COUNTY, WISCONSIN, JUNIOR FARMERS WHO ARE EXPERT CORN JUDGES. AT THE RECENT CLUB ROUND-UP THESE THREE COMPRISED THE WINNING CORN JUDGING TEAM.

"I've been here for several minutes," said Mrs. Daniels from the doorway where she had been standing, unobserved by anyone.

"Did you hear what these boys have been doing?" he demanded.

"Yes, I did and what's more if you sell—"

"Wait a minute, mother," interrupted he. "Just read that note and look at these cards. Bob hasn't got a standing under 90 and Ben's only got one and that's 88.

"Sell that herd?" he continued, "well, I guess not. If these boys can do as much extra as they've been doing this month, I can do a little more'n I have. We can do without testing some of our cows this winter that I wanted to run a second time, and we'll make things go somehow."

"Yes, and that isn't all. Hereafter that bunch belongs to Daniels & Sons. Do you get that, you fellows? And it won't be the name only. You're to share in some of the profits too. It won't be half at first but it will be a fair share. Now will you be satisfied?"

"Yes sir. Thank you." was about all they could manage to say for awhile, but their faces said a great deal more.

Satisfied? Why those boys wouldn't have changed places with any other two boys in the world just then.

Junior Letters

Hoard's Dairyman Juniors:—I will write a few lines as I have not written for quite a while. We are gathering our crops now. I think we will have about 440 bushels of corn. We did not raise any cotton this year. We are only milking three cows now.

I have a bicycle and like it fine and I can ride it pretty well. We sowed some rye and it is just coming up and had a nice rain last night.

They have dismissed school on account of the flu. I attended the fair at Memphis. The aeroplanes came down and flew around. One represented the Germans and the others were shooting at it. He shut his engine off and got too close to the ground before firing his engine and he cut himself loose and jumped fifteen or twenty feet. It did not hurt him much, but bursted his ship.

I saw the big hogs; there were some nice ones and saw some nice cows. I went out to the zoo and saw monkeys, elephants, zebra, and a lot of other things and had a nice time. They did not have a fair here.

I have sold three pigs. I have bred our sow again. We are going to ship some hogs this winter.

Mississippi. Earl Barber.

Hoard's Dairyman Juniors:—I received my fob, button, and creed and am very much pleased with them.

I am 10 years old and am in the sixth grade. I go to the Groton Union high school. I have a very nice teacher. Her name is Miss Mosher. We do Red Cross work. We cut out squares and make blankets for the soldiers. I belong to the junior Red Cross. Our school has closed for two weeks on account of the Spanish influenza.

I have a calf that is growing fine. She is a pure-bred Holstein. I have about 15 rabbits. They are white ones with pink eyes. I let them out this spring. They got into the garden and ate some lettuce and beans and tomato plants. We ride horse back. Last winter I rode horse back to my traps. I only had a few traps. I caught 3 muskrats. This year I have 15 traps.

We live on a farm of 140 acres one mile east of Groton. We walk to school. We have 23 cows, 2 heifers, 7 yearlings, 10 heifer calves, and 2 bull calves. We are milking twenty of them. We have a milking machine. It is run by an engine. We are milking by hand now. Most of our cows are strippers now. I milk about five every night. We have 5 horses. We also have 14 little pigs, 2 sows, and a shoat. We had 420 bushels of oats and 85 bushels of wheat this year.

My letter is getting rather long so I guess I will close. Wishing good luck to the juniors.

New York. G. Nelson Hunte.

Hoard's Dairyman Juniors:—This is my first letter. I have a heifer. She will be two years old Oct. 20. She is red. I am going to have her horns cut off this winter. We have two pigs. They are white. We have five horses. I have a Shetland pony. We are milking eleven cows. I milk five. We are going to fill silo Friday.

I am fourteen years old and weigh 110 pounds. I have two brothers, one 10 and the other 2 years old. We have five ducks and eight geese. We are raising four calves.

As my letter is getting long I will close. Wishing all the juniors good luck. My address is R. D. 2, Lake Geneva, Wis.

Maurice Kizer.

Hoard's Dairyman Juniors:—Everything is fair around here. My father has his plowing done. He has about 25 or more acres.

My calf is fine and in good order. She is going to come in next winter. Then I will have another cow to milk. Then I expect to get some money to buy saving stamps.

My father bought me a nice lamb from one of the neighbors. He had to pay $15 for it.

We have no school now; we have a vacation for a few weeks on account of the Spanish flu. So I have been helping my father all I can. I milk four cows and still haul the milk to the factory. We have a new cheesemaker. The one we had before left us. We haul about 215 lbs. of milk and milk 16 cows and one the calves milk. They don't give much because they have been milking all summer.

We got two loads of potatoes that we are going to sell but now they are hardly worth taking about 15 miles and getting a dollar a hundred for them. So we are going to wait until the price goes up before we sell them.

This month we sold 2 cows; one the calves milked and one we milked, and seven other cattle and one little calf. We got $750 for them. We also sold 4 pigs and received $115 for them. We still have 2 pigs which we expect to use ourselves for winter. My father killed a lamb that weighed 155 lbs. before it was killed and when it was dressed it weighed 75 lbs.

We are giving our cows silage and feed and after that they get some hay and a little straw just for tonight. Sometimes we do not give them straw.

My father is helping a neighbor for a day and a half cutting wood, so I have been doing all I can at home when he is gone.

It has been getting colder now so I suppose we will have winter soon. We need rain but it don't seem to rain but a little; it all helps.

We have a little colt; we have been getting him halter broke; he will not lead but he will learn.

Wish some of the juniors would write to me. My address is R. 1, Ringle, Wisconsin.

Chester Mortenson.

ott Brothers' Holstein-Friesian Sale

ne Elliott Brothers of Woodward, a, dispersed their herd of Hol- n-Friesians at Waterloo, Iowa, ember 6.

his sale was made not because of dissatisfaction on the part of e gentlemen with the dairy and ding industry, but purely because r business interests demand that partnership be dissolved. One of brothers is located in Mississippi the other has extensive interests he Southwest. These conditions e it impossible to continue the l in Iowa, hence the sale. Both he partners regretted sincerely necessity of breaking up a herd attle that represented so much ght and careful work in its up- ding.

he father of the recent owners ted the herd about 25 years ago. policies that he adopted in the nning have been followed and fully developed in all the breed- operations of the plant. That e policies were well founded was vn by the sale in Waterloo.

ood sires have always been kept he head of the herd. The founda- bull was Jeek's Prince, one of first sires of the middle west to admitted to the Advanced Regis- The splendid A. R. O. work of daughters won this place for him.

The bull that has been at the head of the herd for the past two years is King Pietertje Ormsby Piebe. He is unquestionably the greatest bull of the breed from the standpoint of breeding possessing world's record yearly production. His two nearest dams have an average of over 83,200 pounds of fat and 29,640 pounds of milk in one year. This is an unequaled qualification.

At the same time he is remarkable from the standpoint of individuality and he has proven his ability to transmit that type to his offspring.

The cows in the herd were all good, strong, well developed individuals. They were just the kind that one seeks for large, economical, and profitable production.

There were six beautiful big producers that had proven their capacity by making seven-day official butter records of thirty pounds or over. This in itself is a distinction of remarkable importance.

The popularity of the Ormsbys was evidenced in no uncertain way by the manner in which the sons and daughters of King Pietertje Ormsby Piebe were bought. There were seventeen in the sale, three bulls and fourteen heifers. All of the bulls and six of the heifers were 1918 calves, the other eight being born in 1917. This little group brought a total of $10,310. Four of them were bought by J. B. Irwin of Minnesota, three by D. G. Maxwell of Iowa, three by J. R. Bell of Pennsylvania, and three by Dr. N. J. Deiling of Iowa.

Dr. Deiling is just starting a herd on his Iowa farm. He bought the largest number of any bidder in this sale and he also topped the sale when he paid $1,300 for Queen Pietertje Parthenia Ormsby, a 13-month-old daughter of the Ormsby bull and a good A. R. O. dam. She is a beautiful, promising heifer. Dr. Deiling paid $7,000 for eight head, an average of $875 each.

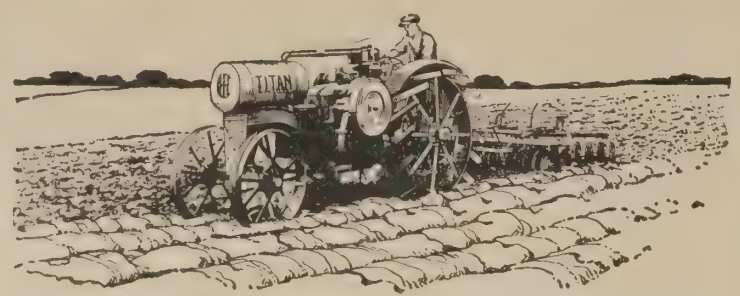
In all, sixty head were sold for a total of $37,385, making an average of a little over $600 each. There were only five bulls in the sale. They average $730 each, totaling $3,650. The fifty-five females brought $33,735, averaging a little over $613. The ten highest priced females averaged $1,029 each.

The cattle will be scattered into nine states, for buyers came from Iowa, Minnesota, Colorado, Missouri, Illinois, Wisconsin, Michigan, Indiana, and Pennsylvania. Naturally the largest number of cattle stay in Iowa.

The sale was a decided success. Such was the verdict of men qualified by their experience and long association with the breeding industry to speak with authority. The averages and the total were gratifying to the men who were selling and also to the breed boosters. The prices paid and the general enthusiasm forecast a very bright era—one of continued prosperity for the breed in the middle west.

The sale also emphasized three points that are well worth pondering. In the first place, publicity plays an important part in the success of a sale. The event that is well advertised will outclass the sale which is given a small degree of publicity. Elliott Brothers bought generously of advertising space.

In the second place, the public is looking for yearly record stock. The thirty-pound-cows were not as keenly sought, proportionally, as the stock that had an abundance of yearly record blood in their pedigree.



Finally the buyer wants good individuals. The cow that is not quite up to standard even though she may have a splendid short time record is often passed by for the high class cow without a record, all of which promise much for the breeding industry.

"What Can I Reasonably Expect of a Tractor?"

SO MANY farmers ask us this question that it deserves a public answer. When you buy an International kerosene tractor you can expect—

Plowing, as deep as you need, as fast as good plowing can be done, at low cost because your tractor operates on kerosene.

Good work on plowed ground. This is important. You can use your tractor for all the seed bed work, giving your crops a better start and a better chance.

All kinds of belt work. Individual threshers, ensilage cutters, feed grinders, hay presses, and many other useful, labor-saving belt machines soon follow an International tractor because it does good belt work at low cost.

An International will haul your crops to market, clear your land, grade and level roads. In any size or style it is a true "general purpose" tractor, useful for all kinds of farm power work, built by a Company that has built farm machines and tractors in large numbers for many years.

That is what you may reasonably expect from an International kerosene tractor. The local dealer can give you any further information you want. See him or write direct to us.

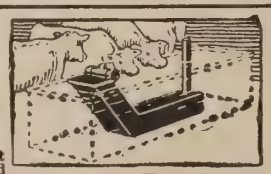
Apollo for Culverts

Rust-resistant, Durable, with Copper Steel base—



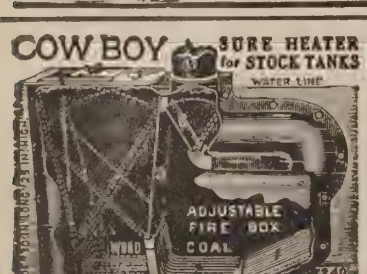
Apollo-Keystone Copper Steel Galvanized makes safe, substantial roadway culverts.

APOLLO is the highest quality galvanized product manufactured for Culverts, Flumes, Tanks, Roofing, Spouting, Garages, and all exposed sheet metal work. The added Keystone indicates that Copper Steel is used. Time and weather have proved that APOLLO-KEYSTONE Sheets last longest in actual service. Sold by weight by leading dealers. KEYSTONE COPPER STEEL is also unequaled for Roofing Tin Plates. Send for "Better Buildings" and "Apollo" booklets. They are valuable to all sheet metal users.

AMERICAN SHEET AND TIN PLATE COMPANY, General Offices: Frick Building, Pittsburgh, Pa.

NEW WAY TO WARM WATER FOR STOCK

You wouldn't think of burning $1.50 grain under a water tank! Yet that's what happens when stock drink ice water! Their body-heat—produced by feed—is absorbed in warming ice water instead of making milk, muscle fat. Warm the water with this oil-burning heater; your stock will drink more—require less feed—save bushels of grain.



BUSBY OIL-BURNING TANK HEATERS and NON-FREEZING HOG WATERERS

Tank heater costs one-half cent per hour for kerosene. No smoke, no sparks, no danger. Fill tank once in 36 hours. Keeps water at animal heat. Can't freeze even at 30 below zero.

Free Folder and Special Offer. Busby Hog Waterer costs 2c a day for kerosene. Holds 70 gallons of water. Never freezes. Write for special discount offer to owner-agents on tank heater and hog waterer.

Co-operative Creameries of Minnesota

(Continued from page 732)

I speak with the greatest respect for universities and colleges. I am glad to be able to say that the University of Minnesota has always stood back of the co-operative creameries. Professor T. L. Haecker, for twenty-five years at the head of the Minnesota Dairy School, gave the full weight of his great influence to the cause of co-operation. He put scientific methods to work in the hands of the farmers of the state through their co-operative creameries. Through the co-operative creameries over 100,000 farmers of Minnesota became joint owners in a manufacturing business that this year will run close to $50,000,000. The dairy farmers of Minnesota have learned to work together through their co-operative creameries to their advantage and they will continue to work together.

Co-operative Creameries Pay

I have before me reports from a number of co-operative creameries that paid 70 cents a pound for butterfat for the month of September of this year. A great number paid over 65 cents and the rank and file of the co-operative creameries in Minnesota paid above 63 cents. The average price of butter (New York extras) for September was 56.041 cents. As the price of butter has advanced, the overrun has enabled the co-operative creameries to pay their patrons a much higher price for butterfat than the price received for butter.

For the month of August of this year I received reports from 250 co-operative creameries in Minnesota. These reports were from the and file of the creameries of the Of the 250 creameries all but 24 above New York extras for butt The highest price was 61 cent lowest was 42 cents, and the av price paid by all of them was cents. The average price of (New York extras) for Augus 46.03 cents. The co-operative c eries were 6.67 cents above. paid their patrons for 3,3 pounds of butterfat for the n Had these farmers sold their through a non-co-operative n that commonly pays New Yor tras or below for butterfat, would have lost at least $224,8 the loss of all the co-operative c eries of the state for the mont der a non-co-operative system conservatively be estimated at million dollars. *Co-operation I*

FARMERS' CO-OPERATIVE CREAMERY AT DOVER, MINNESOTA

This creamery took in 22,263 pounds of butterfat for the month of August, 19 and paid its patrons a net price of 60 cents a pound for butterfat. It is one of 67 co-operative creameries in Minnesota that supplies the United States Navy w butter. It is one of the new types of co-operative creameries being built in Minnes It operates in a single community, has a cow testing association, and stands for operation and progress in all lines.

Good Citizenship

I made the statement in the ning that the co-operative crea of Minnesota are teaching goo zenship. I would like to clos that thought. To me this see most important thing in the When men work together in helpfulness—when they are n willing but glad that their nei shall prosper with themselves they are learning good citiz This, and only this, constitut citizenship, true democracy.

I am writing this for the mas issue of Hoard's Dairy sincerely thank God that the s for world democracy has bee and that the birth of Jesus among men shall be welcome with the nations of the w peace.

Co-operation, When and Why It Succeeds

(Continued from page 733)

from them what the price should be.

This brings us back to co-operation. It is the co-operative group that can meet the question with intelligence. We have blundered through the mazes of price-making by authority during the past two seasons. When an opinion from the farmers was wanted, it had to be obtained from scattered individuals in all too many cases. This was true because there was no organization ready to speak. It was hard an expression from the grain ers. Harder to get the views milk producers, and impossi get an expression from the producers. Never again will be such chaos because durin few years organizations hav made vastly more effective th before.

A Substitution Rather Than E tion of Middlemen

Co-operation does not as mean the elimination of any of middlemen. This has ofte heralded as the end and aim

rit. Experience shows that very
farmers' organizations have
eded in eliminating any num-
f middlemen. What they do is
t their own man in the place of
other middleman. The elimi-
n comes, if at all, through the
er efficiency of the farmer or-
ation and in consequence a re-
n in the number of middlemen
given character. The number
iddleman processes, however,
to have been the result of ne-
y of convenience, and in con-
nce is hard to reduce. An ideal
ting system, should it ever
will, without doubt, consist of
links between producer and
mer, but it is much easier to
ault with them than to shorten
number without introducing
costs and trouble equally seri-

at farmers will do well to un-
nd is that they can do many

n preparation.

ame principle applies to a mul-
of products. The sale as the
t is but a small part of the logical co-operative process. It should be begun long before the sale. Community action should result in a uniform product, as round, white potatoes, sanitary milk, Guernsey cattle, Jonathan apples, or whatever fits the climate, soil, and markets of the community. This means prosperity and progress. Products such as these can be, and will be, standardized, and standard products can be sold to advantage. The work of the middleman will be lessened and fewer complaints will be entered against him. There will not only be less middleman work, but the routine of the work will be such that it can be comprehended and done economically.

Much Already Realized

The most gratifying part concerning co-operation is that much of this program has already been realized. Not much in comparison to the ultimate possibilities, but much as compared with a decade ago. In Wisconsin are a great number of co-operative creameries and cheese factories, and a cheese marketing federation which deserves to rank as one of the best agricultural co-operative companies of the country. Through this company the farmers have learned to know the cheese market and to satisfy themselves as to the price cheese should bring. Thus the benefits are much wider than the membership. A similar move should be made by the creameries.

Another remarkable co-operative movement is that of the live stock shipping associations. These are local and have been organized in over two hundred villages and cities. The first benefit is economy in getting the work done, and correspondingly higher prices. The second benefit is a knowledge of the market and in consequence stock better suited for sale.

Other lines of co-operation are accomplished without formal organization, such as the purchase of feeds. This can usually be done at a saving of two or more dollars a ton. Co-operative sales of cattle are becoming the regular thing in several counties and are sure to develop in popularity. The co-operative method of handling seeds has proved a success among members of the experiment station groups.

The present high prices with their attendant high costs; the prospect of declining prices in the same lines; the need for applying business methods to all manner of farm affairs points to the desirability of an intelligent, well planned co-operation in many lines. Good sense would suggest that the improved methods be adopted before dire necessity makes it the only way out.

Time to Overhaul Machinery

The proper time for overhauling farming machines is during their period of inactivity and before the rush of spring work. If put off until needed, delay incident to getting repair parts promptly, press of other work, and the hazy recollection of the past season's difficulties may hinder the efficient prosecution of this work.

At the end of the season's work it is a plan well worth while to make out a schedule of needed repairs and adjustments for a particular machine and file it in a convenient place, so when opportunity arises the work may be taken up and prosecuted expeditiously. The machine itself represents capital invested. It should be housed properly and not left in a fence corner or other out-of-the-way place for wooden parts to rot and metal parts to rust, which, even for short periods, may cause more deterioration than the season's use.—U. S. Department of Agriculture Weekly News Letter.

A Real Investment

Before you put them up, figure your buildings on the basis of an investment. Will they add to the market value of your farm should you wish to sell? Will they contribute to your profits? Or will they be a continuous expense for upkeep, and a loss through rapid depreciation?

Figure these things out in dollars and cents, and you'll find that for a *real* investment it pays to build with

Natco Hollow Tile

In ten years, or even less, the saving in paint, repairs and insurance will more than make up the difference in cost. After that, *all* these savings will be *clear profit*. And you can pass on the buildings from generation to generation.

Natco buildings are fire-safe, vermin-proof and strictly sanitary. The dead air spaces in the walls keep out cold in winter and heat in summer. Natco buildings combine beauty and utility.

Ask your building supply dealer to show you samples of Natco Hollow Tile. He has plans, too, for many types of farm buildings —ask to see them.

Write today for our book, "Natco on the Farm." It's free.

Grind Your Feed

With the Williams Patent LITTLE GIANT GRINDER

The Little Giant Grinder will grind your Ear Corn (husk, cob and all), your Oats, Wheat, or any other grain, into either a fine, medium or coarse meal as desired. It will not merely crack these grains but will grind them into a real meal.

Equipped with genuine SKF ball bearings power requirements are reduced to the minimum. Four sizes give a wide range of capacity. Hundreds of farmers are using this machine, therefore, if you are anxious to save grain and reduce feeding costs investigate and install this machine. Bulletin No. 699 explains in detail.

A Dairy Farm Romance

[Continued from pgae 736]

him so aback that in sheer amazement he could not utter a sound. He went to the kitchen door and opened it, and walked uncertainly down to the barn. It was the first time in their married life that his wife had expressed herself so freely, and it set him off his balance. It was some time before he had sufficiently collected himself to read Doris' letter. And, though what he read made him inwardly ashamed of himself, he could not bring himself to humble his foolish pride.

He ate his dinner and supper in dour silence, never lifting his eyes from his plate. When he came back into the house after the heavy evening chores, his wife had gone to bed.

She did not get up in the morning. He prepared and ate his breakfast, and then, when there came no sounds from her room, his sullenness gave place to genuine concern. He went softly up to her room.

At his entrance she moved weakly on her pillow. Her eyes seemed unnaturally bright, her cheeks unusually flushed. She complained of pains in her limbs and back, of a dull throb back of her eyes. She asked for more covering. And Nathan, who had never known her to lie abed daytimes, except on the occasion of Doris' entrance to the world, realized that his wife was very sick.

In panicky haste he secured an extra comforter and spread it over her bed. He gave her a drink of water, and then, throwing on his hat and coat, he made for the nearest neighbor, running stumblingly most of the way. From there he could telephone for a doctor.

The boy answered his urgent knock.

"Pa and ma's sick," he said, as Nathan stepped inside. "Doctor said 'twas the influenzy. Most everybody in town has it, doctor says, and it's mighty bad, and I'm scared."

"When's he coming out again—the doctor, I mean?" asked Nathan.

"This morning. I was just looking for him. Mrs. Fuller, who's here takin' care o' ma 'nd pa, just telephoned him, and he said he'd be out right soon."

"When he comes, send him over to me. Can you remember that? Send him over. And don't you forget it. You go tell Mrs. Fuller that right now to tell him when he comes. Go, now," he ordered brusquely.

And not until the boy returned and reported that he had done so, did Nathan stir from the spot.

Mrs. Feinwell had not changed her position while he was gone. She opened her eyes and looked up at him wearily when he entered, but almost immediately afterward closed them again. It seemed hard for her to breathe. Nathan placed his calloused hand on her fevered brow and felt of the careworn hand that lay on the patchwork comforter. He asked whether there was anything she wanted, anything he could do for her, and at her whispered negative, he tiptoed from the room with an awful weight of helplessness sagging his shoulders.

The two days that followed ever afterward seemed like some hideous nightmare to him. His brain seemed numbed. He moved about between his wife's room and the barn like an automaton, caring for his cows, and mechanically following out the directions the doctor had given him. He had tried desperately to secure help, but with city and country alike in the grip of the epidemic, there was no help to be secured.

The urge to send for Doris battled with his obstinate pride, and in the end he clamped his jaws grimly and pride prevailed.

Late in the afternoon of the third day he sat in the straight-backed chair at his wife's bedside. His face through the week's neglected stubble showed gray and haggard; his eyes, red-rimmed and hollow from sleepless, troubled nights burned like live coals in his head. He kept them fixed on the slight form that lay on the bed before him.

The doctor had been there at noon but had offered little encouragement when he met the dumb, pleading inquiry in Nathan's eyes. And when he left, gray fear settled down over Nathan's world.

And now, as he sat there watching the thin, drawn face, and listening to the labored breathing, he suddenly realized what that gray fear was. And with the realization came the soul-shaking, overwhelming feeling of guilty responsibility. His fevered mind raced back over the years, laying bare with accusing vividness things that wrenched him to the core.

He saw his wife as she was when he had married her, an innocent, happy girl of nineteen, straight-limbed, fresh-cheeked, gay-eyed with the joy of living and loving. He saw again the pride of achievement and the rekindled hope that shone in her eyes when they had paid off that first mortgage. He saw again the many, many sacrifices she had made, the toil-packed days she had lived through uncomplainingly to do her part in the attainment of that object. She had planned on building a new barn and remodelling the outbuildings the following spring, "for," she said, "the buildings are as important as the land itself. With up-to-date buildings and modern equipment we can do our work more easily and really more economically. And it will give me more time for Doris, now that she's growing up."

But when in the spring he had the chance of buying the extra eighty, he had overruled her pleadings. He remembered well her words. "Nathan, don't do it. Don't be land greedy. We have as much land now as we can work, and if we spend only one-third as much as we'd have to pay for that eighty in building up and caring for our herd, we'll be better off in the end. You'll work yourself to an early grave and you'll work me there too. I want a better place for Doris than the one we have. I want a decent house with some conveniences, not so much for myself as for our daughter."

The hard years that followed passed in retrospect before him. And every line in the careworn face upturned on the pillow was a mute witness of the privations his blind land greed had forced her to endure. Now, face to face with the possibility of her going out of his life, there came to him a sudden realization of her priceslessness.

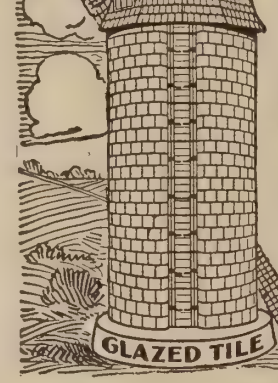
His thoughts reverted to Doris, Doris who was so much like the girl he had married twenty years ago. With the bald picture of the farm life he had been responsible for before his mind's eye, he found himself wondering not why she had revolted, but why she had not revolted sooner. For he saw clearly now that he had never done anything to make her like the farm, to make her content to stay, that, in fact, he had done everything to drive her away. He saw that the only tie that had bound her to him heretofore was love for the little, hard-working mother.

He realized, too, what a ghastly mistake it would have been for her to marry the man of his choice. Bitter though the pill was he recognized the fact that he and Tom belonged to the old order of things. He saw in Tom traits of his own. Frugal, thrifty, hard-working, though he was, he nevertheless lacked the tenderness, the consideration, and open-heartedness of young Jim. The man without those latter characteristics could

This Is A Time to Buy Silos By Name

Today, every dollar must be made to produce its utmost in buying power; every purchase must accomplish the utmost in utility. A good silo should last for generations; therefore you cannot afford to experiment and perhaps buy one that will last but a few years.

Let the name "Kalamazoo" be your guide to the best silo values and the greatest silo satisfaction.



Kalamazoo

TILE and WOOD SILOS

"THE WORLD'S STANDARD"

Considered from any standpoint—food conservation—economy—better feeding—better live stock—bigger profits—the Kalamazoo Silo is a valuable asset to any farm. During the twenty-eight years they have been on the market, no Kalamazoo Silo has ever "worn out" or passed the usable stage. Think of that!

184-S

GLAZED TILE SILOS

"Permanent as the Pyramids"—fire-proof, frost-proof, storm-proof, moisture-proof, acid-proof, rot-proof, vermin-proof. Galvanized reinforcing. Require no paint, no upkeep expense or repairs. Easy to build—and solve the silo problem *forever*.

WOOD STAVE SILOS

Your choice of four of the best time-defying woods. Shipped complete, ready to set up. Quickly and easily erected by inexperienced home labor. All Kalamazoo Silos, whether wood or tile, have the famous Kalamazoo Galvanized Steel Door Frames and continuous doors.

Investigate Now

There is no reason to postpone action any longer. A little investigation and study of the silo question will quickly show that the Kalamazoo is the best for you. We offer *special inducements* to early buyers, and *easy terms*, too, if desired. Write for catalog today.

r, and each time it was only
perhuman rallying of his will
that he was able to get back on his feet.

Gaining the house, he drove himself to the accomplishment of several tasks that his subconscious self urged upon him. He placed a glass of fresh water on the table within easy reach of his wife's hand. He threw an extra blanket over her. He put an extra scuttleful of coal on the base burner in the living room, and then crawled weakly to the blanketed couch and threw himself upon it.

It was the day before Christmas. Nathan Feinwell, with a tray of empty dishes on his knees and his back propped up with a generous supply of pillows, was sitting up in bed.

In a rocker near the south window sat Ma Feinwell, a shawl over her shoulders. She was placidly knitting and humming to herself as she worked. A new look was on her face, a new light in her eyes.

A light step sounded in the hall, and Doris appeared in the doorway.

"Finished, dad?" she asked.

He nodded. She picked up the tray and was about to leave the room when he stopped her.

"Where's Jim, Doris?" he asked.

"He's out in the barn fixing up the—"

"Well, never mind," Nathan interrupted. "Doris, your ma and I have about decided that we old timers need a rest and a sorta—sorta honeymoon, isn't that it, ma? Ma and I are really going to live now, ain't we, ma? And —and we kinda thought we'd like to —well, we'd like to do it, if we could find two nice young people in whose hands we could leave the farm, to work it as they pleased, new-fangled notions or not. And we kinda picked out you and Jim. Doris, do you think you'd care to live here if the house were fixed up a bit with furnace and lights, and other things, and if Jim'd have a free hand with the farm and the stock?

"D'you think you could stand ma and me boarding with you, and messing around helping when we felt like it?"

For a moment Doris stood in stunned silence. Then she dropped the tray on the bed and threw her arms around her father's neck.

After a long interval she raised her head.

"Oh, dad, d'you know what day this is? Tomorrow's Christmas. And it will be the happiest Christmas you and mother and I have ever had!"

SHERWIN

THE Sherwin-Williams trade-mark is not only the mark of a product. It is also the symbol of an industry. As a symbol it stands for everything that science, skill and experience can contribute to the making of goods that will best serve your needs.

And one of the things that is vital to the making of goods that will prove to be exactly suited to their purpose is scientific accuracy. There is no guesswork, no half-way measures and no doubtful expedients in manufacturing

SHERWIN-WILLIAMS PRODUCTS

PAINTS AND VARNISHES

DYESTUFFS, COLORS, PIGMENTS, CHEMICALS, INSECTICIDES,
DISINFECTANTS, WOOD PRESERVATIVES

WILLIAMS PRODUCTS

Each Sherwin-Williams Plant has its own Chemical Laboratories

These 20,000 cans hold standard samples to which each Sherwin-Williams Product must measure up

No guesswork
No half-way methods

F you spray your trees with Sherwin-Williams Arsenate of Lead, you find that it kills the tacking insects but does not burn the foliage.

If you paint your barns, outhouses and fences ith S-W Commonwealth Barn Paint, you find it vers a large surface and stands the weather for long time.

If you protect your farm machinery with S-W agon and Implement Paint you add years to life and usefulness.

This is always true—not sometimes true. It is true not only of these products, but of all Sherwin-Williams Products. It is to insure this unfailing service that we maintain laboratories manned with skilled chemists wherever we manufacture.

Whether you have a house to paint or a potato crop to protect, an orchard to spray or a chicken house to disinfect, or a use for any Sherwin-Williams Product, our trade-mark means that the product for your purpose has been developed by trained scientists and has passed every laboratory and practical test.

The Tripod of Ready Roofing

There is much more to ready-roofing than appears on the surface. You can't judge a roofing by its looks alone.

The three principal elements of ready-roofing—felt, saturant, and coating may be compared to a tripod. This tripod supports the quality of the roofing. If one leg fails, quality suffers. When you buy Ru-ber-oid you know that no flaw will develop and a leaky roof result. The tripod which supports Ru-ber-oid Quality is sound at every point. Briefly, here are the facts:—

Felt

The backbone of ready-roofing is felt. Upon its quality, primarily, depends the life of the roofing.

The highest quality of roofing felt is made from rags. Substitutes for rags are waste paper, straw, and clay. If these substitutes are used extensively a felt results closely resembling cardboard. Cardboard is not a good roofing material.

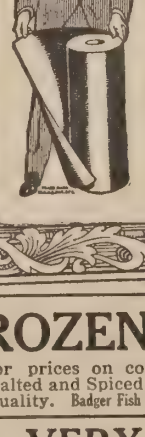
The enviable reputation enjoyed by Ru-ber-oid during the last quarter of a century is due largely to the fact that only the highest grade of felt has consistently been used in its manufacture.

Saturant

The saturant, properly compounded and applied, preserves the felt and will remain unchanged for many years. *It will not evaporate.*

Inferior saturant — similar to "road oils"—used in manufacturing some low grade roofings, will begin to evaporate as soon as introduced into the felt.

The saturant used in Ru-ber-oid is the result of many years of patient experimentation. It is forced into the felt under heat so that every pore is filled.



It stays where it is put and will not evaporate appreciably even at 500° Fahrenheit.

Coating

The function of the coating is to seal in the saturant.

Coatings are made of asphalts and other bituminous materials. There are hundreds of materials available and a thousand possible combinations and they all *look* alike. Each one, however, acts *differently* when exposed to the weather.

We know of only one combination that meets all tests satisfactorily — that lasts longest without softening and sliding, checking and cracking, drying up and dusting off. This *one* combination is used for coating Ru-ber-oid.

perspective is a mighty good . Take, for instance, the va-s of the corn market and one I think that most of the corn was on these markets. As a matter ct only twenty-six per cent of orn crop ever leaves the farm ot over twelve per cent is used uman food. What would be the of corn if we reduced our live even ten per cent?

Why a Case Tractor Is More Profitable

THE number of working days for an advanced tractor like the Case 10-18 is rapidly increasing. Men thought of tractors principally for plowing twenty-six years ago, when we first began to build motor tractors.

In later years, with the introduction of our smaller sizes, men were satisfied with a maximum of 30 days' use per year.

But war-time conditions have brought about changes not only in the mechanical development of tractors, but in their adaptation for multiplied uses.

More Ways to Use Your Tractor

Our latest and best small tractor, the 10-18, is purposely designed for maximum use. It is adaptable for all kinds of work. It represents years of study in the field, dozens of extensive investigations.

The Case 10-18 is small and compact. It weighs little more than a team of horses. Its length is 102 inches, width 56 inches and height 54½ inches. It turns in a 22-foot circle, and can get around easily. It goes through a small gate or door and easily shares the road with other vehicles.

While rated at 10 horsepower on the drawbar, it develops nearly 14. While rated at 18 on the belt, it develops up to 24. This reserve power makes it ever ready for an emergency.

There are dozens of improvements in this Case 10-18. For instance, it has a one-piece main frame, with a four-cylinder engine mounted crosswise. This frame construction affords a dust-proof housing for the rear axle, bull pinion shaft, transmission and the bearings for these parts. It also provides a base for the motor.

This type of construction brings rigidity. It minimizes vibration and prevents disalignment of gears, which are all cut steel and fully enclosed. Thus we multiply strength, reduce weight and conserve power.

Another feature is its economical consumption of kerosene. It has a Case Sylphon Thermostat which controls the cooling system and insures complete combustion of kerosene. And it prevents raw fuel from passing by the pistons and diluting oil in the crank case.

An improved air-washer delivers clean air to the carburetor. No grit nor dust gets into the cylinders to minimize their efficiency and shorten their life.

Our illustrated booklet describes all the advanced ideas in the new Case 10-18.

We will gladly send a copy free. Or it may be obtained of a Case Dealer.

Jericho Guernsey Farm, N. C. Dahl, Owner, South Haven, Mich.

Where Shall We Go From Here?

(Continued from page 731)

own income is so small, but we must remember that the bigger men we get to lead us the better will be our returns, and we cannot get the big men without competing with other big business in the matter of salary. A man capable of managing a large co-operative organization can command a large salary in many other lines of business.

Farm Representatives, Yes! Politics, No!

Save all farmers' organizations from politics! Let us avoid them as a pestilence. This does not mean that organization should not stand and work for the principle of farmer representation in state and national legislature. One of our crying needs is a bigger part in the counsels of the state and nation, but this can be secured without making a political party of our organizations; and, if we do, we can be sure that while our success may be brillant, it will be short lived.

It is a great temptation to throw the influence of an organization into a political fight when the cause seems to be going against farmers, but in the first place an organization made up of members of all parties can never be lined up solid politically. In the second place, if the fight is successful, perhaps the other party will get into control in two or four years, and then the organization will be in hot water. Again, the experience of farm organizations that have gone to pieces on political snags should be a dire warning.

"Money Makes the Mare Go"

Reference has already been made to the finances of co-operatives. In Denmark, the land of the co-operatives, a sound financial plan is worked out before the organization is started. In no place is it more true that money is power than a co-operative organization. It takes money to hire leaders, to run offices, to hold meetings, and a niggardly policy will stop all progress. Conditions are actually such in the marketing of farm products that the few cents spent to support a good farm organization will return as many dollars, to say nothing of other benefits. Let us give our organization plenty of funds to make it efficient in fighting our cause.

Another requisite of successful co-operation is education, the enemy of suspicion, narrowness, and ignorance. The work done by our colleges and schools of agriculture has been a large factor in the rapid rise of organization. The agricultural high schools should have our encouragement and support for the same reason; for the young men who have had short or long courses in agricultural colleges and schools return to their communities with an understanding and respect for and skill in their occupation that makes them successful leaders. However, the younger generation does not have a monopoly of this progressive spirit. There are older men in every community who, although they may not have much schooling, are educated in the best sense of the word, and these older men with their progressive outlook and their rich experience make some of the best leaders of the organization movement.

But we do not know enough about our business yet to get the best results from organization. Farming is a many sided, complicated science. We can hardly expect to get costs of production or adequate returns for our products if we do not know what they are, and if we are not in a position to prove what they are by accurate evidence. Such evidence can only be had by each of us keeping records and having a detailed knowledge of our business.

Confidence is the Backbone

The greatest and most important part of all that we must learn, if our organizations are going to succeed, is that of confidence in one another and in our leaders. It has been the history of many co-operative organizations that as soon as they were well started, someone whose motives might well be questioned began to cry, "thief, thief," and to say that the leaders had sold out. The members were too quick to believe this; they lost confidence and the organization went to pieces. It is impossible for every member to have all of the information that the leader has in guiding his action in making decisions. The individual member is not in a position to look at all sides of the question. He cannot injure his own interest or the interest of his brother member quicker than by being too quick to believe that the leaders of his organization are incompetent or guilty of actual wrong doing. If the leader is not right he, of course, should be changed, but let us be sure of our facts before we lose confidence; and let us bury the old lurking suspicion that our neighbor farmer is not loyal. The milk strikes in the last two or three years show that he ls loyal and can hang to the bone as long as there is anything to hang to. Let us remember that he has the same occupation, the same hopes, ideals, and aspirations as we ourselves have, and that the chances are he will keep his shoulder to the wheel of co-operative action and push just as hard as we will.

In conclusion I would like to leave, with those who have patience enough to follow me so far, a summary of a few principles that experience has taught us to be fundamental for the future success of farming.

First, as farmers we will organize every branch of farming down to almost the last individual, and every farmer will be willing to give his just share of financial dues and service to make his organization a success.

Second, we will federate all local organizations nationally so that the agriculture of the nation may speak as a unit when necessary.

Third, we will secure local initiative and action, including live, well attended, and well organized farm meetings.

Fourth, we will have good leadership, both local and general.

Fifth, we will keep our organizations from becoming political parties.

Sixth, we will develop education in and knowledge of our business.

Seventh, we will develop confidence in one another and in our leaders.

And lastly in answer to the question which heads this article, "Where Shall We Go from Here?" we shall go right on doing business on the same good old place, but not in the same bad old way.

Delaware Corn Show Prize Offers

The Delaware State Corn Growers' Association will hold its 12th Annual Convention and Corn Show at Bridgeville, Delaware, January 14th to 17th, 1919.

In order to interest the corn growers at large the association will offer the following prizes for the best ten ears of corn shelling the most grain by weight. The samples will be scored on the basis of 25% for uniformity and 75% for grain weight. The contest is open to any corn grower in the United States. First prize, $10 gold; second prize $5; third prize, $2. No entry fee is charged. Samples may be sent by parcel post to A. E. Grantham, Secretary, Bridgeville, Del., not later than January 12th, 1919.

A SON OF KING OF THE PONTIACS

The World's Greatest Proven Sire

For $350

This is half his value—but his color is against him, as he is nearly all black. He was born in August, is a splendid individual, and is out of a 19-lb. 3-yr.-old. Don't miss this chance of a life time.

Geoffrey G. Burlingame, Cazenovia, N. Y.

A Chance to Buy a Son of King Korndyke Sadie Vale

At less than half his value, because he is dark in color. $400.00 buys King Korndyke Segis Johanna Ormsby, born Aug. 17, 1918. He is a large growthy fellow and a fine individual. His dam and sire's dam average over 35 lbs. butter in 7 days. Sire:—King Korndyke Sadie Vale, regarded as the greatest sire of his generation. His daughters, still heifers, are making wonderful milk and butter records. One K. K. S. V. Topsy made over 40 lbs. butter as a 3-yr.-old. He also has two other 3-yr.-olds with records over 30 lbs., and two 4-yr.-olds over 30 lbs. He is the sire of the youngest 29-lb. heifer of the breed. Dam:—Anna Johanna Ormsby, A. R. O. record as follows, butter 7 days 29.35, 30 days 122.30 lbs. She is one of the best daughters of Sadie Vale Sir Ormsby. Thus this young Bull has a double cross of old Sadie Vale Concordia.
W. D. ROBENS, POLAND, NEW YORK.

Holstein Heifers

325 High grade heifers 1½ to 2½ years old, bred to freshen this fall and early winter, large, well marked, fine condition.

50 Registered yearling heifers, beautifully marked, very well bred, good size, nice condition, extra fine lot.

35 Registered heifers, bred to freshen early this fall, practically all springing now, fine individuals, bred to good bulls.

Positively the best lot of registered and high grade heifers ever offered for sale in New York State. Buy now before the price advances.
J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Springdale Farms

Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. We are prepared to furnish carload lots of fresh cows, springers or cows due to freshen this fall, also two and three-year-old heifers. If you want large, heavy producing cows it will pay you to see our stock. You will find our prices right. F. P. SAUNDERS & SON, Cortland, New York. Office 50 Clinton Ave. Telephone 116 or 1476M.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.
Susquehanna Farms, Hartwick Seminary, N. Y.

A Grandson of the Famous $50,000 Bull

Here is a show bull, about three-quarters white, born Sept. 27, 1918. His sire is one of the best bred sons of the World's Greatest Sire,

KING SEGIS PONTIAC ALCARTRA

His dam has a junior three-year-old record of 22 lbs. butter and 482 lbs. milk. His ten nearest tested dams average 28 lbs. butter. Price $135. G. G. BURLINGAME, Cazenovia, N. Y.

Moyer's Holstein Sale

EARLVILLE, N. Y.

250 HEAD — **Guaranteed Under 60-Day Retest** — **250 HEAD**

I have advised many times that breeders could make money by going out and buying good pure-bred Holstein cows of good blood lines and take them home and make cows of them—then buy a good bull and breed them to him. This is my plan of making money out of Holsteins, for any one is sure to get two out of every ten that will pay for the whole lot. I have proven this by experience and I offer the same opportunity in this sale to other breeders. H. A. MOYER.

Consigned by 30 Leading Breeders from Madison and Chenango Counties

One-half of the sale is made up of calves, yearlings and two-year-olds of the greatest blood lines of the breed.

The two-year-olds bred to bulls of the best official backing and representative of the best producing ancestry.

Just the sort to take home and grow into money for YOU.

The remainder of the sale is made up of good young cows that have not been developed—the kind to take home, give them records and double your money.

But ten young bulls have been consigned—every one a desirable high class animal.

This is just the sale to attend if you want a car lot of clean cattle guaranteed against tuberculosis for sixty days after the sale and bred in the best producing lines of the breed. Sure to make money for their purchasers. For Catalog, write

H. A. Moyer, Director, Syracuse, New York.

ROVE DAIRY FARM, V. H. Hollingsworth, Gilberts, Illinois.

Sir Inka Prilly Segis Albino

Born Dec. 3rd, 1917.

A Real Bull For Some Small Breeder.

IF YOU ARE A SMALL BREEDER or beginner in the Holstein business and in the market for a herd sire, here is one that is worthy of your best consideration.

JUST A YEAR OLD—Ready for service. He is well grown, a splendid individual with faultless topline and marked nearly all white. As an individual he will suit the most particular.

SIR INKA PRILLY SEGIS, his sire, is one of the famous sons of the great King Segis, who has proved himself to be one of the greatest, if not the greatest, transmitting sires of the breed.

THE DAM OF SIR INKA PRILLY SEGIS is Inka Prilly with a record of 30 lbs. in 7 days. She is from a 25-lb. daughter of old Prilly and sired by a grandson of this same famous foundation cow.

THE DAM OF SIR INKA PRILLY SEGIS ALBINO is Princess Douglas Urmagel, a 24-lb. four-year-old daughter of Sir Urmagel Burke, a full brother to the 35-lb. cow, Urma Burke, and from the 31-lb. cow, Urmagelsche 2d A.

PRINCESS DOUGLAS URMAGEL is from a 29-lb. four-year-old daughter of DeKol Beets Segis, another well known son of King Segis.

THE THREE NEAREST DAMS of this young bull average over 28 lbs. Two of them being only four-year-olds. His seven nearest dams average 26.93 and his eighteen nearest dams average 26.77.

HE CARRIES THE SAME RELATIONSHIP TO King Segis as Segis Fayne Johanna, the only 50-lb. cow, Fancher Farm Maxie, the world's champion heifer with 47 lbs., and Mabel Segis Korndyke, former champion four-year-old with 40.32 lbs.

HE CARRIES A DOUBLE CROSS of both King Segis and the famous foundation cow, Prilly,—both animals familiar to breeders from coast to coast.

AND WE ARE OFFERING this young bull to you for $650, guaranteed sound in every respect and tuberculin tested by Federal veterinarians.

IF YOU WANT HIM, do not wait to write but send us a wire instructing us to hold for you.

The E. C. Schroeder Farms,
Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

If You Want Milky Bulls
Write at once
Winship Stock Farm, Owatonna, Minn.

A Grandson of

Sir Pietertje Ormsby Mercedes

FOR SALE

He is dark in color like his famous Grandsire. A choice individual. 2 years old. Dam, an A. R. O. daughter of a bull who was *Grand Champion* of a *National Dairy Show*. A rare bargain. **V. S. Culver, Stillwater, Minn.**

GRANDSONS OF KING SEGIS

Grahamholm Farm has a choice lot all ages up to 10 months. Sired by Sir Winana Beets Segis. He has a 35-lb. daughter, a 30-lb. daughter, and a good number of other great producers.

We also have sons of Dutchland Creamelle Colantha Lad, one of the best bred bulls for yearly production.

Every cow in the herd has an A. R. O. butter record. Come or state your wants. Address **W. J. BOYNTON, Mgr., Rochester, Minn.**

Buy Them Young

Buy your herd sire young and save money. You can raise it as cheaply as we can.

We are offering for sale some excellent young sons of Buffalo Skylark Ames, a champion at two National Dairy Shows with a fine list of A. R. O. daughters, and out of A. R. O. dams. Write for full information.

E. H. Kuchenbecker, R. 1, Owatonna, Minn.

3 BULLS **HOLSTEINS** **3 BULLS**

No. 1 born Feb. 17 almost white, his dam has A.R.O. rcd. of 20 lbs. at 3 yrs.

No. 2 born Feb.17 almost white, his dam has A. R. O. rcd. of 23.23 lbs.

All by a 23.3-lb. SIRE

No. 3 ready for service, his grandam has A. R. O. record of 20 lbs. at 3 yrs.

HENRY B. DANIELS, STANTON, MINN.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d, a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.

For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

Lashbrook Holsteins

Sixty head, high class A. R. O. cattle. On the Minnesota and Federal Accredited List, free from tuberculosis. Herd headed by a son of BEAUTY BEETS WALKER SEGIS. WORLD'S CHAMPION senior two-year-old heifer, yearly division, 25,343 lbs. milk, 1,040 lbs. butter in 365 days. Bull calves for sale.

U. L. Lashbrook & Sons, Northfield, Minn.

HE IS SIRED BY A SON OF

Sir Pietertje Ormsby Mercedes

that is out of a 30-lb. sister of Pietertje Maid Ormsby. His dam is a 17-lb. three-year-old daughter of a 28-lb. grandson of Sir Ormsby Hengerveld DeKol. He is mighty good to look at. Dropped last August. $300. We have some for more; a few for less.

Need a Bull?

Write and ask us how to get the use of a good bull for two years, sired by a 34-lb. bull—KING SUPERBA, 176125, or PABST KING PONTIAC LAD 129298, and dams with 7-day and yearly records. **Dr. David Roberts Stock Farm, Waukesha, Wisconsin.**

KING SUPERBA

Those who did not meet his sons and daughters at the Wisconsin State Fair have seen by the report in agricultural papers how they took the firsts and Junior champion. Individually they are correct, from A. R. O. dams.

W. J. Mann & Sons, R. 1, B. 16, Waukesha, Wis.

BELLEVIEW STOCK FARM

Breeds the big, high producing kind. We are now offering for sale a few good sons and daughters of Aaltje Salo Johanna Pontiac 57169.

E. B. WATROUS, - Troy Center, Wis.

We Offer Three Young Bulls

4 mos. of age sired by Sir Pietertje Ormsby Mercedes 43d whose dam and sire are among the greatest of the breed. They are out of high producing A. R. O. dams. Send for photo and pedigree. Herd on U. S. Accredited List. We will price these bulls cheap because they are young. A good chance for your next year's sire.

HIGH GRADE HOLSTEIN

Calves, either sex, from heavy producers, well marked, 4 to 6 weeks olds, 15-16ths pure. $25 each, crated and shipped to your station. Express and all charges paid here.

Highland View Place, - Whitewater, Wis.

FOR SALE—REGISTERED HOLSTEIN BULL

We still have one dark colored bull about eleven months old, well grown and a splendid individual, show ring type. His two nearest dams average 25 lbs. of butter for seven days, and 700 lbs. for the year, one of them as a two-yr.-old who gave 16,030, lbs. of milk in a year. They will be tested again at their next freshening and we feel very sure that both dams will make at least 30 lbs. He is sired by a grandson of the great King of the Black And Whites. Will make a great bull for somebody. Price $250.00—decidedly reasonable quality, breeding and records considered. Address:

Elm Leaf Stock Farm, Bear Creek, Wisconsin.
James McKone, Proprietor, William Lucia, Mgr.

REGISTERED HOLSTEINS

25 cows due to freshen soon.
25 bred heifers. Also a few bulls.

If you want the best at reasonable prices, it will pay you to write.

DR. BLACKBURN, - CUBA, OHIO.

How About a Herd Sire?

MUTUAL FOBES LONGFIELD DEKOL 82959
A Splendid Son of His For Sale.

The Calf—M. M. Tritomia Fobes Longfield was born Feb. 2, 1918. He is nearly white, as straight as a line, and very well grown.

His Sire—Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters and a large number of younger ones coming on that will be retained in our herd. His sire is one of the good sons of Mooie Mutual DeKol and his dam, a daughter of Homestead Jr. DeKol, made 30.04 lbs. butter, 630.80 lbs. milk in 7 days as a jr. 3-yr.-old; 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days. (World's record when made).

The Dam, Milford Tritomia Fobes Homestead, a daughter of Canary Fobes Bessie Homestead, made 17.35 lbs. butter, 358.2 lbs. milk as a jr. 3-yr.-old; the second dam 17.38 lbs. butter, 408.3 lbs. milk; third dam 22.19 lbs. butter, 488.40 lbs. milk.

This is an excellent combination of breeding, the sire of this youngster and his dam's sire both being from daughters of Homestead Jr. DeKol, both with records above 30 lbs. butter and 600 lbs. milk.

The calf is priced within reach of any small breeder. Write us today for complete information about him.

MILFORD MEADOW'S STOCK FARM, Lake Mills, Wis.

Bull That Will Suit You

ed by Dutchland Colantha Belle Boy whose dam is a 27.5-lb. 3-year-old daughter of Hengerveld De Kol, sire is the great Colantha Johanna Lad. His dam is Johanna Theresa 2d, a granddaughter of Sir Johanna e made 21.68 lbs. butter in 7 days, and 782 lbs. butter, 18,600 lbs. milk in 1 year. Moreover she's a show first as a 4-year-old at the 1911 National Dairy Show. This youngster, just a little over 6 months old, is short and long time records. Individually he's a dandy, nearly half white, just the kind you've been Other young bulls by the same sire and from A. R. O. dams for sale. Write

STOCK FARMS, A. L. Williams, Est., O. A. Williams, Exec. Fond du Lac, Wisconsin.

SALEM STOCK FARM We offer Registered Holsteins and Poland Chinas for sale; 30 choice milk cows, three to s old, in calf to our Junior herd sire, Sir Aaltje Pontiac Hengerveld, a 33.68-lb. bull, f the best individuals in the state. He was Jr. Champion at our Interstate fair. 25 d 12 bulls, three to eighteen months. These are sired by King Segis Pontiac Polkadot grown and nicely marked. This stock is priced to sell in single or car lots. Also offer stock, Wisconsin's greatest herd of Big Type Poland Chinas. Come and see our stock, s for just what you want in Holsteins or Polands. We can please you. Farm located ity Limits.

make room in our barns we a number of cows and heifers cked by large official milk records. They are bred to

IN STAR STOCK FARMS,

Cows and Heifers

our great herd sire, King Korndyke Veeman, whose two nearest dams average over 37 lbs. butter in 7 days. Write for particulars or come to

ED. M. SCHULTZ, Hartford, Wis.

HOLSTEINS Registered and Grade Holsteins of all ages and both sexes for sale. Can furnish several car-loads of excellent females due to freshen this fall, ready for immediate shipment. Several bulls ready for service.

GUERNSEYS We have an excellent lot of grade and pure-bred Guernsey females. Can supply a carload of cows and heifers due to freshen before winter. All in calf to good sires.

PERCHERON HORSES We have several registered fillies and young stallions; also two aged stallions that we will sell for less than their real value if taken at once.

DUROC JERSEYS Anything you want in Duroc Jersey Swine.

All cattle sold on a 60-day retest guarantee. Write us at once before the best ones go.

EDGEWATER STOCK FARM, Fort Atkinson, Wis.

PERFECTION MILKER

The Standard of Quality

THE men who buy the highest class of goods in every line are the men who buy the Perfection Mil The Perfection is recognized among such dairymen as Governor Philipp of Wisconsin, Ex-Gover Haines of Maine, Judge Quarton of Iowa, Dudley N. Hartt of the famous Westlands Farm of New Y and S. K. Herzog & Company of California, as the one milker which surpasses all others for use valuable cows.

With the right method of milking as a basis, the Perfection has been developed, improved and perfected to the where it is recognized as the safest, most reliable milker money can buy today. It is made by expert workmen out o best materials obtainable in the largest exclusive milking machine factory in the world. Every Perfection is backed by ironclad guarantee. With its simple spiral teat cups, its adjustable pulsator and its sanitary, rounded-bottom alumi pail, it sets a standard of mechanical perfection up to which no other milking machine can measure.

Nature's Way

Because the Perfection milks like the calf sucks, it is the milker which is endorsed by dairymen who own valuable cows. The sucking calf first applies a suction, then squeezes the teat towards his throat downward with his tongue and the roof of his mouth, then momentarily stops sucking while swallowing.

The Perfection Teat Cup milks exactly the same way, with a gentle suction, downward squeeze and a period of complete release. Because the action of the Perfection feels natural to the cow, Perfection o report that it increases the milk flow.

Nature's Way of milking exactly like the calf belongs exclusiv the Perfection.

Whether you own ten or one hundred cows you should the milking machine and learn how to take advantage of it. Milch c America today are worth twice what they were before the war.

Valuable Book Free

From the experience of hundreds of dairymen, we have prepared the valuable book, "What the Dairyman Wants to Know", which answers every question you can ask about milking machines. N word of theory—just straight-from-the-shoulder *information.* today for your free copy, together with names and addresses of dairymen owning Perfections.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

North Carolina Short Course

A three weeks' course in agriculture will be held at the North Carolina College of Agriculture, January 9 to 30. The course is open to all interested in farming, and its object is to better fit men for life by aiding them to secure higher skill, efficiency, and knowledge in their chosen field of endeavor. Further information will be supplied on request by E. B. Owen, Registrar, West Raleigh, N. C.

With Rutabagas and Silage

HOARD'S DAIRYMAN:—Please balance a ration of the following feeds. I have on hand hay, mostly timothy, bran, ground oats, rutabagas, and pea silage from canning factory. This is for Holstein cows coming fresh in November and December. Could I improve this, and what feeds would you advise?

Rice Lake, Wis. V. J. B.

We would feed the cows about 20 lbs. of the pea silage and 20 to 25 lbs. of the rutabagas daily. Besides this, let them have a liberal allowance of the timothy hay. A mixture consisting of 200 lbs. bran, 200 lbs. ground oats, 300 lbs. corn or barley, and 100 lbs. oil meal will supplement the roughage very well. Feed about 1 pound of this mixture for each 3½ to 4 lbs. of milk produced.

If some of the cows are very heavy milkers, it would be well to give them from one-half to one pound of oil meal daily besides that which is in the ration. The ration we have suggested is not strong in protein and it would not be out of place if 100 lbs. of gluten feed, or some other feed equally rich in protein, were added to the mixture. This is particularly true if the cows are fresh and are doing exceptionally well at the pail.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The New Year

The New Year! The New Year!
With all its suns a-shining,
And peace has put new buds to seed—
The clouds a silver lining.
There never was a time on earth,
That men and soil were nearer.
Clods ripple to the day with mirth
And all God's walks are dearer.

The New Year! The Better Year!
The year of peaceful waking.
At dawn, a world of birds we hear
Their humble fare partaking.
Our farms are beautiful to see,
And crops are merely sleeping;
I'd rather hark, a honey bee
Than all th' nation's weeping.

The New Year! The Peace Year!
We'll soon be at our plowing.
And branches loaded down with bloom
Across the meadow bowing.
War was the winter of our lives,
And peace that breath o' spring,
When earth, reborn, from all its hives
Come forth to smile and sing.

When the Boy Came Home

(Some of the first things he did)

Looked the new barn over from top to bottom.

Said "howdy" to the herd.

Had a good squint at the calves.

Drank a quart of fresh buttermilk.

Spread butter mighty thick on his bread.

Begged to be allowed to operate the cream separator.

Snow or no snow, walked over to the meadow.

Got into his working clothes and made a bee line for the dairy.

Some Good Resolutions

Nothing but pure-bred stock after this.

Cement or concrete wherever it can be used.

A new silo—and more respect for corn.

Clear a few more acres of rough ground.

A cream separator because it will bring greater profits.

An appreciation of the fact that hogs can be kept clean.

Consider every rat about the place an enemy.

Give the boys about the place enough genuine responsibility to make them love to remain there.

Keep all machinery under some sort of shed.

"If this war had accomplished one thing only," said Uncle Millet, of Cloverdale Farm, "it was well worth while—the bringing of all peoples everywhere to understand how necessary farms and farmers are to the progress of the world."

Her Boy is Back!

The bossy seems to know that Jim
Is back from overseas.
She always loved th' sight of him,
Especially, when lanes were dim
With overhanging trees.
He'd walk with her, a mile or so,
To meadows, fair and sweet.
And even patient Jerseys know
Th' friendships that they meet.

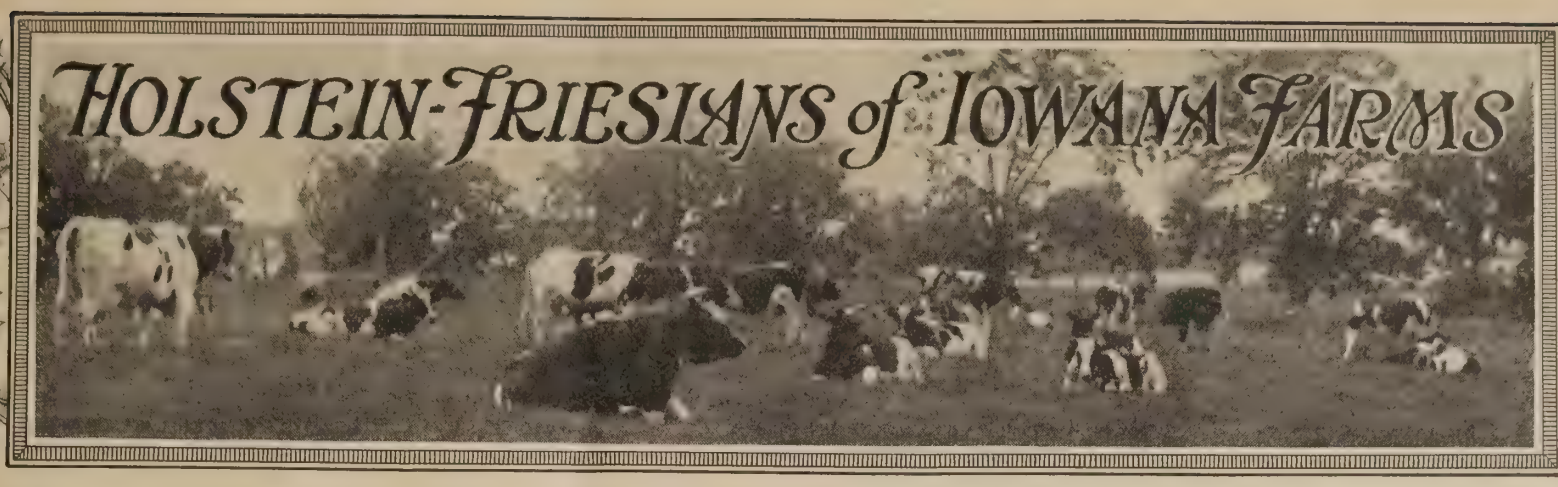
He couldn't wait to reach th' barn,
And see that Jersey cow.
He spun a "Glad-to-meet-you" yarn,
And spoke of fightin' on th' Marne,
Of racket and of row.
'Twas just as if she understood,
His language and his tale.
She'd nod her head and sort o' "Moo,"
A "Gee-I'm-glad-my-boy-it's-you,"
—and kicked th' milkin' pail.

Jim always treated her, I guess,
Half human like—and fair.
He'd pet her—see her to her stall,
And watch her grub and coat—and all,
With tender love and care.
And now that he is back once more,
And in his workin' clothes,
She's skittish as a five-year-old,
And—if the truth of it is told—
She's kissed him with her nose!

98%

Of the World's Creameries use exclusively DE LAVAL CREAM SEPARATORS

That one fact alone is sufficient reason for your choice of a De Laval.



The Creameryman handles millions of pounds of milk and he has found out from experience that no other cream separator will skim so clean or wear so long as the De Laval.

"Claims" don't fool the creameryman. He goes on "performance". Why not you too?

For catalog or any desired information see the local De Laval agent, or write to our nearest office.

The De Laval Separator Co.

OVER 2,325,000 DE LAVALS IN DAILY USE

HE herd of Holstein-Friesians at Iowana Farms, owned by Col. G. Watson French of a, is managed on the supposition ; the progressive business dairy- and farmers are interested not nuch in what a cow can do in sev- days under high pressure as in t she will do during the other 358 s of the year under normal condi- s. Forcing for a large seven-day rd is not allowed as they believe abnormally high fat percentage he seven-day record, as it is so n made, results in a record that

COL. G. WATSON FRENCH

o criterion of the cow's producing ity and they pay but little atten- to the seven-day record.

he Iowana Farms make this state- t in their catalogue:

Although we recognize the great ie to the breed and to the individu- animal of the official record, yet most emphatically do not believe he policy of the long time prepa- on and the short time test. The e and physiological condition of ly dairy cows is such that a large unt of fat can be stored within r bodily tissues and then be trans- ned into milk fat, during the early t of the lactation period, so rapid- as to produce milk containing an ormal percentage of butterfat, and so doing produce in the first few days after freshening abnormally large butter records. Since this method of making large seven-day fat records has been known and practiced, few indeed are the cows making world's records in the seven-day division that have been able to maintain their lead through the year. Though we are carrying on official test work practically all the time, yet it is doubtful if we ever make phenomenally large seven-day records. We do, however, demand a high average yearly production for the entire herd, working under normal conditions."

Iowana has comparatively little to say about their best cows, believing that the basis of judgment should be the average of the entire herd. This average for past twelve months for forty-eight cows, which includes every animal of milking age in the herd, is 400 pounds fat from 11,850 pounds milk. This includes cows up to fifteen years old as well as seven heifers with first calf, one of these good old breeding dams giving milk from only one quarter, several others from two and three quarters, and five of them were on the show circuit during the year. In addition to this showing in milk production the herd is noted for its winnings at the prominent shows, fully demonstrating the possibility of combining in one animal the two characteristics of heavy yearly production with beauty of form.

At the head of this herd is the well known sire, Sir Johanna Fayne 42147, an animal that combines the three essentials of a great dairy sire; first, correct type: as scored by three of the most prominent Holstein judges in this country he averaged 96.75, not in show condition but as he was found in his paddock with no preparation whatever; second, the ability to transmit type to his offspring: many of his sons and daughters have been winners at the big dairy shows; third, the sire of daughters that are heavy and persistent producers: he is the only bull living that has four daughters with records above 23,000 pounds milk in a year or seven above 20,000; the average of all tested daughters, four years old or over, is 663 pounds fat from 21,441 pounds milk in 365 days; the average of all two-year-olds tested is 399

[Continued on page 774]

ERADICATION OF DISEASE FROM THE FARM

H. J. WASHBURN
BUREAU OF ANIMAL INDUSTRY

AN ounce of prevention is still worth a pound of cure, therefore the most important steps in gaining an assurance that all the stock upon any particular farm is free from disease should consist of measures that are effective in preventing disease from gaining access to the premises. For instance, suppose that a farmer hears that hog cholera or foot and mouth disease had made its appearance on the premises of one of his neighbors, and he visits the place for the purpose of "Seeing how the sick animals look". This may easily result in his bringing the infection back to his own farm. Many a valuable herd or flock has been lost as a result of some similar form of idle curiosity.

Good Breeding Stock, Feed, and Management Essential

Start with sound, thrifty breeding stock on the principle that like begets like. Some diseases are hereditary, or at least a predisposition towards the development of these diseases may be passed from mother to offspring, but aside from the consideration of hereditary ailments, the general principles of successful breeding require strong, healthy foundation stock, and once this has been secured it should be provided with suitable nourishment at all seasons of the year. An abundant supply of clean drinking water is another of the requirements of profitable stock raising. During wintry weather the animals should be allowed to occupy stables that are warm and comfortable, but at the same time sufficiently ventilated so that there is enough uncontaminated air for all the animals. Ventilating systems are quite essential for the conservation of health when large herds or flocks are kept in one building. Hygienic experts and practical stockmen have developed ventilating appliances that supply the animals in stables with fresh air without permitting the entrance of an undesirable amount of cold. The farmer, however, should give them particular attention, especially on stormy days, to make sure that none of the animals standing within range of the discharge pipes shall become chilled through the entrance of too great a volume of air from without. Forceful evidence of the practical value of ventilation may be found in the regulations formulated at the present time by health officers in their fight against Spanish influenza. The first of their recommendations calls for the opening of doors and windows.

Where only small numbers of animals are kept in one enclosure, it is usually unnecessary to provide greater ventilating facilities than those afforded by doors and windows.

Horses, cattle, and sheep should be provided with salt. Some farmers are negligent in this matter. Physiologically, salt is needed to assist in the digestion of the forage eaten and to add needed elements to its nutritive values.

The tendency shown in the work of the medical investigators during recent years has been toward the perfection of means for preventing disease rather than toward the discovery of remedies for curing diseases that have already developed. As evidence of this, note the advances made in the prevention of typhoid fever, Texas fever, rabies, and hog cholera. Preventive means can be applied to a large number of people or animals at one time, whereas the treatment of diseased individuals must of necessity be limited to a few. More important still, preventive measures, if successfully applied, leave the individual that has been protected in a strong, healthy condition, while the patient that has been cured of an actual attack of disease will be more or less depleted and weakened. The advantage derived from the maintenance of a strong, healthy condition throughout the entire year will be appreciated at once by the stockman who has had experience in coddling and building up an animal that has been reduced by disease. The man having live stock in his care should profit by the experience of those engaged in medical research, and as a means of preventing disease should give careful attention to the feed, water, and stables or quarters provided for his animals.

Administering Medicinal Remedies

Even with vigorous foundation stock secured, and after the employment of preventive measures to the best of the owner's ability, accidents may happen and disease may unexpectedly gain a foothold upon the premises. Therefore it is desirable that those having stock in their care should understand the most effective methods of giving medicines, and some of the dangers that may arise from their improper administration.

There are several methods of applying remedies to the ailing animal, but giving them by the mouth, by the breathing organs, and by the skin are the only ones that need be considered here. Medicines that can be finely pulverized will often be eaten if mixed with a bran mash or given with dry ground feed. This method has many advantages and should be used whenever possible. The druggist will prepare some remedies in a ball, elongated pill, or in a gelatine capsule if requested to do so, and in this form they may be given quickly and without causing much resistance on the part of the animal if the operator understands the proper way of placing the medicine in the back part of the mouth where it must, of necessity, be swallowed. A drink of water should be offered as soon as a ball or capsule has been given to prevent coughing it out. Some mild remedies may be mixed with honey or molasses and placed upon the animal's tongue with a paddle or flattened spoon.

It is sometimes necessary to give medicines in considerable quantity and in liquid form. They should then be thoroughly diluted in water or oil, and may be given from a strong, smooth bottle, or from a horn or tin appliance. A quiet horse, for instance, may sometimes be drenched by one man who raises the animal's head and holds it up with his left hand while he pours the medicine into the mouth with his right. However, more forcible means of restraint will be required in most cases before a drench can be given effectively. An assistant should hold the head of the animal elevated by means of a fork, one of the tines of which has been passed through beneath the noseband of the halter, or a strap or rope may be fastened to the noseband and then passed over a beam, the limb of a tree, or through an elevated pulley. A loop in the end of a rope may be placed on the upper jaw just back of the tusks, and by passing the free end of the rope over a beam or through an elevated pulley the head may be raised to the required position, which is to have the line of the face on a level or slightly higher. The free end of the rope should never be fastened while medicines are being administered. The head being raised a suitable position, the bottle may placed in one side of the mouth j in front of the molar teeth. Progre ing slowly, and only attempting give a little of the liquid at a ti between intervals which allow the a mal to swallow quietly, the whole the drench may be given safely wi out causing the liquid to pass into lungs, where it might cause the de of the animal by setting up incura pneumonia.

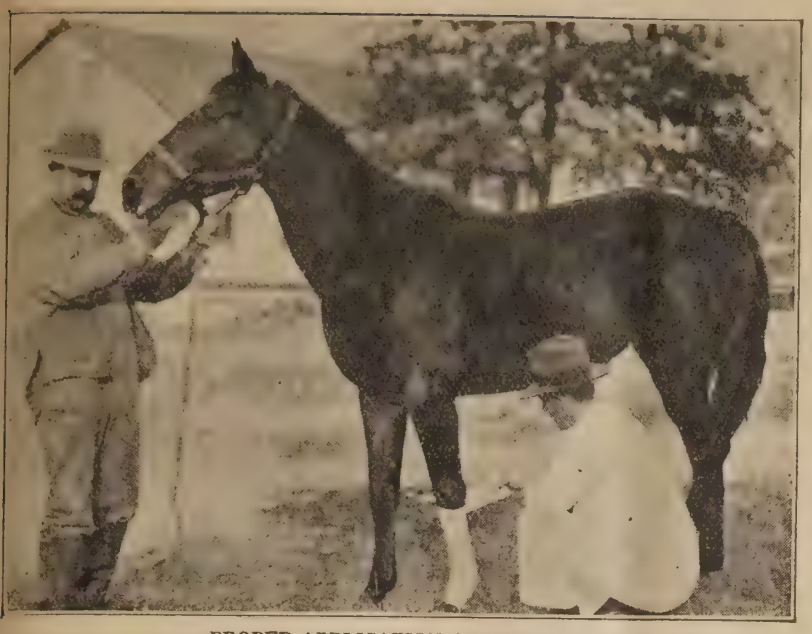
Cattle are easily drenched by h ing the head held in position by assistant, when the remedy may slowly administered.

In drenching sheep it is often visable to make use of an applia consisting of a small rubber t about 3 feet long and three-eig of an inch in diameter, a funnel wh is fastened to one end of the t and a mouthpiece of brass th eighths of an inch in diameter about 9 inches long which is attac to the other end of the rubber t The sheep should be allowed to st on all four feet while being drenc The head having been raised until face is on a level, the metal mo piece is inserted at one side of mouth and the desired amount medicine is slowly poured into funnel which is held in proper tion by an assistant.

Should any animal begin to c while being drenched, its head sh be released at once, and it shoul allowed to rest quietly until it ha covered from the attack. Dren should always be given by wa the mouth, and not through on the nostrils, as is the practice in tain sections.

The inhalation of vapors is s times used to great advantag treating influenza of horses and A bucket of hot water to which tar, iodine, carbolic acid, or medicines have been added is p in the bottom of a long grain The top of the bag is then he place around the horse's nose a the medicated steam is generat is drawn into the animal's respir organs with softening and reli effect. It should not be hot en to scald the horse.

Treating Wounds

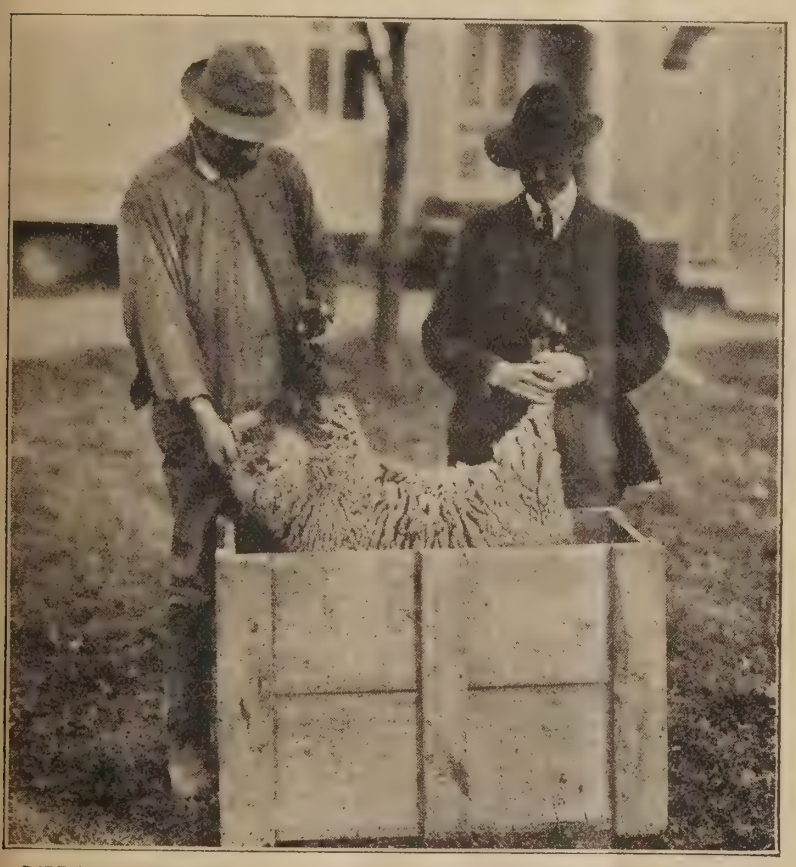


The treatment of wounds must according to the nature and se of the injury. Simple laceratio the skin may be washed and cle by the use of a preparation of ide of zinc, 10 grains to each ou water. No bandages should b plied to simple skin injuries they are necessary to keep fli of the wound.

A more serious and rather co injury results from the punctu the foot by a nail, wire, or sharp object. Should an accid this nature occur the nail, if s the foot, should be removed a as possible. A qualified veteri should be called promptly to e the wound and proceed with s treatment.

Injuries to the skin in whi deeper tissues are involved, and

AN APPARENTLY HEALTHY COW AFFECTED WITH TUBERCULOSIS



She does not cough, her appetite is good, she gives a large quantity of milk, and is in excellent general condition for a dairy cow. At the time the picture was taken it was known that she had been affected with tuberculosis at least four years and that she had been passing tuberculosis germs from her body at least three years. The mixed dung of this and a similar cow caused tuberculosis in hogs that were permitted to follow her.

PROPER APPLICATION OF BANDAGE
No bandages should be applied to simple skin injuries unless they are necessary to keep flies out of the wounds.

DRENCHING A HORSE
A quiet horse may sometimes be drenched by one man, but in most cases more forcible means of restraint will be required before a drench can be given effectively.

DIPPING SHEEP, WHERE BUT A SMALL NUMBER ARE TO BE TREATED

GIVING LIQUID MEDICINE TO SHEEP
Drenches should always be given by way of the mouth and not through one of the nostrils as is the practice in certain sections.

nich abscesses or ulcers may or may ›t have developed, should be care-.lly washed out with a disinfecting lution, for which 3 per cent of car-›lic acid, 1 to 1,000 bichloride of ercury, or 1 per cent solution of po-ssium permanganate may be used. axseed poultices are sometimes of lvantage on abscess formations af-r they have opened. After the ›und is well cleaned a healing dress-g, such as carbolized vaseline, or cric acid 2 parts, alcohol 40 parts, id water 400 parts, may be applied ›on a pad of absorbent cotton, sup-rted by a bandage. The bandage in ese cases should be readjusted ice daily until healing has become tablished.

Medicines intended for fowls should ways be prepared in such a manner at they can be given in a grain ash or in drinking water. Even ose that have a disagreeable taste odor will often be taken by fowls their feed or water without hesi-tion.

Attention given to providing clean, y stables for stock during those sea-ns of the year in which they are abled continuously will have much do in preventing such troubles as rush and foul feet. Careful atten-›n to feeding will prevent most ses of bloating in adult cattle and scours in calves. Many feeders make the mistake of giving their young calves feed that has not been properly warmed, and troublesome diarrhoea results.

Treatment of Parasites

Parasites of various kinds exact exceedingly heavy toll from our farm animals every season. Bloodsucking flies and mosquitoes torment horses and cattle, from which they draw the vital fluid. They collect an enormous revenue from the stock owner, for they not only rob their hosts of their life-giving elements but they subject them to continuous action and exertion as they stamp and thresh about in their efforts to drive away their tormentors. Lice, ticks, and visceral worms also do incalculable damage to farm animals, although their presence may not be so readily determined.

Much may be done to reduce the harm caused by flies and mosquitoes through the use of chemical repellents, blankets, screened stable windows and doors, and the like. There in great need of more effective methods of protecting live stock from them and it is hoped that some satisfactory means of destroying them may soon be discovered.

Dipping and bathing or spraying with suitable disinfectants will remove the ticks and lice, while lung worms and stomach worms may be kept in control if not completely removed from calves, sheep, and hogs through the persistent application of remedies to suit each case.

When we come to infectious diseases we are confronted by quite a different proposition, and measures that will prevent the spread of the disease from the affected animals to healthy stock must be applied.

Tuberculosis

Tuberculosis is probably the most widely spread of all infectious diseases and affects cattle, hogs, and poultry. No outward signs indicate that an animal is tuberculous during the early stages of its infection, but if the case is allowed to progress, unmistakable evidences of wasting will appear, and the death of the animal will follow. In addition to the loss of the affected animal there is great probability that others have become infected during the later stages of its disease, since the usual course of tuberculosis demands the growth of tuberculous masses within the body, their degeneration, rupture, and the scattering of the countless tubercle bacilli which they contain. Thus other animals kept in the same enclosure with the tuberculous one take up the germs of tuberculosis, and new centers of tuberculous growth, decay, and death are formed. In this way a tuberculous cow may infect several healthy cattle in the same herd by means of the infectious material which she coughs up; at the same time she may be the source of infection for a drove of hogs that are allowed to run about the farmyard with the cattle or from drinking milk in which tubercle bacilli have become suspended.

Should the owner of the affected cow be trying to raise a few choice calves, there is great danger that they will become tuberculous if fed milk from the diseased cow after her tubercles have broken down. Having noted the effects of feeding this milk to hogs, can we doubt that calves will become tuberculous if fed upon portions of the same product? Why should they not? There are numerous living tubercle bacilli suspended in such milk at nearly every milking. They only need planting in suitable soil to multiply and produce other like tubercles, and the calf affords ideal conditions for such reproduction. Aside from this economic phase of tuberculosis, it should not be forgotten that the disease is also trans-

(Continued on page 778)

Substitutes for Butter

HOARD'S DAIRYMAN:—In a full page display of a great national weekly is an advertisement which is well worth the study and consideration of every dairy farmer, for it brings to light some interesting things. It is an attractive advertisement of an article that, says the advertisement, "serves your purpose as well as the finest butter".

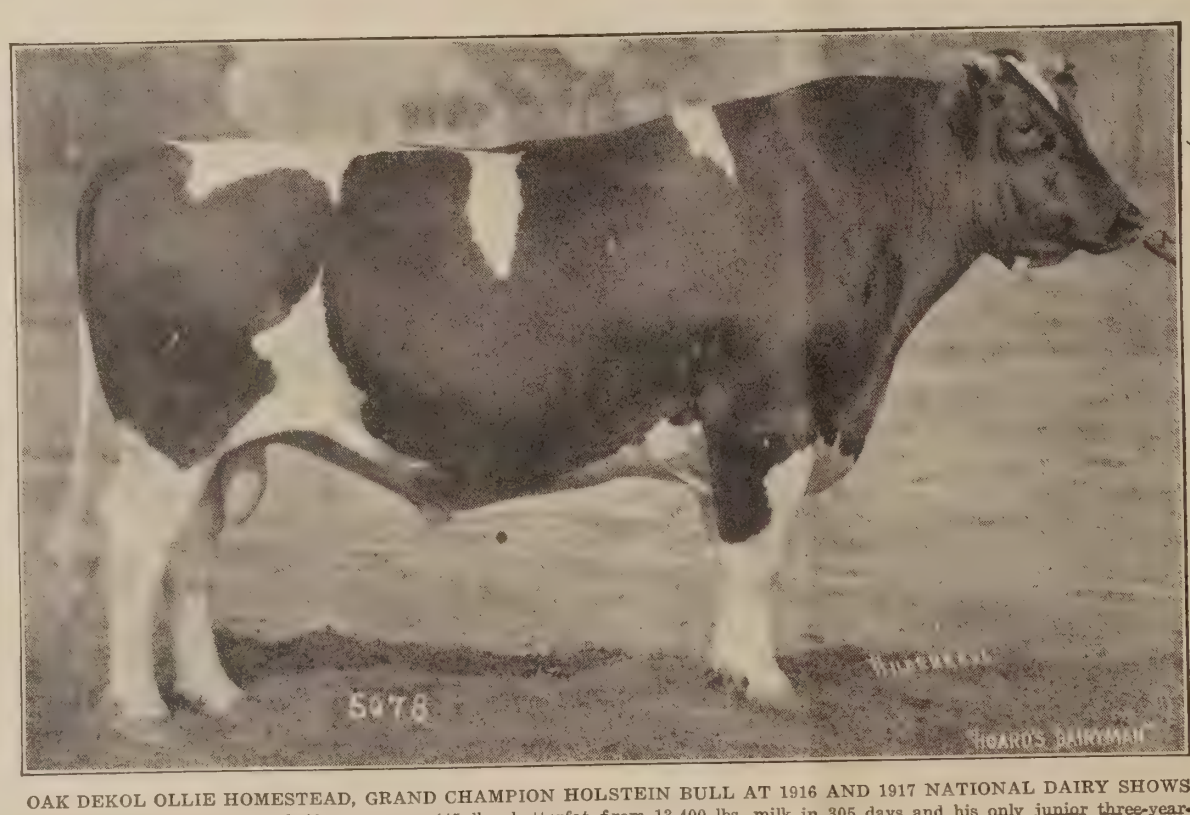
People will pause to read such attractively worded and displayed advertisements and will be greatly tempted to test the merits of the article. You cannot blame them. They have faith in present day advertising, and I believe they would read just as eagerly the merits of good, pure, wholesome butter if they were set forth as convincingly as that of so-called butter substitutes. Suppose, for instance, we show the real food value in butter as compared to other foods or substitutes; the consumer becomes interested right away. Let us go even further than that; show a neat package or plate of butter in colors which will draw the eye.

Suppose a cut of a carton of butter were shown in its full size and let one-half of the carton be laid back revealing the contents in its rich golden color. There you have a display that will make the mouth water and get the reader's attention. I recall a certain dealer who desired to build up a good trade with farmers; he offered to take all their butter and eggs at the highest market price, offering either cash or trade in groceries. He received more butter than he could sell to his city customers, so he conceived the idea of displaying all his choice colored butter in an ice-cooled window. His butter was not done up in packages, but its rich golden color proved to be the best advertisement he could make.

Why do people buy substitutes in preference to the real article? This is not a puzzling question when you begin to pursue it and ask the consumers themselves. Many have told me that substitutes could not be told from butter "if you didn't know the difference". They were the same color, you could cook and bake with them, they were harmless because they were made of animal or vegetable fats—they did not know which—and they were cheaper. But when it was explained how butter was superior as a food they said: "Well, I didn't know that. I confess I didn't know anything about these substitutes."

And there you have the gist of the matter: they didn't know. The American people are readers of advertisements; I have met many who said they often read as much as the advertisement columns as of the reading matter. The American people, especially those in the cities who are the great buyers of butter, would appreciate knowing more about this product of the farms. They will read more about it when butter is presented in the proper light and its merits proven to them in substantial words and figures. Such a display will incite them to serious thinking over the matter. Let it be plain, simple, understandable, without any attempt toward exaggeration.

Folks are coming to use butter substitutes more and more. While there is still a good demand for butter, this demand may grow less if some steps are not taken to show why it is an essential food, a wholesome food, a food that cannot be equalled by any manufactured so-called substitute. Butter substitutes are not served in hospitals to the sick, nor do our scientists and doctors recommend it. The answer is obvious.



Indiana. J. L. JUSTICE.

Holstein-Friesians of Iowana Farms

(Continued from page 771)

pounds fat from 12,884 pounds milk in 305 days or ten months.

The other sire at Iowana is Oak DeKol Ollie Homestead 85529. He has the same combination of essential characteristics as Sir Johanna Fayne, —first, correct type: he was grand champion at the National Dairy Show in 1916 and 1917; second, sire of animals of correct type: four of his sons were the sensational winners of the coveted "Get of Sire" prize at the National Dairy Show in 1917; third, sire of heavy yearly producers: his two-year-olds average 445 pounds butterfat from 13,400 pounds milk in 305 days, and his only junior three-year-old daughter has a record of 737 pounds butterfat from 18,122 pounds milk in 365 days.

OAK DEKOL OLLIE HOMESTEAD, GRAND CHAMPION HOLSTEIN BULL AT 1916 AND 1917 NATIONAL DAIRY SHOWS
This bull's two-year-old heifers average 445 lbs. butterfat from 13,400 lbs. milk in 305 days and his only junior three-year-old daughter has a record of 737 lbs. fat from 18,122 lbs. milk in 365 days.
OWNED BY IOWANA FARMS, IOWA

The milking herd at Iowana is not pampered but fed under good ordinary farm conditions on ensilage, alfalfa or clover, and one pound of grain mixture for each three and one-half pounds of milk produced.

The breeding of this herd so meets our conception of true, constructive breeding that we have given it editorial mention.

Oleo Fiction vs. Butter Truth

HOARD'S DAIRYMAN:—The open feud between oleomargarine and butter still wages hot and furiously. Neither side has any idea of taking the count, so it is up to the consuming public to act as referee. The public at present is inclined to favor oleo because the latter is a smooth talker, self confident and braggy, and is always thrusting himself forward in the most approved fashion and into the good graces and favor of all those who are obliged to get the utmost out of every dollar. In a November Saturday Evening Post a striking full page advertisement of a certain brand of oleomargarine appears, and although oleo people have always been inclined to gild the lily and make black white, they quite excel themselves in this artful "ad", and, as usual, genuine butter is the goat.

Their selling talk in that issue of the Post reads: "1 pound certified oleomargarine plus 1 thrift stamp equals 1 pound butter. Every time you buy a pound of our certified oleomargarine, you not only save enough money to buy another thrift stamp but you are getting a product that serves your purpose as well as the finest butter."

I call this insidious advertising; in fact, I should call their brand of talk as misleading as their product, in that a pound of oleo plus a thrift stamp does not equal a pound of honest butter, nor ever will. We are now, thanks to Dr. McCollum, thoroughly posted on the merits of oleo and butter. While their fat content may be practically the same, their life-giving and keeping properties are in no way comparable, the advantage being all on the side of butter.

I would like to possess money enough to buy up the opposite page in any publication where this oleo "ad" occurs and use it for the one and sole purpose of defending and exalting butter. There would probably be no object in trying to blackmail oleo, yet I believe so thoroughly in the mighty facts with which men of science have equipped us in regard to butter's superior qualifications that there is no doubt in my mind but that facts alone, if put before the public on the scale the substitutes' merits are, would in six cases out of ten win back our legitimate market.

As it is, it seems decidedly short-sighted to let the oleo people "get away" with this sort of advertising. It pays to advertise, you know, and the substitute makers have certainly proved it thrice over.

I wish we could talk face to face with the great American consumer and prove to him in print that oleo is nothing but an "also ran". We could talk to him in our full page dairy ad something like this:

"One pound butter at market price equals health safety. Buy butter instead of substitutes. Save doctor's bills and then buy thrift stamps. You run a mighty risk if you deprive you children and yourself of the growth promoting substances found abundantly in milk fat but not in vegetable fats.

"You have heard of the wonderful vitamine or fat soluble A. When you buy real butter (not oleos, nut butters, etc.,) you have these magic properties at their greatest and best —and yet they are beyond price in reality.

"Dr. McCollum of Johns Hopkins one of the greatest scientists and human benefactors that ever lived, has the following to say about dairy products: Milk is an indispensable article in the diet of any people who wish to achieve. Without the continued use of milk, not only for the feeding of our children but in liberal amounts in cookery and as an adjutant to our diet, we cannot as a nation maintain the position as a world power to which we have arisen.

"Strong and thought-provoking words, those. Butter is made from pasteurized cream, not a mixture of oils and fats of doubtful origin.

"At any price, you can afford butter because nothing can take its place. Butter is first in flavor, and first in health-safety."

Steps are now slowly but surely being taken to get into this great advertising game, and in time, dairy products will be nationally advertised as well as their rivals. The state of Wisconsin has taken the lead in this matter and it is to be hoped that other great dairy states will become enough interested to put the thing through.

The substitute butter men have continued to wax bold in their claims of "just as good" or better, because they think the lack and will lack the sinews of advertising and publicity.

I think that the American public is not discriminating, too censirous of the best, to let a few cents a pound difference stand in the way of their own interests when all the great facts about butter are before them.

They will hasten to retrieve the errors in butter buying in the past and will not be content to jeopardize their children's health and natural birthright by depriving them of the "magics" in milk and butter. But we cannot expect busy and indifferent people to search these things out for themselves. Advertising, when forcefully, cleverly, and attractively done is the only weapon by which to conquer their inherent bargain trait. You do not bargain when good health and right living are at stake and neither will the average American consumer when he thoroughly understands how valuable and priceless "fat soluble A" is. He may have heard of these things in a perfunctory way, but he won't be interested and moved to action until we strike him for big game.

The average American will quickly show himself to be discerning, discriminating, and full of wisdom. He will use milk and butter on the table as he never did before, the price having little to do with it, and if anything has to be gone without, it will be dairy products. But all this is in the future. We have got to present our cause consecutively and for many months before our dairy maid dreams come true. Meanwhile,

l fellows keep winning new re-
rts away from us every day and
lo not raise a finger, comparative-
to prove our mighty products be-
d price.

certainly makes me doubt the
llibility of sums and arithme-
when Wilson and Company add
ound of oleo and a thrift stamp
ther and get—butter!

American Farming in Serbia

everal thousand acres of Ameri-
winter wheat have been seeded in
Monastir Valley, Serbia, as a
ilt of the efforts of an agricultural
of the American Red Cross that
ved there last spring.

he land has been plowed and
ivated with American twenty
se-power tractors drawing Ameri-
gang plows and harrows. The
in will be harvested by American
vesters and made into flour for the
gry Serbians in two American
r mills.

ast April when the mission of
iculture experts left for the Bal-
s they took with them $249,000
th of farm tools and seeds. The
hinery included twenty-five Amer-
twenty horse-power tractors, 45
vers, 45 drills, 25 harvesting ma-
es, 2 threshing machines, and
sands of smaller implements and
s. Two flour mills are now on
r way over. In addition the unit
with it two complete saw mills
turning trees into building ma-
al, and the most complete gasoline
ever seen in the Balkans.

he Serbian government permitted
Red Cross men to use on the farm
in the shop any men not fitted
fighting in the army. The Serbian
norities collected a group of the
mechanics and farm workers to
ound among the sick and wounded.
y then assigned to the Americans
old bandit town of Kremljani
ch had been deserted since 1912.
s town was the stronghold of a
dit organization that held many
ple for ransom and so terrified
country as to stop the develop-
t of the fertile Monastir Valley.
1912 the Serbians attacked the
e and a pitched battle ensued
ch ended in the death of many of
robbers and in the flight of the
to the Turkish army. The land
nging to the village, some 50,000
s, was confiscated. This land
turned over to the American Red
ss with permission to cultivate as
h of it as they could handle.

he Red Cross farmers announced
they would plant as many thous-
acres to winter wheat during the
or rainy season as could be
ved. The Serbians said that not
y acres could be put under crop as
equired six people by their meth-
to work an acre and they had
40,000 men in their entire army.
Americans replied that with their
ern machinery only 150 men
ld be needed to raise 200,000
els of wheat.

hen the machinery began to
ve from Salonika, the first job
to train the Serbian mechanics
ut the machines together and to
ate them. The tractors were in-
able as in the whole 200 square
s of the thickly populated valley
about 600 oxen remain and there
no horses. Seven big Italian tents
e put up to house the machinery.
r other tents contain the machine
, carpenter shop, and other
mbly and repair units. The Ser-
workmen were enthusiastic over
modern tools and learned rapidly
to operate them.

he men lived in tents and were
from a tent kitchen. The plant
managed from a tent office. The
en, however, was a problem. The Serb wants red pepper in everything and the Red Cross men had great difficulty in convincing the cooks that American stomachs object to such treatment. A cook who had been in America was finally obtained and he saved many a stomach from destruction. Regular Pittsburgh boarding house hash and boarding house steak were on the menu frequently. Pepper was left out but onions were frequent.

Winter wheat will yield from 20 to 30 bushels to the acre in Macedonia and the relief commission expects to be able to supply flour to thousands of Serbian families next spring. The hand tools, small plows, and cultivators, rye, oats, and potato seed, are being distributed to farmers in the valley who are cultivating by hand. The barley that was being sent over for seed was sunk by a submarine.

Grain is very important as the Serb is a ravenous bread eater. He can live for months without meat if he only has bread and a few tomatoes, peppers, and cabbages. Without the vegetables planted by the Bulgars behind the lines the Serbians would have been unable to make any headway with their drive. They went ahead so fast that their supply trains were unable to keep up. For four days during the pursuit they lived on chance vegetables, at times without bread or water.

The Serbians on the Red Cross project are all learning to use modern farm machinery and to adopt the American methods of growing winter wheat, but the majority must of course continue to use hand methods until they can bring in oxen from Italy or Greece. Their great need everywhere is for all kinds of farm tools and building outfits. The Austrians took away nearly all the cattle and left scarcely any tools. Crops are brought in from the fields on the backs of the family. Carpentry tools are now needed to rebuild homes and to make furniture, as the four previous Balkan wars and the great war have completely desolated most of the rural homes. Needles and thread are entirely lacking, which explains the torn and unpatched condition of the villagers.

New farm tools promise a food supply for the future. The metal workers from America who had returned before the war or the several thousand who slipped over from the United States and, with the Serbian army, played an important part in the last offensive, brought over a good deal of money.

American gold and other money is plentiful in Albania and Macedonia, but it is not valued very highly. One woman, when asked why she begged for food when she was wearing gold ear-rings, threw a handful of gold coins on the table, saying: "They are only good for the children to play with. Gold cannot buy food where there is no food to buy."

But there will be food. The Red Cross agricultural unit is raising it on a wholesale scale as we raise it in this country.—AMERICAN RED CROSS.

Ten community canning centers are the excellent start the boys' and girls' clubs have made in Spokane County, Washington, under the direction of the Department of Agriculture and the state agricultural college. These have been operated all summer by the boys and girls with the greatest of enthusiasm. Some of the women in the county also are using the centers. The wholesalers have agreed to buy all the products of the Spokane County centers which come up to the standards set by the state and county club leaders.—Food and Farming Weekly, No. 29.

1881—1919

Looking Backward and Looking Ahead!

THE Sharples institution is now entering its 38th year of service to the Farmer and Dairyman. They have been years of pioneer work in improving two of the greatest aids to the dairy industry—the separator and the milker machine.

Today the Sharples Suction-feed Separator is recognized the world over as the ***only*** separator that skims clean at any speed.

Likewise, the Sharples Milker is the only one that applies any squeeze or pressure to the teats.

Worldwide acceptance of these pioneer inventions has made the Sharples factories the most extensive of their kind. The Sharples institution is also the largest American-owned separator and milker business in the United States.

But past success is only a stepping stone. We believe that Dairying will become the world's most useful, most profitable industry and in this future era of tremendous progress, the Sharples institution will be ready to meet every demand made upon it.

It is gratifying to be associated with and contributing toward the growth of one of the mainstays of the human race—***the dairy.***

We extend to farmers and dairymen everywhere, a most cordial New Year's greeting.

P. M. SHARPLES,
President.

SATISFIED USERS wrote this Ad for Us—

Their Experience is worth real Money to YOU!

I have owned three spreaders in my time. The first two I didn't think much of. Then I got one of yours and now I am more than pleased with the spreader proposition. I find by hauling manure in the winter time on clover sod and letting the rains leach it down before plowing it under will oftimes double the corn yield or even wheat. Where I used commercial fertilizer and barnyard manure together on 12 acres of wheat last year I got 600 bushels of wheat, an average of 50 bushels per acre. A farmer that owns ten acres can't afford to be without a spreader.

WILL HENSIL, Ohio.

I have had several spreaders on my farm, but there are none like yours. I could not farm without it. Last fall I put six acres to wheat, first putting on 30 loads of manure. This spring I put on 20 loads more. You just ought to see that wheat. The manure made it stool out very good, and it will give 35 bushels per acre. If I had not used the Spreader this spring I am sure I would not have gotten over 15 bushels. Your spreader is one of the best investments you can put on the farm.

C. E. HUPRICH, Ohio.

I would not be without your Spreader, because it saves so much labor, puts the manure on the ground evenly, and I can spread any kind of straw or cornstalks. I believe my spreader will pay for itself in two seasons. With the proper use of manure on my place and using lime, I have increased the yield of my farm 25% in six years.

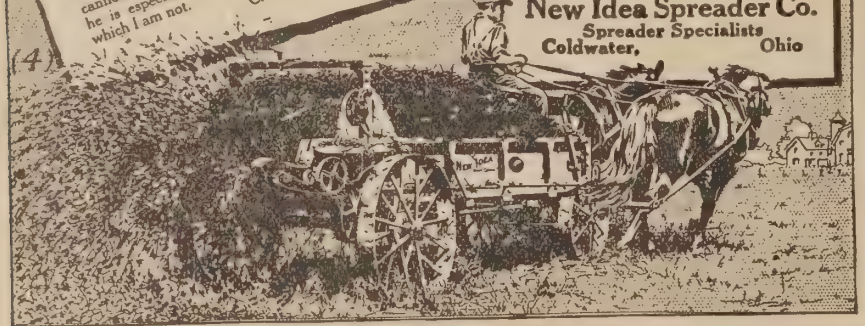
E. M. PHILLIPPE, Virginia.

Your Spreader has given entire satisfaction. I can recommend it to anyone needing a spreader. It is the lightest draft spreader I ever used. I handled mine in top dressing corn with two horses and I like it fine.

S. A. WUICK, Missouri.

I purchased one of your Spreaders eight years ago and it has spread all of my manure from fifty head of stock during that time, and as a labor saver it has easily paid for itself each year. I believe that any farmer having more than five head of stock cannot afford to be without a manure spreader, unless he is especially fond of spreading manure by hand, which I am not.

C. E. HOUGH, Connecticut.



THESE letters answer every question you may have about the New Idea Spreader. We will gladly send you the writers' addresses and copies of similar letters from many others, if you want further proof. These letters, like the New Idea itself, stand every test. They prove that you yourself should have a

NEW IDEA Registered U.S. Pat. Off.

THE ORIGINAL wide spreading spreader that revolutionized old-fashioned methods—that has always been the leader. Has solid bottom with chain conveyors. Pulverizes thoroughly and spreads evenly. Drives with heavy sprockets and chain—no gears. Low down, light draft. Loads and pulls without undue strain on man or team.

When you buy insist on the "New Idea"—the machine you are sure of. If you don't know our dealer, we'll send you his name and a copy of a splendid book on soil fertility. Send your name today.

Grind Your Feed

With the Williams Patent LITTLE GIANT GRINDER

The Little Giant Grinder will grind your Ear Corn (husk, cob and all), your Oats, Wheat, or any other grain, into either a fine, medium or coarse meal as desired. It will not merely crack these grains but will grind them into a real meal. Equipped with genuine SKF ball bearings power requirements are reduced to the minimum. Four sizes give a wide range of capacity. Hundreds of farmers are using this machine, therefore, if you are anxious to save grain and reduce feeding costs investigate and install this machine. Bulletin No. 699 explains in detail.

HOGS AND THE MARKET

SANDERS SOSLAND, MISSOURI

"WHAT of my hogs?" The dairyman who raises porkers in connection with his business has many reasons for asking that question, for extraordinary conditions prevail in the market for porkers.

Dairymen who give markets the attention they deserve are interested more deeply in hog markets today than usual because of the vast supplies, the influence the government is exercising over prices and shipments, and the readjustment in the world's commerce from war to peace time activities.

While comparatively heavy receipts of hogs are usually witnessed at this season of the year, live stock markets of the United States never recorded a movement of porkers of the volume noted during October and November. However, the enormous rush of hogs from farms is not particularly surprising when one takes into consideration the many complex problems confronting the producer. Throughout 1918, the principal Missouri River markets of the West have received a larger number of hogs than in the preceding year and, as a rule, greater than the last few years. With the cessation of hostilities between the belligerents of the world, which necessarily brought about caution and uncertainty among the meat animal producers, it is only natural to expect matured hogs to be rushed to market. Furthermore, feed trade conditions in the country have a stimulating effect on the movement to market, high prices and shortage of corn, shorts, and other important commodities used in the fattening of porkers adding to the nervousness among producers.

Large Receipts at Market Centers

At any rate the enormous movement of hogs to live stock markets of the country offers sufficient proof that the feeders and breeders of porkers have fulfilled rather remarkably what the United States Department of Agriculture termed their "patriotic duty". It is remembered that at the outset of 1917, Secretary Houston of the Department of Agriculture called upon the pork producers of the country for increased supplies, and for heavier weights. This call has been met and in the face of obstacles which normally would cause a radical curtailment in production.

An idea of the largeness of the movement to market is shown by unofficial figures on receipts at the five principal markets of the West, including Chicago, Kansas City, Omaha, St. Louis, and St. Joseph. These markets have received more than 18,250,000 hogs for the first eleven months in 1918, as compared with less than 15,000,000 head the corresponding period in 1917. The arrivals of hogs during the period in November, when no restrictions had been placed on shipments to market, were practically double the movement for the corresponding time a year ago.

Luckily, officials of the Food Administration and Department of Agriculture were far-sighted enough to safeguard the industry from any violent fluctuations in prices. A minimum price of $17.50 per hundredweight, basis Chicago, was agreed upon for hogs in November and continued into December, with the minimum average price at other markets on a basis equal to the Lake City market price. There is little doubt, despite the world food situation which makes for extreme bullishness in the hog trade, that prices would have temporarily suffered a radical loss but for this guarantee. At one of the larger markets recently, more than 100,000 hogs had accumulated at one time, with packers unable to handle purchases.

Foreign Demand for Pork

Government officials, who doubtless have correct data on the world supply situation and the probable requirements from the United States, have recently displayed great concern over the future demand and supply. Department of Agriculture officials announced a short time ago that the population of hogs in the country has increased 8 per cent, according to reports by their investigators, while private estimates indicate an increase of more than 15 per cent. "On the other hand," the department pointed out, "the arrivals of hogs at seven principal markets the past three weeks have increased more than 27 per cent compared with a year ago." The market specialist of the Bureau of Markets publicly announced a short time ago that "under no circumstances will there be enough hogs to meet the foreign demand as soon as shipping can be arranged. We will export a surplus hog products which can properly be spared from this country."

Of considerable interest to hog producers of the United States is the following cable sent from Europe by Dr. Vernon Kellogg, who is abroad on official business for the Food Administration: "Larger importations of meat, particularly pork products from the United States, thus lessening the slaughter of native animals, will be the most effective means of restoring the depleted animal herds of Europe. The most recent statistics on herds of hogs in Europe show a decrease of 49 per cent in France, 12½ per cent in Italy, and 25 per cent in the United Kingdom. It is highly important that droves of porkers be restored as rapidly as possible, which can be done most effectively by broadening the exports from the United States."

As to the situation in the neutral and Teutonic countries of Europe there is no official data. It is well known, however, that the hog drove of Germany, Austria, and even the neutrals have been greatly depleted since the opening of the world war in 1914, and that these nations are looking forward to huge imports from America.

Lighter Weight Hogs

The hog marketing situation in America is and will continue to be in almost direct contrast to that prevailing a year ago. In 1917, the hogs leaving farms of the Southwest showed the highest average weight in history, due to high returns and generous yields of corn and other feeds. Similarly, the portions of the Corn Belt where large supplies of the coarse grain were produced shipped their stock to market with a greater average weight than at any other time in history. Live stock producers were fulfilling a patriotic duty as well as carrying out their own ideas that corn can be more profitably marketed "on the hoof" instead of being shipped as grain. What is the situation today? Kansas City, to which market southwestern live stock producers will ship their droves, is now receiving hogs weighing an average of 46 pounds less than at the opening of 1918. And all other important markets, with the possible exception of Sioux City, which center is surrounded by a territory sharing in the great yield of corn this year, are receiving lighter weight hogs. Thousands of immature porkers are reaching stock yards, which recently prompted action by the Price Stabilization and Control Committee at each of the

markets to classify hogs weighing s than 150 pounds as "throw-outs", minimum price on which stock is 5.50 a hundred pounds. The lighter ights mean less meat and less fat hog, and are important price sus- ning influences.

A large number of light weight ck hogs and pigs are reaching Kan- City, but indicative of the general timism among producers where ds are in more abundant supply, re is an eager demand for the so- led "stocker" pigs. Iowa, Illinois, fact all the corn belt, as well as tes east and north, are active buy- of the pig droves and at only a rrow discount under the prices pre- iling for fattened hogs. Some rthern dairymen are entering this rket. In September, 1917, outgoing ipments of hogs from Kansas City feed lots amounted to less than 00 head, while in September of the esent year more than 30,000 head re shipped out. Only an insignifi- nt number of pigs have been taken packers, so great is the country eder demand. The same situation evails at St. Joseph, Mo., which arket and Kansas City report the ly trade of importance in pigs.

After this resume, the dairyman o has hogs being prepared for mar- t surely can agree with this con- usion of an investigator of world od conditions:

"Peace will not add a single pound our stock of food, but it is add- g more than 200,000,000 new ouths to feed, either wholly or in rt. Now, and for a considerable pe- od after final peace terms are gned, food will be in greater de- and than ever before. The situation acute; it is not a problem of how ship, but of how to make it go ound."

Recent Foreign Food Prices

From information received by the S. Food Administration through annels considered reliable, it is pos- le to acquaint American producers ith recent quotations for certain odstuffs and feed abroad. The pre- iling rate of exchange has been ob- rved in expressing values in terms U. S. currency.

France

Retail prices of straw in Paris late September ranged from $25 to $50 r ton. Lucerne (alfalfa) was quot- at $58 to $76 per ton. Potato ices ranged from $2.22 to $3.00 per shel; butter from 83 cents to $1.02 pound, and poultry from 40 cents to .82 per pound. Although the fixed tail price of horseflesh was 17 cents r pound late in September, it was ld through unauthorized channels r from 41 to 50 cents per pound.

England

Wholesale milk prices in England ve been placed on a scale which pulates a price of 50 cents per gal- n between November 21 and De- mber 16. After that date and un- May 1, 1919, the price is 50 to 51 nts per gallon.

Switzerland

The fixed wholesale price for pota- es of the 1918 crop is $1.74 per shel. Purchases from the producer n be made only by the cantonal au- orities.

Germany

In September, people were paying 74 per pound for saccharine which few months before sold for about 5 per pound. About September 15, e price of butter in Berlin was .04 per pound and in Hamburg 98 nts per pound. The fixed produc- ' maximum price for potatoes dur- September was 58 cents per bush- in Brandenburg, and 52 cents in varia.

Bohemia

During September, meat in Bohemia cost from $2.05 to $2.56 per pound and flour was selling for slightly more than one dollar per pound. Plum jam which formerly cost 5 cents per pound retail sold during September for $1.23 per pound.

Spain

Retail meat prices during September were: beef, 31 to 32 cents per pound; and lamb, 33 to 34 cents per pound. The retail price of potatoes varied from $1.14 to $2.22 per bushel in different localities. By a recent price-fixing regulation it will be possible to sell "whitish" sugar for 18 to 19 cents a pound retail.

Russia

Milk has been selling in Moscow under restricted consumption for about 19½ cents per pint bottle and more lately at considerably advanced prices following the removal of restrictions.

Argentina

The Royal Commission in Argentina has purchased cereals for the allies at the following prices per bushel: wheat, $1.56; oats, 45 cents; corn, 62 cents.

Although the reports are fragmentary, they show by the wide variance in different countries how the war has interfered with normal production or distribution of food and in some cases both. The European prices for the most part clearly reflect the known shortage of foods, but in cases of regulation as, for instance, the English milk schedule, an artificial factor is introduced which must be understood if accurate conclusions are to be drawn.

The Argentine grain quotations are especially worthy of study as showing the effect on prices of geographical remoteness and lack of adequate shipping. They have made material advance as a result of peace.—U. S. Food Administration.

Views from thy hand no worthy action done.

La Crosse Happy Farmer TRACTOR

The La Crosse Tractor Means a Happy Farmer

AS you stand beside the La Crosse Tractor, every working part of it is right under your hands where you can reach it easily. Step into the driver's seat—and you are ready to do any power farming job as simply as you would run your automobile. There are no difficult adjustments to make—no out-of-the-way places to get at. From where you sit you can operate the implements as well as the tractor single-handed.

You need a tractor for the amount of work it will do **quickly.** Because of its simplicity, the La Crosse is the tractor you can depend on to do the work you want in good time and without delays. It is as simple as it is powerful.

The Simple Three Plow Tractor

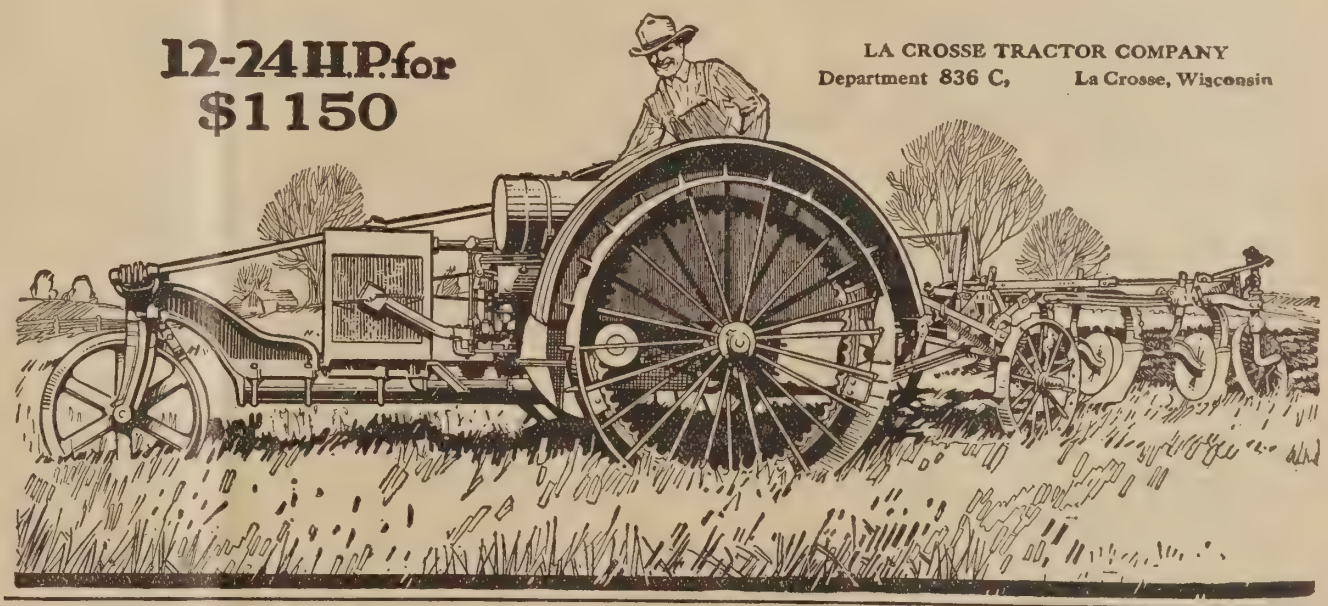
The simplicity of the La Crosse Tractor is the result of the experience and genius of the men who designed it. From the entire automobile, tractor, vehicle and farm implement field, the highest type of men have been chosen for La Crosse engineers. When you buy a La Crosse Tractor, you secure the finished product of the best brains in the tractor world.

The La Crosse is the successful three plow kerosene burning tractor. Its simple twin cylinder engine with the six inch bore and seven inch stroke delivers most power per gallon of fuel.

The La Crosse is the tractor which is easy to handle. It turns within a space of 9 feet and is self-guiding in the furrow.

La Crosse Tractor Implements

Like the La Crosse Tractor, La Crosse Implements are designed and built to do their work most economically and easily. All of them can be handled by the use of a rope from the driver's seat on the tractor.



Ask your dealer to show you La Crosse Tractor Plows—both moldboard and disk—the La Crosse special Tractor Disk Harrow and the La Crosse Automatic power-lift and power-pressure Grain Drill.

See the La Crosse Now

The La Crosse Tractor offers you 12-24 horsepower for $1150—full three plow capacity, with guaranteed drawbar pull of 2000 pounds and 24 belt horsepower. It is famous the country over as the tractor with "most power for the money".

Now is not a bit too soon to see the La Crosse dealer near you and have him place your order for Spring delivery. Write us today for his name, as well as that of the district distributor, who will make arrangements for you to see the next outdoor demonstration.

12-24 H.P. for $1150

LA CROSSE TRACTOR COMPANY

Get More Milk from Happy Cows

Cows are a lot like human beings. They cannot do their best work unless they are healthy and contented. Feed is the all-important factor, and the feed which is today giving the best results is

Happy Cow Feed

You'll appreciate Happy Cow Feed. It is the proper combination of cottonseed meal, wheat bran, velvet bean meal, corn meal, unhulled peanut oil feed, rice bran and polish, alfalfa meal and ½ of 1% salt—all high grade ingredients.

No feed manufacturer in the world is better located for making high grade feed products than this company, and to this great advantage is added the modern milling equipment and a lifetime of successful feeding experience.

Happy Cow Feed will be a revelation to you. It will quickly turn your losses into profits, because it solves the high cost of feeding. It is made with or without molasses—as you prefer.

Happy Cow Feed is in harmony with the great research work of Dr. E. V. McCollum. It is clean—palatable—digestible. It insures you the largest profits in milk production.

Eradication of Disease From the Farm

(Continued from page 773)

mitted to human beings, especially children, by infected milk.

The tuberculin test is the most reliable agent at our command for the detection of tuberculosis in animals. In the hands of competent and experienced men it is capable of picking out practically all of the tuberculous cattle in a herd even though they show no outward signs of being sick.

If a herd is known to possess tuberculous animals, the first step to be taken in eradicating the disease is to find out just which animals are tuberculous. The proportion of animals proving to be tuberculous should guide the owner in his next move. Should only a few grade cattle prove affected, there is little doubt that the best procedure will be to promptly dispose of them by slaughter, having them slaughtered and examined, if possible, at an abattoir having federal inspection.

Where the tests show that more than half of the herd is diseased, it will be safer and cheaper to consider all of the cattle diseased, and then begin to build up a new, healthy herd by raising the new-born calves. They should be taken away from the diseased animal as soon as born and fed on pasteurized milk. Only very careful attention to details will lead to success in this undertaking, because of the constant danger of infecting the healthy calves with materials brought from the tuberculous part of the herd.

New cattle should never be placed in a healthy herd until they have successfully passed a reliable tuberculin test.

Hog Cholera

Hog cholera has been found in nearly all parts of the United States, but is more prevalent in some sections than in others. The disease spreads rapidly and the yearly losses from its attacks reach millions of dollars. The infection may be carried from place to place upon the shoes or clothing of people, on the feet of horses or dogs, or upon wagon wheels and in countless other ways. It is plainly to be seen therefore that the farmer who has a healthy drove of hogs should use every effort to keep infection away from them. No one should be allowed to enter the hog lot unless it is certain that he has not previously been near hogs suffering with hog cholera. Careful attention to the isolation of the healthy herd will probably be all that is needed to keep it free from hog cholera in uninfected sections of the country. Where the disease is known to exist in the immediate vicinity, preventive inoculation with anti-hog cholera serum should be resorted to at once.

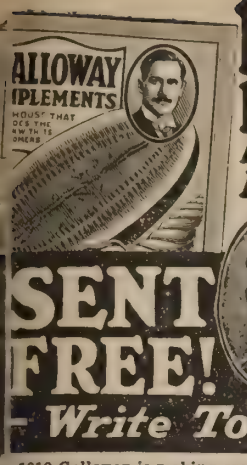
Placards announcing the presence of hog cholera upon the premises should be conspicuously posted at the gateway of every farm upon which the disease is known to exist, as a matter of protection to neighbors having healthy hogs.

Texas Fever

Texas fever, being carried by ticks from animal to animal, must be treated differently from other infectious diseases. Cattle that are native to tick infested localities may carry numerous ticks upon their bodies for many years without contracting fatal cases of fever. They are a great source of danger, however, to cattle born in sections free from ticks. Keeping tick-bearing and tick-free cattle constantly separated is therefore a very important measure in the suppression of Texas fever. The United States Department of Agriculture is working in co-operation with the people of tick-infested regions of the South to free th farming lands of those areas from a infectious cattle ticks. Thousands square miles have been freed, and th good work is progressing rapidly. A soon as the whole country has bee cleared, the extensive provisions fo keeping infested and uninfested catt separate, that are now in active forc at all stockyards and on all railway may be abolished, and an immense sa ing of money will result.

Contagious Abortion

Contagious abortion in cattle is germ disease which causes the death unborn calves and occasions annu losses of millions of dollars. The co tagion is spread at the time of bree ing or may pass from animal animal by means of contaminate feed and water. The germs are pre ent in large numbers in the abort fetus and its membranes, wherefo places fouled by an aborting co should be thoroughly cleaned and d infected. Through burning, buryin or disinfection of infective materi great progress can be made towa the control of the disease. A cow th has aborted should be removed i mediately from among the healt animals and given appropriate trea ment, which includes the irrigation uterus with suitable disinfectan After abortion, breeding should suspended until it is evident that t vaginal discharge has ceased. Abo ing cows are likely to become immu eventually, so if they are profitab animals they should not be slaug tered but should be retained in t herd.



Fowl Diseases

Fowl cholera, blackhead, and ro are infectious diseases that sometim cause serious losses in the poult yard. The killing and burning of bi that are affected with either of t above diseases, removal of those th are apparently healthy to fresh, cle quarters supplied with clean fo troughs and drinking fountains, gether with careful attention to fe ing and watering and persist cleanliness, will do much to suppr these troublesome outbreaks.

Combating Infection

The experience gained in fight against the various infectious d eases that have appeared from ti to time has been of the greatest va to the live stock sanitary officials the country, for they have been for at times to contend with the m actively infectious diseases of dom tic animals. Infection may be c veyed by means of direct contact, indirectly by infected manure, h stable utensils, and the like. Human ings in certain instances may carry infection with them on their cloth and shoes, or may transmit it fr their hands while milking or car for stock in other ways. It may a be carried by dogs, cats, rats, pige etc.

It is obvious that only the strict measures can succeed in stamping diseases that spread so quickly, that may be spread from animal animal or from farm to farm by s varied carriers. Every effort sho be made to keep healthy animals f exposure to the contagion. The cases of animals dying from the ages of an infectious disease sh be burned or buried deeply. Infe stables should be disinfected by th ough cleaning even to the removal partly decayed woodwork, since infection that will totally destroy lingering traces of the infection required for the granting of an as ance that the disease will not reapp The stable utensils should not overlooked. The manure in the y around the stables should be d fected and later spread where it soon be plowed under. Sunlight a powerful disinfecting action

open fields, yards, and the like. Special attention should therefore be given to the shaded and muddy places around the farm buildings when efforts are being made to clean up farm premises after an outbreak of infectious disease.

Farm Institutes and the College

HOARD'S DAIRYMAN:—It may be something of an experiment that New York State is about to try. Farmers' institutes have long been held there and for the most part have been handled by men closely in touch with the farms of the state. More recently some of the speakers have been from the colloge of agriculture, either as instructors or as graduates from the institution. The result of this partial change would be estimated differently by different people, but among the bureau men are nearly all, I think, college men, and are commonly expected to be present at the institutes held in their respective counties. If I look at the situation rightly the college authorities are in actual control of institutes, but an experienced institute worker, "up from the ranks", is somewhat in charge. It remains to be seen which way the institute movement will gravitate, toward the practical affairs of the farm or in the direction of those things for which it seems the college must stand. I may be criticised for this statement, but from my point of view there is a difference here, and if the latter prevails there will be no institutes in a few years. Perhaps they are not needed. I would not have the college further removed from the public, but

HOLSTEIN COW, LADY MUTUAL FRIEND

At 9 years she has produced the following records: 7-day: milk, 557.7 lbs.; fat, 24.30 lbs. 30-day: milk, 2,294 lbs.; fat 949.92 lbs.; 1-year: milk, 23,388.9 lbs.; fat, 1,025.17 lbs. The year's record is the highest yearly fat record for Iowa and tenth highest in the world.

HOLSTEIN COW, MISS PIETERTJE ALEXINA 2ND

7-day record: milk, 572.9 lbs.; fat, 24.13 lbs. 30-day record: milk, 2,256.1 lbs.; fat, 94.9 lbs. Year's record: milk, 24,219.1 lbs.; fat, 1,032.75 lbs. The year's record for fat is highest in Iowa and the eighth highest in the world.

OWNED AND DEVELOPED BY HARGROVE & ARNOLD HOLSTEIN CO., IOWA

working farmers it rather seems that institutes have not grown greatly in popularity. These same working farmers, however, have unmistakably come to a better knowledge of scientific facts, and it can hardly be doubted that a part of this is due to institute work.

The control of institutes is now in the hands of the college. At this moment the change cannot be considered popular. It is to be tested and the verdict will come later. I think the college men are acting cautiously.

This year, as in former years, a normal institute has been held, and, as has been common for some time, it is held at the college. The meeting is one of the institute speakers and farm bureau managers combined, the same as for the past few years. These I can't help thinking that the farmer shall have institutes.

The writer has always been treated courteously and generously at the college and would do anything possible to reciprocate. It is not my wish to widen any gulf. The college will do its best to make these institutes helpful. Let us of the farm do the same. We are trying an experiment. Give it honest support. If this plan is the best one, follow it. If it needs a little rearranging, let us first make sure of the fact and then do the reasonable thing about it whether the new is in accordance with our own ideas or not. I believe the college will watch progress closely and will be ready to adopt the line that means the highest good to the greatest number.

Illinois Dairymen's Association meets at Bloomington, Ill., Jan. 21-23, 1919.

Death of Dr. S. M. Ward

The live stock breeders of the United States have lost a capable and honest official in the recent death of Dr. S. M. Ward of Minnesota. Dr. Ward has rendered a signal service to the live stock interests of Minnesota, and as secretary of the United States Live Stock Sanitary Association his influence has been extended throughout our nation and Canada. He has been secretary of the Minnesota Live Stock Sanitary Board for nearly twenty years and has secured laws and provided regulations for handling animal diseases that are sane and effective.

It is largely through his efforts that the pure-bred cattle of Minnesota are practically free from tuberculosis. In his control of the outbreak of foot and mouth disease in 1914, he showed his skill in handling infectious and contagious disease.

Dr. Ward was a leader in live stock sanitation and thoroughly comprehended the principles and practices necessary to control animal diseases. He held firm convictions, but was not domineering. He fought for the right, and this made him a host of friends among the veterinarians and live stock men.

Milking Shorthorns at International

HOARD'S DAIRYMAN:—While the International Live Stock Exposition is a show mostly for breeders of beef type cattle, the 1918 gathering brought out a strong showing of milking Shorthorn cattle, this class being the dairyman's chance to take part in the beef breeder's show and demonstrate what improvements they have made during the year.

The class of cattle this year was extra good. The showing was confined to a few breeders but their herds were increased over a year ago and the class of cattle looked better. There were not many exhibitors in the class but they had over 60 animals in the ring.

Cattle in this class, except three-year-olds or over, had to be out of Record of Merit dams or sired by bulls out of Record of Merit dams, or by bulls having two or more Record of Merit daughters. Attractive prizes were offered for winners in this class. Six hundred dollars of the amount offered in prizes in this competition was contributed by the American Shorthorn Breeders' Association and $500 more by the milking Shorthorn breeders.

A. H. Tyron of New York acted as judge and placed the winners in the milking class.

The exhibitors were: McMartin & Son, Minnesota; Gretna Farms, Illinois; Carpenter & Ross, Ohio; J. E. & C. B. Wade, Ohio; R. R. Wheaton, Ontario; Peter Traynor & Son, Wisconsin.

The winners were:

Aged cows—First, McMartin on Roan Maud; second, Gretna Farms on Sprighty Millicent; third and fifth, Carpenter & Ross on Fillpail Baroness and Valentine Belle; fourth, Traynor on Clarabella.

Cows, three and under five—First, Gretna Farms on Charming Daughter; second, Wheaton on Rose Clyde; third, McMartin on Lucy 14th; fourth, Gretna Farms on Trilby; fifth, Traynor on Mae B.

Two-year-old heifers—First, McMartin on Snowdrop; second, Traynor on Sunshine; third, Wade on Snowdrop Daisy; fourth, McMartin on Irene 2nd; fifth, Wade on Thanet Princess.

Senior yearling heifer—First, Traynor on Kinsella Buttercup; second, Wade on Snowdrop Laura; third, Gretna Farms on Louise 11th; fourth, Traynor on Wisconsin Ruby; fifth, Wade on Royal Lady.

Junior yearling heifer—First, McMartin on Redbud 2d; second, Gretna Farms on Cloe's Lady Ann; third, McMartin on Snowball 2d; fourth, Gretna Farms on Gretna Lilac; fifth, Gretna Farms on Sunshine; sixth, Traynor on Wisconsin Rose.

Senior heifer calf: First and second, Gretna Farms on Gretna Pride and Kelmscot Pink 2d; third, Traynor on Kinsella Rosa; fourth and fifth, McMartin on Iris 4th and Doan Maud 6th.

Junior heifer calf—First and second, McMartin on Clementine 5th and Lucy 18th; third, fourth, fifth, and sixth, Gretna Farms on Spry Millicent, Louisa 12th, Barbrahm Cherry 3d, and Gretna Lass 3d.

Senior and grand champion cow—McMartin on Roan Maud.

Junior champion cow—McMartin on Rosebud 2d.

Illinois. JOSEPH M. CARROLL.

Boys' Short Course

HOARD'S DAIRYMAN:—The school for farm boys which has been conducted at the Marshfield, Wisconsin, Experiment Station, came to a close the middle of December. This is the first time a school of this kind has been in operation in Wood County, and judging from the interest shown by the boys in attendance the school will become a popular institution in the future. The school is an outgrowth of the vocational bill passed during the last session of Congress which makes available money to be devoted to education in agricultural work for the boys on the farm who are unable to leave for any great length of time and who need just the kind of instruction given at these short term courses.

The work of the Farm School is under the direction of Mr. Taylor, who is employed by the Federal Government. In his work at the Experiment Farm School he was assisted by men who have charge of the work at this place. The work is practical and adapted to the particular needs of the boys—stock judging, rations for dairy cows, types of animals, and care of animals, occupied most of the first week of their time. Short trips were also made examining other herds of pure-bred stock and hogs.

The second week was given over mainly to a study of the soils of this section and how best to manage them with the view of getting the best return. The study of varieties of grain and corn occupied another two-day session. In all of this work the aim is to present the subjects covered in a practical way so that it can be applied to conditions on the farms from which the boys come.

During the entire period the attendance was perfect, an index of the interest shown by this group, some of whom came five miles.

Mr. Taylor is also planning to follow up the work with the boys during the summer. Each farmer student is to take up one or more projects on his home farm, putting into practice some of the suggestions covered during the two weeks' session, just brought to a close.

Wisconsin. F. B. LAMSON.

New York Butter Market

NEW YORK CITY, DEC. 17—There has been a variation of only a half cent in quotations on butter since last week, but that does not truly indicate the different feeling that has prevailed on the several days. All variations of activity have been present during the week. One day the market was apparently very weak and on the following day a marked strength would develop. That was due to the highly nervous condition that has prevailed at all times this year. The fact that a sudden weakness might cause a marked decline in price with great losses causes every dealer in butter, whether he be wholesaler, jobber, or retailer, to take no great chances. At present it is a game of play safe and no one is accumulating stock greatly in excess of what is needed for immediate trade.

One week ago today a quotation of 69c for extras (92 score) was established. That quotation prevailed during the remainder of the week. Yesterday there was an advance of a half cent as stocks were fairly well depleted and there was a healthy demand. There was scarcely enough high quality butter to supply the demand but the arrival of some California butter that had been in transit for some time helped to supply the trade. Today there is a marked activity and the quotations as established yesterday prevail but there are indications that we may expect another small advance in the next day or two. There is still a very wide range of prices between undergrades and high quality butter, although the lower grades are selling to better advantage than during the past weeks. Receipts are fairly regular but the output at present seems to have about reached the minimum in quantity. The fact that at present no increase in production can be expected leads one to believe that no marked reduction in prices of butter will take place for some weeks, at least.

At the close today established quotations were as follows: Extras (92 score), 69½c; higher scoring than ex tras (93 score or above), 70@70½c firsts (88 to 91 score), 64@68½c and seconds (83 to 87 score), 59@ 63½c. Unsalted butter is scarce ar is quoted at a differential of 1½c ov prices of corresponding grades salted butter. W. B. LIVERANCE.

Velvet Bean in Feeding Tria

HOARD'S DAIRYMAN:—The Sou Carolina Experiment Station recent compared velvet bean meal, whe bran, molasses feed, and cocoan meal as supplementary feeds f cottonseed meal for dairy cov Twenty cows were used in the e periment, these being divided in four groups of five each. The gra ration was mixed in the proportion one part cottonseed meal to two pa by weight of the other feeds. The id was not to dispense with the use cottonseed meal, but to determi which one of the three feeds me tioned would best supplement cott seed meal as a part of the grain tion. The cows were fed on these exactly one month, and the amount milk produced was the method determining which was the best s plement to cottonseed meal.

This grain ration was fed at rate of one pound for each th pounds of milk produced. The rou age given was five pounds of hay all the silage the animals would cl up well. The velvet bean meal very unpalatable to the animals at beginning of the experiment, they apparently cared for the lasses feed considerably more t they did for the velvet bean meal. cocoanut meal seemed to be distast to the animals, as some of them w consume just as little of it as poss when mixed along with cotton meal.

Of these grains, the velvet proved to be the most econom and even though it was not reli as much as the molasses feed proved to be the best when meas in terms of economy of milk pro tion. This is about what might be pected of velvet bean meal, as it shown up to decided advantage great many experiments when along with cottonseed meal in proportion of two to one by weigh is not advisable to try to feed v beans alone, as they are not suffic ly palatable to cause the cows to them up well. And, too, it is not ficiently rich in protein to be depe on for the larger part of this stance. But used along with co seed meal these two objections largely overcome.

Experiments show that it little difference whether or not velvet beans and the pods are gr up into meal, or whether the bean in the pod is fed. One form to give just about as satisfa results as the other. Of course the beans are fed in the pod should be soaked in water for at 10 or 12 hours before feeding, to soften both the pod and the In the lower part of the South a large percentage of the dairyme now feeding a grain ration com partially of the velvet bean in form, and the results obtaine tests at experiment stations a dairymen themselves pretty gen agree that it requires from two and a half pounds of velvet bea the pod to produce as much m one pound of cottonseed meal that the most satisfactory way t it, either in the pod or ground, mix it with cottonseed meal a the grain ration be composed less than one-third of cottonseed

ring 2,000 Farmers in North- rn Minnesota a New Start

HOARD'S DAIRYMAN:—Without king a personal trip to the burned- r area in Northern Minnesota it is ossible to conceive of the devasta- wrought by the fire. Over 1,200 are miles of territory were cov- l by the fire and in this area prac- lly no buildings escaped. The fire accompanied by a sixty-mile wind ch carried the flames for a half out into clearings and even into s, leaving 2,000 farms without lter of any kind and resulting in ut 600 people being burned to th. The survivors had to have k relief and this was furnished by Red Cross and by the Northern nesota Forest Fire Relief Com- sion under the management of onel Eva, who was appointed by governor of Minnesota.

he first problem was to furnish hes and these were supplied large- rom donations sent from all parts he country. The clothes furnished uded new clothes taken from es, old uniforms of various kinds, hing of every style used in the fifty years. Even the settlers in r grief had to laugh at each other ssed in gaudy lodge attire with l buttons and fancy stripes. One he most popular articles of wear- apparel were carnival overcoats ch were supplied in abundance by people of St. Paul. These were guady colors and queer shape but important part was that they e made of warm material.

ext came the matter of supplying l to the people and this was done establishing store houses in each ne towns where supplies were fur- ed free of charge to the fire suf- rs.

ne next problem was to furnish es of some kind. In the Duluth re- the people of Duluth organized rews of five or six men and went the country with loads of lum- and actually erected small houses the farmers. In other parts of the area farmers were furnished lum- and built their own one-room es, but before this could be done had to be provided with which to l, wagons with which to draw out lumber, and in many cases har- es to take the place of those ed in the fire.

rom the standpoint of caring for people there was a great problem, little has been said about almost reat a problem and one which is nuch interest to farmers. Only t 900 head in all of the cattle and es in this 1,200 square miles of ed over country were killed by ire. Several thousand head saved lives by getting into the clear- and were left without food or er and this was the problem that taken charge of by the county ts and other agricultural men of egion. The day following the fire, h occurred on October 12th, the st Fire Relief Commission was ed and one of the first steps tak- y the Commission was to put out rder that no live stock of any should be sold without a permit the county agents. The reason his order was that many of the rs feeling that they could not ide feed would sell their live at much less than its real val- nd leave the region. The Com- on planned to provide food for tock and to help the settlers to ld their homes. This problem handled in different ways in the localities where the destruction greatest.

the Moose Lake area the first was for County Agent C. P. son and deputy to visit the herds ull out the stock which was not keeping over winter. This gave them a fine opportunity to get rid of much of the poor class of live stock which had been kept in this region, especially the scrub sires. This stock was shipped out in carload lots, the farmer receiving the highest market price for all of them. Farmers were then furnished with enough lumber to build barns which would do for the winter to house the stock which they had on hand. Warehouses were then built in each of the towns and feed provided to supply the needs during the coming winter. The greatest difficulty has been to secure enough hay, but so far all of the stations have received enough for their immediate needs.

In the Duluth region another plan was followed. On the day following the fire the county commissioners met in a special session with County Agent E. P. Gibson and decided that the best plan would be to build large barns scattered through the burned area where the settlers could take their stock to be cared for until they could be turned on pasture in the spring. In a few days twenty-five of these barns had been constructed, varying in size from 18x72 feet to 32 x110 feet. These are called concentration barns and are built in a substantial manner although they are considered temporary structures. The majority of the cattle barns are 30x85 feet. They are arranged with a feed alley down the center rows of stalls made on the Hoard stall plan. The manger is made of plank and provision is made so that cattle can be watered in this manger. A good plank floor and drop is provided. It was necessary not only to provide for cattle but to make room for horses, sheep, hogs, and even poultry at these concentration centers. County Agent Gibson planned the barns and secured carpenters to build them. He then appointed several deputies who went among the farmers and collected their stock, shipping the undesirable ones and directing the farmers to take the others to the concentration barns. The best stockmen obtainable were put in charge of these barns and given all necessary help to keep the live stock in good condition. All this work was done in a few days. The relief workers were favored with good weather but even with better weather than we usually have at this time of the year the exposure and overwork resulted in a great many cases of influenza and this hindered the work. In spite of this handicap and many others, in two weeks room was provided for all the stock.

To feed all of this stock is costing the Relief Commission about $150,000 a month and this expense will continue until grass next season. It is estimated that already the Commission has spent a half million dollars. This is more than has been provided but the Relief Commission does not stop because it has no funds. They know that the people of the state and the United States will support them in spending whatever money is necessary and they are working with this in mind. County Agents Johnson and Gibson feel that the present situation is giving them a great opportunity to improve the live stock of the burned over country. They have culled out practically all of the scrub sires which had formerly been used and now must provide something better to take the place of these culls. Here is where the live stock breeders of Minnesota have a chance to do a great piece of work and they have not overlooked the oppportunity.

Mr. S. B. Cleland, Assistant State Leader of County Agents, put this problem up to the breeders' association in the state and they at once offered to do all they could. The Minnesota State Holstein Breeders' Associa-

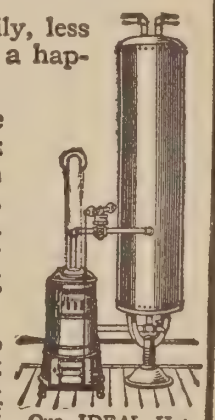
Warm and Safe for Farm Family

When the work takes you away for the day in barns or fields, or to town, the family will be safe and comfortable with IDEAL-AMERICAN heating, making the whole house as warm as June

IDEAL-AMERICAN heating is the best paying, most economical equipment you can put on your farm. It is a permanent improvement and a wise investment—never wears out, always on the job, burns any fuel you have, and gives the most heat at the least cost. Thousands of farm homes which are Ideally heated do not know the terrors of the hard winters.

AMERICAN RADIATORS & IDEAL BOILERS

You can buy an IDEAL-AMERICAN Radiator Heating Outfit for fewer bushels of grain than you could in 1916! Think it over!



It means better health for the family, less labor for you, absolute comfort, and a happier, easier life on the farm.

Not necessary to have water pressure. You get back the first cost even if you sell or lease, and you get big yearly fuel savings; so why delay on a sure, high-paying investment like this?

Call up your dealer today and ask him to give you an estimate for installing IDEAL-AMERICAN heating this week. It can be done in a few days in any kind of buildings without disturbing the family.

Our IDEAL Hot Water Supply Boilers will supply plenty of warm water for home and stock at small cost of few dollars for fuel for season. Temperature kept just right by *Sylphon* Regulator. Write for booklet.

IDEAL Boilers will supply ample heat on *one charging of coal* for 8 to 24 hours, depending on severity of weather. Every ounce of fuel is made to yield utmost results.

Send for our Free Heating Book

We want you to have a copy of "Ideal Heating." It goes into the subject very completely and tells you things you ought to know about heating your home. Puts you under no obligation to buy.

Sold by all dealers. No exclusive agents

Grow Wheat in Western Canada

One Crop Often Pays for the Land

Western Canada offers the greatest advantages to home seekers. Large profits are assured. You can buy on easy payment terms,

Fertile Land at $15 to $30 per Acre—

land similar to that which through many years has averaged from 20 to 45 bushels of wheat to the acre. Hundreds of cases are on record where in Western Canada a single crop has paid the cost of land and production. The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta want the farmer to prosper, and extend every possible encouragement and help to

Grain Growing and Stock Raising.

Though Western Canada offers land at such low figures, the high prices of grain, cattle, sheep and hogs will remain.

Loans for the purchase of stock may be had at low interest; there are good shipping facilities; best of markets; free schools; churches; splendid climate; low taxation (none on improvements).

For particulars as to location of lands for sale, maps, illustrated literature, reduced railway rates, etc., apply to Supt. of Immigration, Ottawa, Can., or

GEORGE A. HALL, 123 Second St., Milwaukee, Wis.
Canadian Government Agent.

WESTERN CANADA Farm Lands at Low Prices The Wheat Belt of America

EDITORIAL COMMENT

WE are thankful and proud for all our warm friends have said and done for Hoard's Dairyman in its years of toil and struggle for a position in the front rank; and we pledge that we will do our level best to keep our friends as helpful as they have ever been, by being as helpful to them as we know how to be.

HOLSTEINS OF IOWANA FARMS

Elsewhere in this issue we have made brief mention of the Holsteins of Iowana Farms. The system of breeding, feeding, and handling of this herd so completely coincides with our conception of the right way of developing pure-bred cattle that we take occasion to comment upon it editorially.

In the first place, Colonel French, the owner of the Iowana Farms, seeks to breed strong, vigorous, healthy animals of good conformation and of high dairy talent. The records of this herd speak for themselves, but it may be added that animals from this herd have many times won grand championships at the National Dairy Show.

Here we have, then, a herd that combines health, strength, dairy conformation, beauty of form, and splendid dairy talent, which to us is the true purpose and object of breeding dairy cattle. It should be noticed that 7-day records are not emphasized. They are recognized as having value, but the true capacity of a cow can not be measured as accurately by what she produces in a week or a month as in a year. It is not enough for a cow to produce a large yearly record, but she also should be capable of producing a strong, healthy calf. Besides demanding all this, Colonel French weeds his herd severely, and we commend him for it. He does not permit any pure-bred bull calf to leave his farm for breeding purposes unless its mother with her first calf is capable of producing at least 300 lbs. of fat in a year. He holds, and rightly too, that the breeding of dairy cattle is not simply mating animals which are registered, but it consists in mating animals which are registered, which are of good conformation, and which are capable of producing profitable flows of milk. We highly commend the practice of the Iowana Farms because it meets the ideal, and because we cannot conceive of anyone requiring a breeder to do more than is being done by the owner of this splendid herd of Holstein cows.

TEMPLE OF AGRICULTURE IN CHICAGO

W. E. Skinner, Secretary of the National Dairy Council, suggests that a monument to agriculture be erected in Chicago in the form of an agricultural temple in which there could be united the various activities of the industry of agriculture.

Chicago is situated in the heart of the greatest agricultural section in the world—the Mississippi Valley. It is this section that brought forth food abundantly and kept our allies and ourselves well supplied.

The great metropolitan press has been slow to conceive that agriculture is the fundamental industry of the nation and that it must receive justice if our country is to develop systematically.

Mr. Skinner, in an article in the Chicago Tribune, says: "A city which exists because of the bountiful agricultural region it draws its life blood from and because it regulates the financial pulse of the greatest agricultural section in the world—the Mississippi Valley—it has always seemed strange to me that Chicago has never given to the country an evidence of its appreciation of its splendid position in the world's commerce by building a monument to agriculture that would serve to centralize and help all agricultural effort through one great national headquarters where all the world could come for information on food. There are now located in Chicago all kinds of agricultural associations, each performing a service for its own special line, and with no co-ordinated effort for the good of the whole. A movement calculated to bring all these units under the recognition of this great city's business interests would do more than anything else to create that better relationship between country and city which seems now to be attracting the thought of the best business brains of America."

It is our hope that the business men of Chicago and the citizens of Illinois will see the importance of such an institution and will put forth effort to build a temple of agriculture in memory of the part the Mississippi Valley played in our great world struggle and at the same time serve a purpose to further the development of agriculture and to bring a better understanding between the city and the country.

MARKET PRICES

Several years ago, before the milk producers of this country were effectively organized, a group of farmers called upon a prominent milk dealer of a large city in Wisconsin. At that time milk was selling for $1 per hundred, and these farmers informed the dealer that they could not afford to produce milk at that price. The milk dealer being informed regarding the cost of milk production, as he had been a dairy farmer for many years, agreed with them. These men then asked that he pay $1.25 per hundred for milk. He replied that milk was worth at least $1.25 per hundred, but that he could not pay more than $1 per hundred as long as other farmers were selling to his competitors for $1 per hundred. "If I were forced to pay $1.25 per hundred," he said, "and my competitors paid $1 per hundred, inside of a few months this institution would go into bankruptcy. If you farmers can get those delivering milk to this city to sell it for $1.25 to my competitors, then I will willingly pay my patrons $1.25 per hundred, but I can not pay more than the market price for milk."

Here is a law of trade which must ever be borne in mind. The market price for a farm product may not be sufficient to pay for cost of production, but it can not be expected that one dealer will pay more for milk than other dealers in the same city when all must sell their product for the same price to the consumer. This situation shows clearly the necessity of farmers co-operating in communities for the purpose of selling their products and making a collective bargain. It does not mean that they should organize to force prices beyond what the consumer will pay. One person can lead a horse to water, but a thousand can not make him drink. Milk may be put on the market at a definite price, but no number of men can force the consumer to buy it at that price.

There are those who would have us believe that the farmers have formed a trust, but there is no such thing among farmers and we doubt whether the time will ever come when any such thing can take place. There are six million farmers in the United States, and the task would be too large to form an effective organization where they would act as a unit in the selling of a particular product. This must be done before any trust may be formed. We believe in organization, but trusts are inimical to the interests of the masses and a restraint on enterprise and competition which are vital to healthy business conditions. We are not so narrow as to believe that a farmers' trust has any more virtue than other trusts. The farmer in marketing his product, however, can co-operate and secure the market price for it. If the market will not pay what a thing is worth, a decrease in production of that particular product follows, and ultimately the price will rise to the level which will make its production profitable.

WHAT WE REALLY KNOW

Some years ago a quaint old farmer made this remark to us:

"I have lived a good many years; I have tried to be a close observer of the things about me on the farm; I have read what I could and kept all that I could understand. But this I have come to believe fully: that of all the great mass of stuff that comes to us as knowledge, the things we think we know, there's but little of it that we really do know,—that sticks to us and that we can count on day after day as being really so."

The old man was right. There is a vast accumulation of so-called knowledge taught in the schools. Most of it is a contradiction of that taught twenty-five years ago. Some of that received as the truth now will be contradicted in the same school twenty-five years from now. So it is with the experience of the farmer. The learning of the supposed truth today means the unlearning of that believed in yesterday. Everywhere and in everything where we deal with Nature are we meeting with this marvelous shifting of the scenes, this change and variability; and so at last we come to understand that the subject to be studied is vastly bigger than our capacity for studying it. With the farmer, if he is a wise man, this constant stream of variation is ac-cepted. He knows that his best judgment is no-ing more than a close guess, a little closer p-haps than his neighbor, for he refuses to be "c- sure" of anything.

We find in breeding our cattle and plants t- Nature throws us off the track of certainty by universal law of variation. We find in deal with the soil that nowhere can we be "cock su- that we are right.

But we do find that those men are nearest ri- the most successful, the closest guessers, who br- to their task the most enlightened and compreh- sive minds. To such minds Nature yields the l- est number of her secrets and with that they n- be content. Nature has no mercy for the s- willed, the narrow-minded, and the ignorantly c- ceited. They have no reverence for her and so treats them with contempt, making their pun- ment oftentimes "harder than they can bear".

PRICES OF FEED AND DAIRY PRODUCTS

The dairy industry has been passing thro- a rather trying time. There has been a shortag- labor and, until recently, the prices of dairy p- ucts have not been in keeping with the price feeds and labor. But now the industry finds i- in a more encouraging position, as the price of ter, cheese, and milk is about in the right rela- ship to the price of other things. This should b- encouragement to the men milking cows.

It is held by some, especially the city press, milk is too high in price and that butter and ch- are too expensive, and that the dairy farm profiteering. When we consider the rise in v- of feed and all things that the dairyman buys prices of dairy products are about in keeping the prices of everything else.

We have tried to determine, as far as pos- the prices of feeds 15 and 18 years ago in ord- compare them with the prices of feeds at the ent time. It should be borne in mind that it i- an easy matter to arrive at definite prices of e- feeds or dairy products as they vary in diff- sections of the country, and it depends whether the feed was purchased in the summ- wholesale lots, or from the retailer.

We find in the Elgin district, in the winte- 1901 and 1902, that the price of bran was $18 per ton, corn $20, gluten feed $22, oil $28, and hay $10. Now, the prices of the feeds are: bran $40, barley $40 to $42, corn gluten feed $60, oil meal $60, hay $20 to $2- will be observed that the prices of feeds nov- from 2 to 2¾ times higher than they were ba- the winters of 1901 and 1902.

How about the prices of dairy products? years of 1901 and 1902 the shipper of mill- Chicago received from 80 cents to $1.50 a- dred; or, in other words, 23 to 43 cents a for fat. A large co-operative creamery in I- paid its patrons at that time from 19 to 28 c- pound for fat. The Chicago milk shipper now ceiving about $1.07 per pound for butterfat, the shipper in New York is receiving about or, in other words, three times as much is paid for fat now as was paid back in the ye- 1901 and 1902 for milk produced for direc- sumption.

The good creamery will pay from 72 to 80 per pound for fat to its patrons during the of December, if the present price of butter c- ues. This means that the creamery patron ceiving about three times as much for fat as 18 years ago this winter. In other words, products have advanced a little more than ha- prices of feed and the dairyman is in a little shape now for making a profit from his her- he was 18 years ago.

These conditions should give encouragem- the man keeping cows and it should lead him from dwelling upon the experience he has securing a fair and just price for his product- ther, let us bear in mind that there is an ad- supply of grain in the world for human foo- there is a shortage of dairy products an- means, we believe, they will be relatively in price than other farm products for severa- to come. The opportunities for making mo- dairying are better now, and they will be st- ter in the future than they have been b- dairymen have made up their minds to get market price for their milk and the consume- being taught that milk is one of the cheape- mal foods on the market.

Flax Hay for Cows

flax field that was partly ripe and partly and some in blossom, was badly frosted sev- imes. This flax was cut down and stacked for Is this of any feeding value to 'just' which are in calf? Is it good for working s? This hay is to be fed alone and nothing Kindly give me information in regard to flax hich contains seed and has been frosted. gner, Mont. C. J.

above inquiry was referred to several of the rn agricultural colleges and the following re- have been received:

difficult to give advice without seeing a sam- the flax straw or hay under consideration. farmers have met with good success in feed- ich straw provided the straw was properly ted and sun-dried. A good many farmers met with severe losses from feeding imma- lax straw which has been frosted or which hreshed while containing green, improperly bolls and blossoms and which molded.

as been quite clearly demonstrated by studies s institution that flax straw frozen while , then cut as hay and improperly cured, is to develop a high percentage of cyenogen. this material is fed in any large quantities die after the same manner as those which eat frosted sorghum.

as been further demonstrated, both by prac- feeders and by chemical studies, that green raw cured as hay in sunlight without moldi- r wetness, makes good fodder and does not n sufficient of the cyenogen products to harm. Indeed, throughout this entire North- very much flax straw is fed to cattle and report fine success with it. Some stockmen that when it is cut as hay, properly cured be- horoughly mature, that they consider it in approximately equal to anyone of the le- . All, however, advise caution in feeding raw for the following reasons:

If the threshed straw is thoroughly mature bad job of threshing has been done there e an excess of seed in the chaff and straw al injury come from stock eating too much.

In such a thoroughly matured straw there to be an excess of dry fiber and if stock is this only, the fiber accumulates in the stom- uch in the manner of hair balls.

th Dakota growers who have met with suc- n feeding flax straw recommend always, in g the feed work, that it be not fed alone as correspondent indicates, but as a partial ra- ith other coarse straws and feeds. They also mend that if it is used in any large percent- the ration that the stock be given free ac- o water and plenty of salt for reasons that an easily appreciate.

H. L. BOLLEY.
th Dakota College of Agriculture.

hay will feed quite satisfactorily to cows as s horses. Stock should not be allowed to run stack, however, and should not receive more ix or eight pounds of flax hay per day. They also receive good oat straw or prairie hay lition. The flax hay should have a feeding of slightly higher than straw, and not quite h as hay.

eeding flax hay of the quality you mention is some little danger of the prussic acid poi- , which sometimes results from the feeding x hay or straw which contains considerable flax seeds. This poison, however, usually s the feeding the flax while it is green and fter it was frozen in the early fall. In win- ter it has become thoroughly dry there is not ch danger.

uld not under any condition recommend the g of the flax hay alone.

nesota Col. of Agr. W. H. PETERS.

ve fed the flax plant after it was frosted be- he seeds were mature, and with no bad re- o the cattle. I would begin feeding this flax y giving a small quantity and increasing, as n unusual and unnatural feed. This is not st request I have had for information on this

JAMES W. WILSON.
th Dakota College of Agriculture.

Starting With Alfalfa

interested in cows and alfalfa. We have a ew barn and I want to start in with 5 acres alfa. I want to start right. Want to lime oculate and get the best kind of seed. When plow, and lime, and inoculate? Shall I use e crop, and if so, what? What seed shall I use and how much for five acres? How much soil from an old alfalfa field ought I to use, and when and how applied? Would you also use cultures from agricultural college where we expect to have soil tested?

Tecumseh, Mich. MISS E. S.

Wherever practical, it is best to fall plow land that is to be seeded to alfalfa, particularly if it is sown with a nurse crop in the spring. The lime should be applied after the land has been plowed and may be applied at any time providing it is ground limestone and there is no great danger of serious washing. The inoculation should be done just preceding the seeding of the crop, care being exercised that the inoculating material is not exposed to the sun and is immediately harrowed into the soil.

The question as to the desirability of the use of a nurse crop is one that will provoke a discussion wherever the question is brought up. However, general opinion seems to indicate that it is the most economical, if not the best method. In other words, it seems scarcely practical to allow a field to lie idle for an entire year in order to secure a crop of alfalfa. Success usually follows spring seeding, and so far as our experience goes as large success will be had as with summer seeding.

We use from three to four pecks of barley as a nurse crop and from eighteen to twenty pounds of alfalfa seed per acre. This accords with the general and usual practice. If oats are used as a nurse crop, care must be exercised that they are cut early enough so as to give the young alfalfa plants an opportunity to recuperate and harden up before the extreme hot, dry weather comes on. Also, if the nurse crop starts to lodge, it is desirable to cut it for hay. In fact, several growers of alfalfa follow the practice of cutting their nurse crop for hay rather than allowing it to mature grain.

For properly inoculating one acre of ground, it will require about one ton of dirt from the surface eight inches of a field where sweet clover or alfalfa has made a good growth. To make certain that the soil contains the proper inoculating bacteria, it would be well to dig up a few roots to see if the characteristic nodules are present. After the dirt has been secured, care should be exercised that it is not exposed to the sun and that the dirt is applied in the evening or early morning or else on a cloudy day. As soon as the material has been applied, it should be harrowed in. Where the dirt has been used, it is not necessary to use the culture with the seed, although this will do no harm and may make assurance doubly sure.

Feeding Cows, Bull, and Calves

I would like to have you give me a balanced ration for my milch cows of the following feeds: Alfalfa, No. 1 (meal), per cwt., $2; bran, $1.65; corn, per bu., $1.75; oats, $.85; cottonseed meal, per cwt., $3.50; linseed meal, $3.75; I will feed alfalfa hay for roughage.

Would also like for you to tell me a balanced ration for a two-year-old, fine blooded Holstein bull, also tell me what to feed an extra fine full blooded yearling heifer.

Norwich, Kans. E. J.

Since alfalfa hay is a splendid feed for dairy cows and they will do very well if fed no other feed, we would suggest that very liberal use be made of it. We would feed each animal about all she would care to consume daily. Corn is a natural supplement to alfalfa. Therefore we would use corn very liberally.

A very good mixture to supplement the alfalfa hay would be 300 lbs. corn and 100 lbs. bran. To cows giving more than 18 lbs. of milk daily, we would feed about 1 lb. of this mixture for each 4 to 4½ lbs. of milk produced. To cows giving 18 lbs. or less per day, we would not advise feeding any grain unless they are thin in flesh and it is desirable to put them in better physical condition. To heavy milking cows, it may be desirable to feed about one-half to one pound of linseed meal per day. Linseed meal is not necessary for the protein it will furnish, but it will help to keep the animal's digestion in good condition.

We would suggest a liberal allowance of alfalfa hay for the bull, and if that will keep him in good physical condition, we would not feed any grain, but if it seems advisable to use some grain, a mixture of bran and oats, equal parts by weight, is very good for supplementing the alfalfa hay. In cold weather, perhaps a pound or two of ground corn would be in order, and if the animal does not show the thrift desired, a little oil meal, say, one-half to one pound daily, is very good.

We would give the calves opportunity to eat all the alfalfa hay they would care to consume without waste. If they are not accustomed to it, then we would begin by giving them very little. If a calf consumes too much alfalfa when it is not accustomed to it, scours follow. To calves from 6 weeks to 6 months old, a mixture, equal parts by weight, of bran, shelled corn, and whole oats would be good for supplementing the alfalfa hay and calf meal.

Choice of a Breed

will shortly complete a modern dairy barn at this place for 60 head in stanchions with additional box stalls for approximately 20, finding a market for milk or cream or both in Philadelphia. However, I have not reached a decision as to the breed I shall select, as it is important that it shall be one that will return the most ultimately from sale of product and stock. It is my purpose to start in a conservative way to build up a herd of pure-breds, possibly, if considered good judgment, to begin with heifers or bred heifers whose forebears carried with them records of repute. I would greatly appreciate your advice. This inquiry is addressed to you by a manufacturer, wholly unversed with cows of any breed. Being such, the reputation of the Holstein as a producer appeals, but as this is a strong Guernsey community, the latter seems a better investment from a breeding point.

Philadelphia, Pa. W. T. T.

Where milk is sold for direct consumption, Holstein cattle, thus far, have proven the most profitable. There are, of course, many men using other breeds for this purpose but unless one can secure a special market that will pay higher prices for the larger butterfat content, then the extra cost of producing this milk will not be returned. For the production of other dairy products, the breeds are comparatively equal in efficiency—the higher testing animals producing butterfat at the lowest cost per pound.

The choice of a breed for economical production is not so important as a choice within the breed; that is, there will be found greater variation in productive capacity between individuals within the breed than between the breeds themselves. One of the first considerations is to choose that breed which will most nearly meet the individual's personal preference and on which he can lavish the greatest affection, with the resulting care and attention to small details which, in the end, produce the best results.

There is, of course, another factor concerned where pure-bred cattle are being raised for sale. In this case, some consideration should be given, as suggested, to the prevailing breed in the section in which located. This is important, but in the writer's opinion is somewhat exaggerated where one is operating in a well developed dairy community. Ordinarily, there will be found enough individuals of the breed in such communities so that it will be an attractive place for buyers to come. However, this is a consideration that must be taken into account, particularly by the breeder who is just starting in and has not attained a reputation which, in and of itself, will draw buyers to his particular farm. It is, perhaps, of greater importance to the man raising grade stuff than to the one who is producing pure-breds of high quality.

For Cows that Freshen Next Spring

Please give me a balanced ration for my Holstein cows. We have corn silage, clover, timothy, and oats and oat straw. Which would be the cheapest ration where we have to buy the rest? We have only two cows milking now and five heifers which will be coming in towards spring. Is the same feed practical for both cows and heifers. The cows do not give much milk now. They are all quite thin as they have not had any feed this summer, only pasture.

Please give us the analysis for barley.

Iola, Wis. R. C. F.

We would feed corn silage and clover and timothy hay liberally, but would not feed very much, if any, of the oat straw unless there was not sufficient clover and timothy hay to carry the herd through until grass next spring. We would let each cow have 30 lbs. of corn silage daily and all the clover and timothy hay she will consume without waste.

A mixture consisting of 400 lbs. ground barley, 400 lbs. ground oats, and 100 lbs. oil meal will supplement the roughage nicely. Feed about 1 pound of this mixture for each 3½ lbs. of milk produced. It may be said that bran can be used in the place of oats, and corn in the place of barley, and cottonseed meal for oil meal. The suggested ration would be suitable both for the mature cows and the heifers. Cows that are fresh next spring will not need as much grain unless they are thin in flesh, then it is desirable to feed grain liberally as we believe in having a cow in good physical condition when she freshens.

In 100 lbs. of barley there are 8.4 lbs. of protein, 65.3 lbs. of carbohydrates, and 1.6 lbs. of fat, all digestible.

Sophie's Agnes--World's Champion Jersey

Granddaughter of Sophie 19th is First Jersey to Make More Than 1000 Pounds of Fat

SOPHIE'S Agnes, a six-year-old Jersey, owned by Ayredale Farms, Maine, has just surpassed the coveted mark of one thousand pounds of fat in a year. She is the first Jersey cow to reach this mark, and she surpassed it by about the same fraction that her grandam, Sophie 19th of Hood Farm, fell short of it.

Besides being a remarkable record of itself, it shows that champions can be bred from champions, and that great cows are not necessarily freaks of nature. Sophie's Agnes is a line bred Sophie Tormentor, and there is greatness on both sides of her family tree. She was bred by Hood Farm, Massachusetts, and was sold at public sale to her present owners for the record price of $10,099. She is thus the record-holder in two ways, and has justified the high price that was paid for her. She was left at Hood Farm to finish her record, and she will now carry her laurels to her new home.

Figures speak louder than words in the praise of this great line of breeding, and the qualities of heavy production, persistency, and prepotency, or "breeding on", furnish an example that cannot be duplicated in the records of any herd or any breed.

Sophie's Agnes has made the greatest Jersey record for one year. Her sire, Pogis 99th of Hood Farm, has the greatest bunch of high-producing daughters that any bull can claim, and his dam, Sophie 19th, the grandam of Sophie's Agnes, is the champion cow of all breeds, all ages, for "long distance" production.

Beginning with Sophie's Agnes, it is possible to present here the most educational and inspirational array of figures that the pages of dairy history contain. It is largely because of the far-sighted policy, its persistent pursuit, and the breeding ability displayed at Hood Farm that any such figures can be compiled. Mr. C. I. Hood, whose fame as a breeder of Jerseys extends back over many years, has consistently tested his herd for production ever since 1904, when some of his cows helped to make up the St. Louis Exposition Jersey Herd, which defeated all competition in the economic production of butterfat. It is his enterprise that is back of the records presented here:

Class AA—Carried calf 166 days during 1916-1917 test.

Her Feed

J. E. Dodge, manager of Hood Farm, gives the feed record for Sophie's Agnes. This is information seldom given because of the enormous appetite that record cows have. In Agnes' case the feed can be computed and its cost deducted from the value of her product, and a substantial profit shown. During her test she consumed various grains as follows: Wheat bran, 1,095 lbs.; corn meal, 1,095 lbs.; gluten feed, 1,825 lbs.; ground oats, 1,460 lbs.; Schumacher feed, 70 lbs.; total, 6,205 lbs.

Valuing the feed at an average of $60 per ton, her grain feed cost is $186. She had, besides, alfalfa hay, clover hay, and beets. The value of 1,000 lbs. butterfat at $.50 per pound is $500. Sophie's Agnes, it can be safely said, made a substantial profit over her feed cost during the period of her test.

SOPHIE'S AGNES, FIRST JERSEY TO PRODUCE 1,000 LBS. FAT IN A YEAR
She is a daughter of Pogis 99th of Hood Farm, sire of 35 R. of M. daughters and a granddaughter of Sophie 19th of Hood Farm—world's champion long distance cow.
OWNED BY AYREDALE FARMS, MAINE

SOPHIE 19TH OF HOOD FARM, CHAMPION COW OF ALL BREEDS FOR LONG DISTANCE PRODUCTIONS
Total production for seven official yearly tests: 91,869 lbs. milk containing 5,280 lbs. fat. She is the dam of Pogis 99th of Hood Farm and the grandam of Sophie's Agnes.
OWNED BY HOOD FARM, MASSACHUSETTS

Her Sire, Pogis 99th

Pogis 99th of Hood Farm is not only the most highly productive sire of the Jersey breed, but of all breeds. He has just qualified for an A. J. C. C. gold medal, and at nine years of age has 35 daughters in the Register of Merit with a total of 49 yearly records. The records of his six best daughters (none over 6 years of age) are given here:

	Milk lbs.	Fat lbs.	Age yrs.	Age mos.
Sophie's Agnes 296759	16,212.0	1000.07	6	1
	14,149.7	834.88	4	9
	10,171.4	619.89	3	3
Sophie's Adora 299594	15,852.2	888.00	4	0
	10,271.6	587.80	2	1

	7,242.3	463.06	2	2
Sophie's Jewel 275109	11,982.7	703.18	5	1
	9,019.3	511.34	3	10
	8,874.4	533.42	2	7
Averages	12,002.5	645.49	3	7

Sophie 19th, Dam of Pogis 99th

Sophie 19th of Hood Farm, dam of Pogis 99th and grandam of Sophie's Agnes, is herself a descendant of great individuals. Evidence that this great line of blood is "breeding on" can be readily obtained by a comparison of records and ages. The progression indicates that the end is not yet in sight. Sophie has done more than transmit equal qualities through her son. Many of her granddaughters have made better records than Sophie did at the same age. Sophie's authenticated records, which make her "long distance" champion are:

Milk, Lbs.	Fat, Lbs.	Age, Years
7,050.2	395.9	2
9,924.8	570.8	3
14,373.2	854.4	4
15,099.4	931.9	6
17,557.8	999.1	7
11,915.4	680.5	9
15,948.2	847.8	11

The cattle breeding and dairy world is indebted to Mr. C. I. Hood for his untiring efforts in behalf of greater efficiency in dairy production. His zealous support of the Jersey cow and his success in breeding have been rewarded by many high honors, not the least of which is the development of the first 1,000-lb. butterfat producing Jersey.—AMERICAN JERSEY CATTLE CLUB.

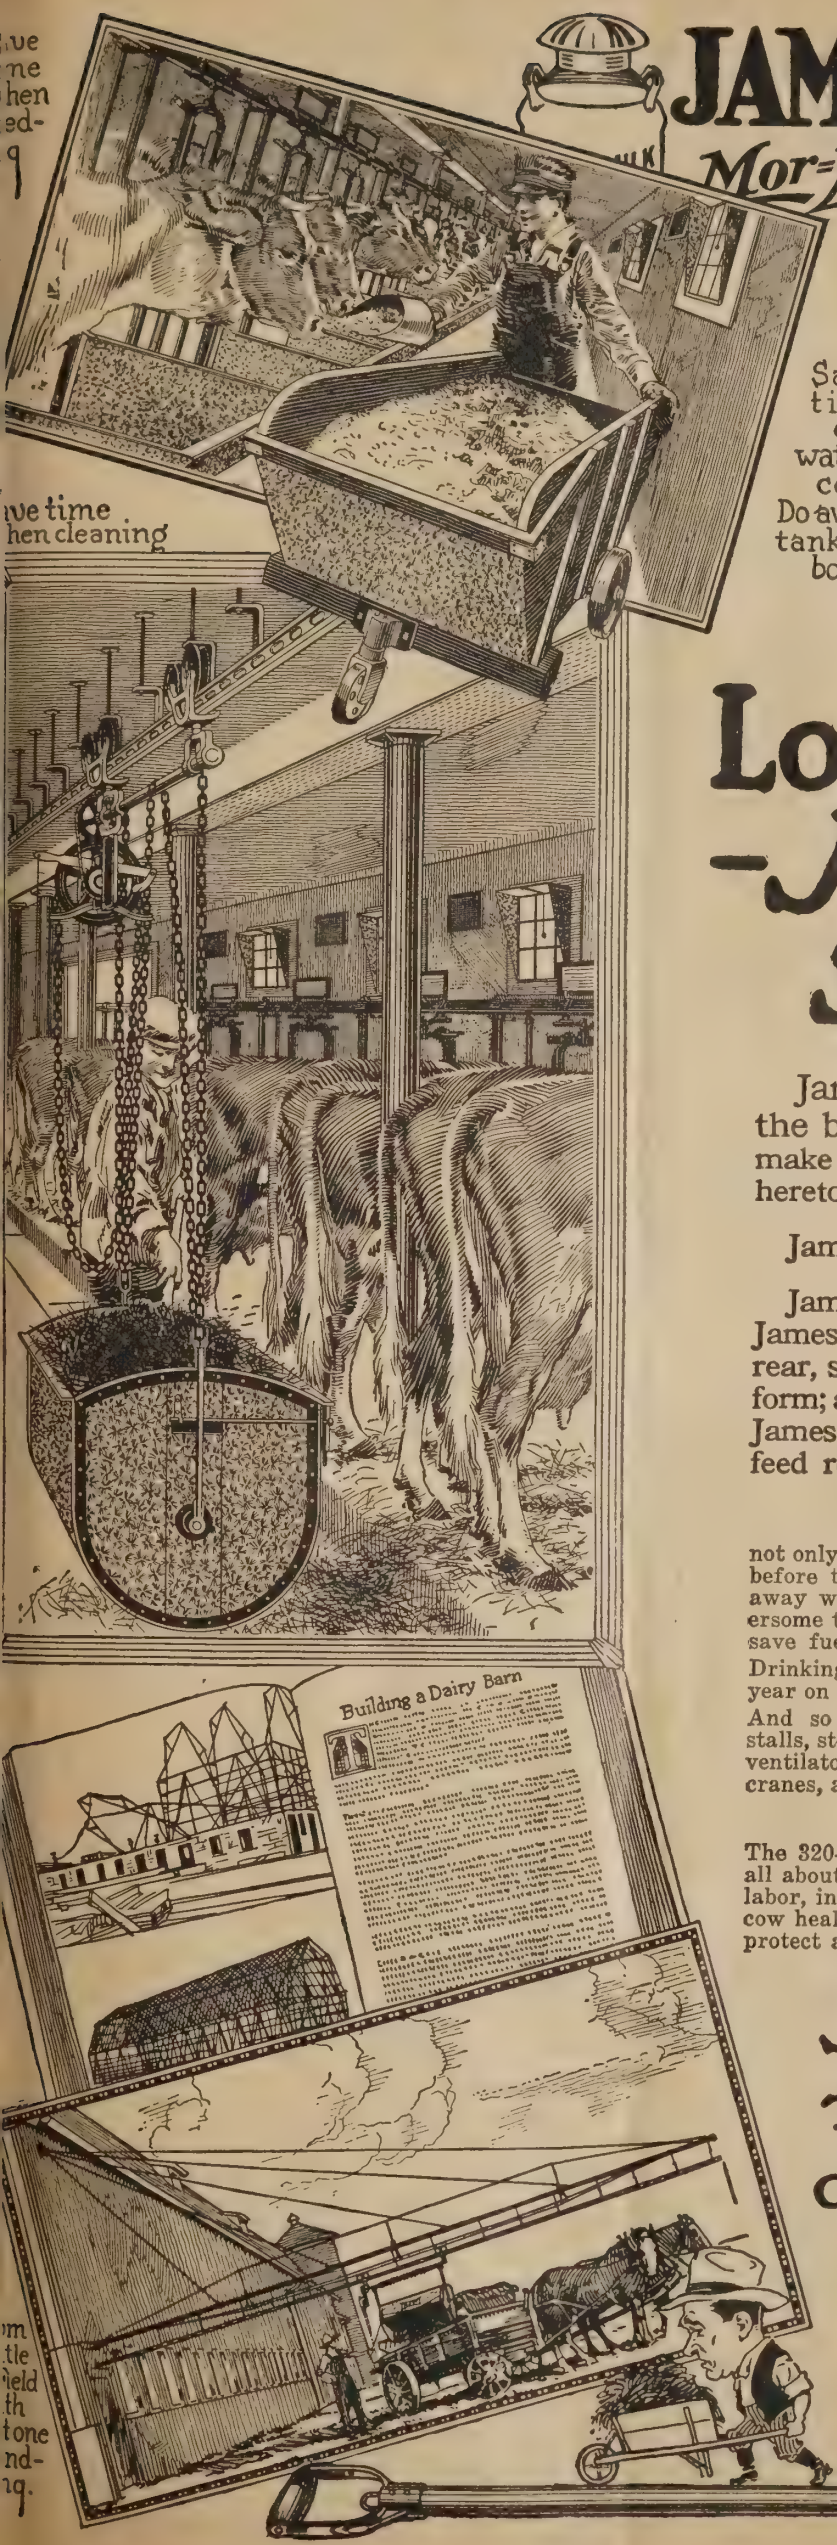
The County Agent

The county agent's position is essentially one of leadership. This means that among his qualifications should be maturity of judgment, sympathetic understanding of the farmer's problem, a genuine love for the farm and country life, an understanding of the right way to win the farmer's confidence and respect, ability to explain a technical subject in plain, clear language, experience in farming (preferably after leaving college), good health and willingness to work hard, and a broad knowledge of the general underlying science relating to agriculture. He is expected to be able to:

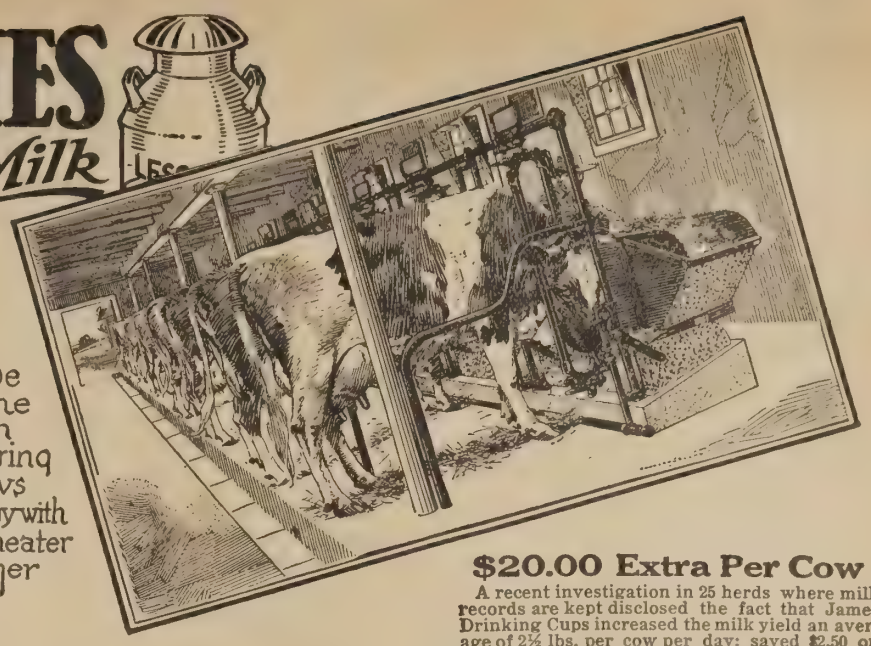
Demonstrate established agricultural facts that are of value to the community but not generally practiced.

Make available to the people of the county the results of agricultural experiments and assist in determining the application of these principles to local conditions.

Search for the best there is in the farm practice of good farmers in the county and give the widest possible publicity to their work.



Study farming in all its relations and assist in the establishment of a system of farm management that is most profitable and consistent with permanent agriculture.



Be interested in and render such assistance as is consistent with the prescribed duties to all work undertaken in the county for the improvement of farming or the advancement of rural life.

Develop and inspire local leadership and inculcate high community ideals, stimulate co-operation, and help the rural people in their organized capacity through the farm bureau and all other local associations, to make farming an attractive business and country life satisfying to man, woman, and child.

As a teacher he teaches by demonstrations rather than by books, by object lessons rather than by lecture. Not only does he see that his demonstrations demonstrate, but he capitalizes all the teaching forces in the county in giving the results of the tests or demonstrations the widest possible publicity. In carrying out a demonstration he works with individuals, but the benefit to the individual worked with is incidental. The real purpose is to reach the community through his demonstrations and so benefit all.

The county agent is essentially a field man. He spends more than three-fourths of his time in the open country with the farmers, in their fields, barns, and homes. He should have, as many of them do have, an automobile to expedite his travel, an office in the county's central city, and a clerk to relieve him from office detail. The county agent's salary averages a little more than $2,000 a year and his expenses average $1,000. He is paid partly by the federal government and partly by the state and local government.—U. S. DEPARTMENT OF AGRICULTURE.

$20.00 Extra Per Cow

A recent investigation in 25 herds where milk records are kept disclosed the fact that James Drinking Cups increased the milk yield an average of 2½ lbs. per cow per day; saved $2.50 on labor and 49c on fuel per cow each winter.

Lost a Hired Man?
—James Equipment— Saves Barn Work

James MOR-MILK labor saving Barn Equipment makes the barn work easy. The light running James Carriers make chore time almost playtime, turning the disagreeable task that heretofore has been shirked by all the help, into a job that boys enjoy.

James Carriers pay a profit of 25 per cent or more a year.

James Scrapers make quick work of cleaning up cement floors; the James Stanchions keep the stalls clean, by lining up the cows at the rear, so that manure falls in the gutter and not on the standing platform; and the James Swinging Sure-stop saves time and trouble. The James Feed Truck or Feed Carrier saves much walking to and from feed rooms,—makes unnecessary the lifting of heavy baskets of feed.

James Drinking Cups

not only save time—cows have fresh water before them day and night—but they do away with the nuisance of tending bothersome tank heaters in blizzardy weather; save fuel expense; and make more milk.

Drinking cups earn 200% and more a year on their cost.

And so with other James Equipment—stalls, steel pens for cows, calves and bulls, ventilators, bull staffs, mangers, swinging cranes, and milk can carriers.

Free Book

The 320-page book "The Jamesway" tells all about these James inventions that save labor, increase milk yields, promote better cow health and prevent spread of disease, protect against dangerous bulls and make simpler the care of calves and sick cows. It explains the easy way of putting up carriers, erecting the stalls and pens, and attaching drinking cups. Skilled help is not required.

Barn Plan Service

It tells about the James barn plan service; the James barn experts who know what has been successful and what has not; what not to do as well as what to do in planning convenient, money saving barns. Their advice on barn planning, ventilation and other barn problems is free. No charge for floor plans.

Let James Equipment solve your labor problem. Send for the book—mail the coupon now—get full details how to cut barn work in half and make more milk.

SAMSON (Model M)
Complete with power take-off and automatic control
$650.00 f. o. b. Janesville, Wis

SAMSON TRACTOR $650

THE twelve points of Samson (Model M) Tractor given on the opposite page, you will find, unlike the usual mechanical specifications, to be important features—each feature so vital as to make each one indispensable and of the utmost value.

Study each one carefully. Appreciate how the method of construction insures economy of operation, easy handling, and minimum care in maintenance.

And then think what it would mean to you to own a Samson (Model M) Tractor.

SAMSON TRACTOR COMPANY

Twelve Important Points— and Each Point a Feature

☐ ***Motor:*** The motor is suspended at three points. Extra water space surrounds the cylinder jackets. **An air washer cleans the motor of dirt, grit, and any other substance.** In this way the efficiency of the motor is greatly increased.

☐ ***Radiator:*** The radiator is of tubular type. **Extra large hand hole** makes possible easy cleaning and any repairing caused by accident.

☐ ***Oiling:*** **Forced feed oiling to all bearings.** This method of oiling will be found in the highest-priced motors built. **Forced** feed costs more than **splash** feed but is surer and safer. Our underpan construction insures constant oil level—up hill or down.

☐ ***Fuel:*** **Burns kerosene or gasoline without any change or adjustment.** Fuel tank holds 22 gallons; with extra large hand hole, enabling one to clean the tank easily. Reserve gasoline tank holding three gallons.

☐ ***All Moving Parts Enclosed:*** **All moving parts enclosed and self-oiling. All moving parts waterproof and dustproof. No moving parts exposed except the four wheels.**

☐ ***Power Take-Off:*** A feature of the design of the Samson (Model M) is the "power take-off pulley" acting **as a brake when in field use.** This brake, actuated by the clutch pedal makes change of gears safe and easy to handle. Recognized for years as standard practice in high priced motor car construction.

☐ ***Clutch:*** A plate clutch is used, which is **self-adjusting** and **runs in oil.**

☐ ***Grease Cups:*** **There are but three grease cups on the entire tractor.** (On most tractors there are too many to count.) **All three grease cups are in plain view.** One is on the fan and two on the front axle.

☐ ***Lubrication:*** **Lubricating oil is applied only at two points, and from there distributed to all moving parts**—and only two kinds of oil are used. The motor and clutch require the regular cylinder oil and the transmission and axle require a heavy transmission oil.

☐ ***Governor:*** Motor speed is regulated by a mechanical governor.

☐ ***Simplicity of Construction:*** The simplicity of construction will be best understood when it is learned that it requires only **three box wrenches to take down and put together the Samson (Model M) Tractor.**

☐ ***Tool Kit:*** The entire contents of the tool kit consists of **three box wrenches.** How many do you find as necessary equipment on the ordinary tractor? **The Samson (Model M) Tractor does not even require an oil can.**

Giving 2,000 Farmers in Northern Minnesota a New Start

[Continued from page 781]

tion through its president, E. T. Winship, offered to loan all of the registered Holstein sires needed for two years providing the Relief Commission would pay the expense of getting the sires to the settlers and would insure them. The Relief Commission considered this a very fair proposition and this plan will undoubtedly be followed. All of the sires will be inspected by W. A. McKerrow, representing the Minnesota Live Stock Extension Department, and will be of good conformation and from tested dams. The county agents in this part of the state feel that before the two years have expired they will be able to raise the necessary funds to keep these good sires in the localities in which they are placed but if this can not be done they will be returned to the original owners. The Guernsey breeders have not had a meeting since the fire but they have promised the Commission that they will make this same proposition and will furnish all the Guernsey sires needed on the same terms. Undoubtedly the other breed associations will make the same offer. This will make it possible for the settlers to have the use of good sires at no expense except their keep. When the cattle are taken from the concentration barns and returned to the owners in the spring, the county agents will lay out breeding blocks containing from four to six farmers and will see to the placing of sires. The county agents have agreed to be personally responsible for the care given the sires under this plan and in case the farmer in charge should not be giving the sire proper care the county agent will make the necessary change.

The fire, undoubtedly, will result in the long run in better conditions in this region. Much of the land that is burnt over will be put into pasture, the seed for which must all be furnished by the Relief Commission and the land will be much easier cleared than it was before the fire. In other places there are large areas of peat which were burned over and these will be in much better condition than they were before the fire. Considering this and the fact that the scrub stock will gradually be replaced by high grades, the person who visits this region five years from now will find it entirely different and a much more prosperous community than it was before the fire.

Minnesota. H. R. LEONARD.

New Zealand Dairy Herd

HOARD'S DAIRYMAN:—The latest available official figures with reference to the dairy cattle of New Zealand put the number at approximately 770,000. Considering the importance of the industry to the Dominion, the growth of the herds is relatively slow, especially in view of the kindly character of the climate, especially in the North Island, and the lucrative character of the returns. The augmentation of the dairy herds is under ten thousand a year. Land values, however, in favorable districts with near approach to rail or steamer service, are very high: £80 to £90 per acre in such localities are not considered to be excessive. There are higher prices paid than these, however, but they may be taken as representative of the desirable farms. Labor is generally scarce.

With the varying climatic conditions existing in New Zealand it has been found, putting aside farmers' fancies and prejudices, that the perfect cow has yet to be bred. But it may be said in a general way that the milking Shorthorns are most widely popular. Very great interest is being taken in the Holstein and the foundation of the stud animals, at present in service in New Zealand, was laid first by the late Mr. John Grigg of Longbeach, who many years ago imported this stock from Holland. In later years importations have been made from Wisconsin, U. S. A. For instance, Westmere Princess Pietertje's record for a 365-day test was 939.78 pounds of butterfat from 24,199 pounds of milk and she was of Longbeach blood on her mother's side, her sire being bred from strains imported from the United States. Mr. W. M. Singleton, assistant director of agriculture, professes to "know of no cow outside the United States of America which has equalled this butterfat record". He made this statement officially in July last.

The government is offering every facility to farmers to have their herds tested and the most scrupulous care is exercised in seeing that those tests are thoroughly trustworthy. It is recognized that the selection of the best strain is of most vital importance to the prosperity of this essentially farming country. The dairy farmers considered as a whole cordially cooperate with the government in its efforts to increase production and secure greater efficiency by the weeding out of unprofitable stock. Most of the dairy farmers are fairly well to do, but a great number of them are struggling men who can ill afford to carry "free passengers" on their farms.

Omitting names, the following specimen official tests may be of interest to readers:

Age at start of test Years	Days	Length of test, days	Milk Lbs.	Fat Lbs.
		Holstein-Friesian		
4		365	20,016.70	679.86

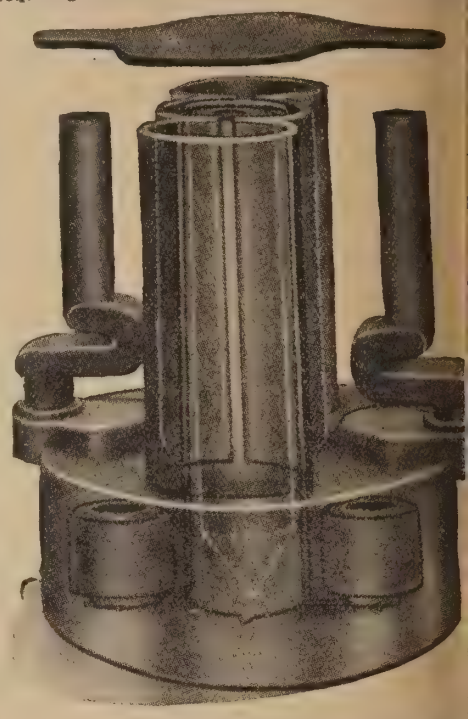
Minnesota Meetings Postponed



The Minnesota Live Stock Breeders' Association and all affiliated associations have decided to postpone their annual meetings which were to be held January first, second, and third. This action was taken after the faculty of the Agricultural College decided that it was not advisable to hold the Farmers' and Home-makers' Week at University Farm on account of the danger of spreading influenza at these gatherings.

The following associations have decided to postpone their sessions:—Minnesota Live Stock Breeders' Association; Minnesota Swine, Sheep, Horse, Ayrshire, Jersey, Guernsey, Holstein, Red Polled, Shorthorn, Hereford, and Aberdeen Angus Breeders' Associations.

W. A. MCKERROW, Secretary.

"The Clover Leaf"
Blue Flame Kerosene Tank Heate
FOR USE IN STOCK TANKS

Burns 20 hours on one gallon kerosene, requiring little or no attention. No Ashes—No Smoke.

The Body is a One-Piece Casting, eliminating all danger of leakage, and is Self Sinking, weighing 280 lbs.

The Casting is designed to give a large radiating surface. The burners are simple but dependable, giving a perfect blue flame. Two burners are ample for heat in severe weather, and one burner in mild weather. One burner can be shut off if desired. Each burner can be controlled by valve operated from the top. Does not have to be generated. Oil feed is automatic. The oil level in the reservoir basin always remains the same, requiring almost no attention.

The following letters are only a few of the many users of the Clover Leaf:

GENTLEMEN:
I have a Clover Leaf tank heater and have given it a fair trial. I am most satisfied with the result. I have a tank 5 ft. x 16 x 3, and the water never freezes. ROBERT HUDACHEK.

GENTLEMEN:
Your Clover Leaf tank heater is the best I have ever used, for good results and economy, and it is easy to operate.
E. B. CLARKE.

GENTLEMEN:
Your tank heater is O. K. Has made me money on my milk cows.
JOHN BAYNES.

GENTLEMEN:
I like your oil heater, which I have used two winters. I only use one burner unless the weather is very cold.
F. O. PIERCE.

GENTLEMEN:
In regard to your Clover Leaf tank heater, will say it does the business and is a fuel saver. RUD SCHIELE.

Satisfaction Guaranteed We want you on our list of satisfied users of The Clover Leaf T Heater. If your dealer can't supply you, send us his name address and we will send you full particulars.

Cedar Rapids Foundry & Machine Co., Mfgrs., Cedar Rapids, Iov

WASHINGTON NEEDS
DAIRY, POULTRY AND STOCK FARMERS

Washington the State of Opportunity invites you. Conditions right for dairying, poultry and live stock. Ideal climate, cheap lands, abundant water, expanding modern cities, excellent markets with land and water transportation and good roads. For free book with complete details write **I. M. Howell, Secretary of State, Dept. G, Olympia, Washington.**

CANADIAN RANCH FOR SALE

One of the finest wheat and stock ranches in Alberta for sale. Contains 800 acres—250 in cultivation. Elaborately improved; good water. If you want a farm and home that will pay for itself in one year, see this. Priced for quick sale at $35 per acre. Terms—for photos and all information, write owner,
BOX 13, - BIG VALLEY, ALTA.

Imp. Golden Secrets Grandson
GOLD MEDAL FOR SALE

3-year-old May Rose Guernsey Bull; docile; excellent breeding powers and well built individual. Dams record as two-year-old 350 lbs. butterfat.
JORDAN FARMS, SANQUOIT, NEW YORK.

Dairy and Milk Inspectors' Meeting

ARD'S DAIRYMAN:—The seventh al convention of the Internationssociation of Dairy and Milk Inors was held in Chicago, Decemth, 10th, and 11th.

. John B. Newman, Superintend- Division of Foods and Drugs of Illinois Department of Agricul- welcomed the association to Chi- and briefly spoke of the many al resources and advantages to und in Illinois, and described the ess which the state is making in mprovement of milk supplies.

. Alfred W. Lombard, president e association, responded to the ss of welcome, expressed the astion's appreciation, and briefly ed the work of the convention.

odern Developments in Dairy Milk Inspection" was the subject paper by Mr. Ernest Kelly, in e of Market Milk Investigations, Department of Agriculture. Mr. told of the progress which is made along sanitary lines by oducers and handlers of dairy cts, and presented an optimistic re of future developments along lines.

. Hoyes Lloyd, chemist in charge Milk Control, Department of h of Toronto, reported for the nittee on the Cost of Dairy and Inspection. From his report it learned that the cost of a dairy milk inspection varies from about o five cents per person per year g those cities reporting, the av- cost of dairy and milk inspecper person being between three four cents yearly. This report discussed by the members who ed to feel that the results of and milk inspection seemed to than justify the extremely cost. They also expressed an on that far better results could would be obtained as soon as pubntiment becomes sufficiently deed to demand better protection.

. C. L. Roadhouse, Professor of Industry, University of Calia, reported for the Committee ovine Diseases and their Relation e Milk Supply and the Public h, and James A. Gamble, Pror of Dairy Husbandry, Maryland Agricultural College, reported he Committee on Dairy Farm ction.

he Methods of Detecting Tuberis in Cattle" was the subject of refully prepared paper by Dr. J. Lintner, of the U. S. Bureau imal Industry, in charge of Tulosis Eradication in the state of is.

e report of the Committee on and Regulations Necessary for ing a Clean and Safe Milk Supas read by Ernest Kelly, chairof the committee. The original t presented to the association year ago, and which has since adopted by several other associawas again indorsed, and the on expressed that the pasteuria of milk be made a requirement r than a recommendation.

fessor James O. Jordan, Inspecf Milk for Boston, Mass., red for the Committee on Legisla- Affecting Milk and Milk cts.

Wm. H. Price, of the U. S. Pubealth Service, told of the work the Service has performed in evelopment of milk supplies and uarding them for the use of sol- in the army camps throughout outh.

W. A. Evans, Health Editor of hicago Tribune, spoke of the re- of quantity and quality of milk ant morbidity and mortality.

e market milk situation in Iowa was described by Dr. O. P. Thompson, State Dairy Inspector, Waterloo.

Mr. Russell Smith, Milk Specialist, U. S. Department of Agriculture, presented a paper on "Observations on the Pasteurization and the Subsequent Handling of Milk in City Milk Plants."

Mr. Geo. B. Taylor, also of the same division, presented a paper "A Report on Questionnaire to Health Officers Concerning Control of the Milk Supply". This report brought out many interesting facts, which when fully understood and appreciated will doubtless lead to some radical changes and improvements.

Dr. H. A. Harding, Head of the Dairy Department, University of Illinois, read a paper on "Simplified City Milk Inspection", which was generally discussed, as was also the paper presented by Dr. Wm. G. Bissell, Chief of the Bureau of Laboratories, Department of Health, Buffalo, N. Y.

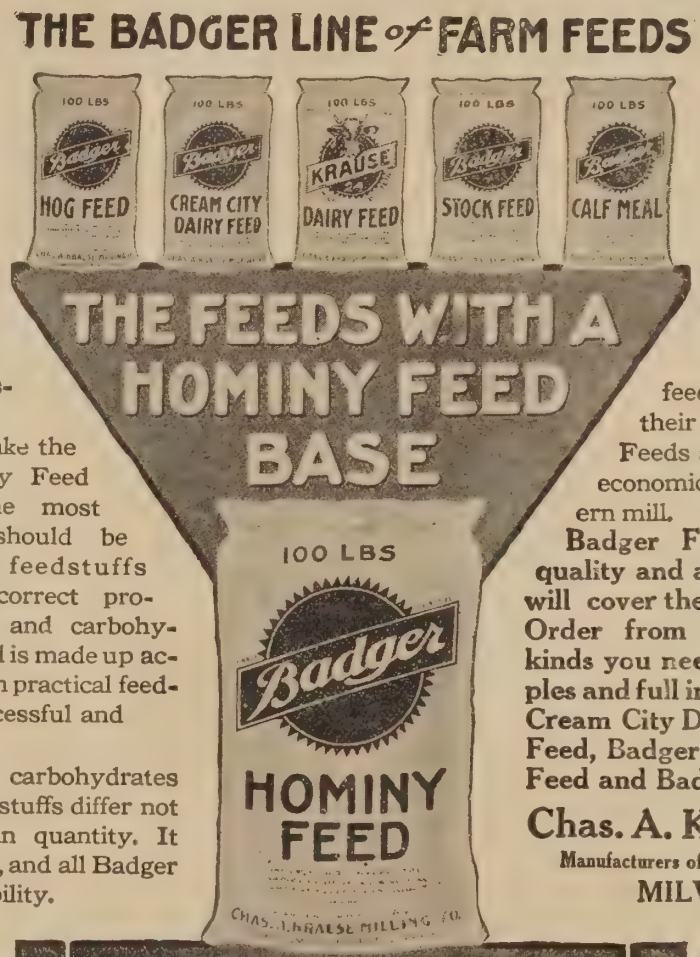
The quality of milk furnished government cantonments was described in a paper read by Mr. J. H. Sasseen of Columbus, Ohio.

Mr. Fred J. Moore of Detroit presented a paper on "The Pasteurization of Milk".

The report of the Committee on Organization of Milk Control was read by its chairman, Dr. Wm. H. Price of the U. S. Public Health Service.

The business session of the convention was held Wednesday afternoon, December 11th. Reports of officers were presented, and new officers for the ensuing term were elected as follows: President, James O. Jordan, Massachusetts; first vice-president, Hoyes Lloyd, Ontario; second vice-president, C. L. Roadhouse, California; third vice-president, Ernest Kelly, Washington, D. C.; secretary-treasurer, Ivan C. Weld, Washington, D. C.; auditors, Harry E. States, Michigan, and H. A. Harding, Illinois.

Among other invitations received for the next annual convention was one from the mayor and Chamber of Commerce of Buffalo, N. Y. Several new members were elected, and the convention was a decided success in every particular. IVAN C. WELD.



District of Columbia.

Why Badger Feeds Are the Most Economical

WHETHER a feed is economical depends not upon the price, but upon the results which it produces. Badger Feeds are the most economical because they contain the greatest amount of food value. A dollar's worth of the right Badger Feed will give you more profits than a dollar's worth of any other feed.

Each of these five famous feeds is a perfect balanced ration, containing exactly the right food elements for its particular purpose, and in exactly the right proportions.

And the base of each is Badger Hominy Feed, known for many years by the most successful feeders in the country as the most nutritious of all single feedstuffs.

Badger Hominy Feed is a carbohydrate feed which contains a larger percentage of tissue building material than whole corn. It includes the mill run of Corn Germ Meal, the germ or fatty part of the corn from which the oil has been extracted. In the process of milling it is partially cooked, increasing its digestibility.

No other feedstuff can take the place of Badger Hominy Feed as a base, but for the most economical feeding it should be combined with other feedstuffs which will give the correct proportions of proteins, fats and carbohydrates. Each Badger Feed is made up according to formulas which practical feeders have found most successful and economical.

The proteins, fats and carbohydrates contained in different feedstuffs differ not only in quality but also in quantity. It is digestibility that counts, and all Badger Feeds are high in digestibility.

Even if he were able to obtain all the required ingredients, no feeder could mix them at home with the thoroughness and scientific accuracy with which they are combined in Badger Feeds, prepared according to scientific formulas and proved by thousands of feeders. Nor can feeders take the time to mix their own feeds, when Badger Feeds are mixed so much more economically in our large and modern mill.

Badger Feeds are unvarying in quality and absolutely reliable. They will cover the needs of all your stock. Order from your dealer today the kinds you need. Write for free samples and full information about Badger Cream City Dairy Feed, Krause Dairy Feed, Badger Calf Meal, Badger Hog Feed and Badger Stock Feed.

Chas. A. Krause Milling Co.,
Manufacturers of the Badger Line of Farm Feeds.
MILWAUKEE, WIS.

Roots for Cows and Horses

Please give me the feeding value of parsnips, carrots, and red beets for cows, and also of carrots for horses.
Waukesha, Wis. H. C. L.

Carrots are especially relished by horses, and parsnips rank next in value. The great value of these two roots is that they help to keep the horse's digestion in good condition. The nutrients in grain for horse feeding are far cheaper than in carrots and, further, the horse's digestion is so constructed that he cannot consume sufficient quantities of carrots to be of any material value to him as far as nourishment is concerned.

Carrots and red beets have about the same feeding value for cows. They are worth a little more than half as much as good corn silage. In other words, in 100 lbs. of corn silage there are 17.2 lbs. of digestible nutrients, and in 100 lbs. of common beets there are 9.3 lbs. The dry matter in the beets is a little superior to the dry matter in corn silage. Parsnips have 11.6 lbs. of digestible nutrients in 100 lbs. This makes them a little more nutritious than the carrots or red beets.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Timothy

Timothy is undoubtedly the most popular hay grass in the northern and northeastern states although in recent years much has been said and written against it. There are several reasons why timothy is popular as a hay grass. First of all it usually brings an excellent price at the city markets. Horsemen like it because it is usually fairly even in quality and because horses will not gorge themselves with it. Alfalfa and clover contain more protein but, if allowed to, horses will often eat too much of them. Timothy is more of a filler, the horse getting most of the needed nutrients from its grain. Then, too, timothy seed is comparatively cheap and easy to obtain, the crop is easily cured and is cut later than clover or alfalfa. This last is a decided advantage in many states for the corn usually needs cultivation at about the time the first crop of alfalfa and clover should be cut for hay.

What disadvantages can we find for this crop? There are several and at least one of them should be of special importance to junior dairymen. Timothy is not as valuable a feed for dairy cows as is clover or alfalfa. When we feed roughages to our cows we want something more than a filler; we are looking for a roughage that will supply a large amount of feed as well. Not only is it a poor feed but cows and sheep do not usually relish timothy hay, especially when it was cut during the ripening stage. Another disadvantage lies in the fact that timothy produces but one crop in a season and usually does not produce a very heavy aftermath or late season growth. In fact, very often it grows but little for several weeks after the crop is harvested. It is rather slow to start in the spring and does not produce a dense sod, so it is not as desirable for a pasture grass as are some of the other grasses. Then, too, it is more easily injured by tramping and wet weather than is Kentucky blue grass.

In spite of the fact that timothy is not the most desirable forage crop for dairy farmers, we must remember that it is an important crop on many American farms. For that reason it will pay us to spend a little time studying it.

The name timothy probably comes from Timothy Hanson of Maryland who is supposed to have introduced the seed into this country from England about 1720. In the New England states the plant is often called Herd's grass, the name coming from John Herd, who is said to have found it growing wild in a New Hampshire swamp at an early date. A third name for the grass, and a very old one, is meadow cattail. This is due, no doubt, to the fact that the shape of the head resembles somewhat that of the ordinary marsh cattail.

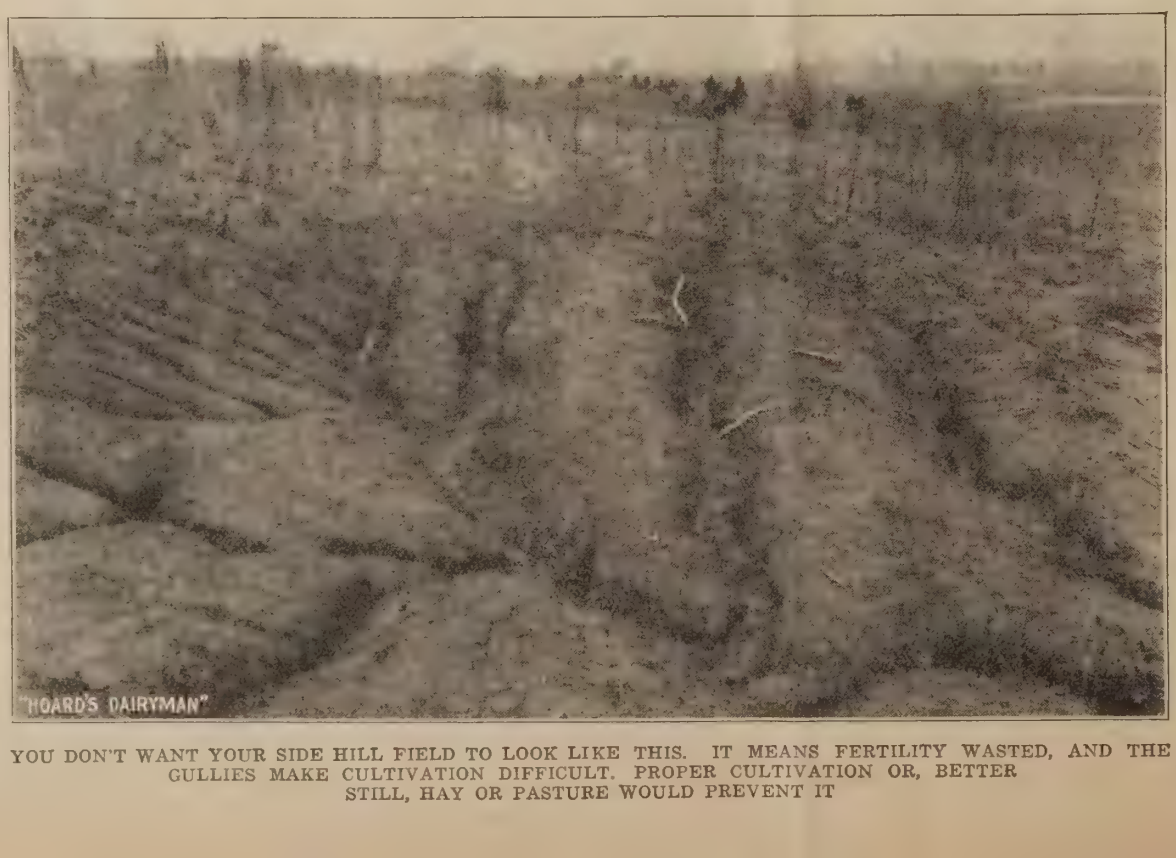
The plant itself is, as you all know, a member of the grass family. It is a perennial or one that grows year after year from the same root. The roots like those of many other grasses are fibrous, but they usually grow deeper than those of red top or blue grass. The culms or grass stems vary from a few inches to from three to six feet in height and are made up of several sections or internodes. The joints between these sections are called nodes. Now, have any of you ever pulled up a timothy plant? If you have, what did you notice about the last or lowest internode. It was probably swollen to form a sort of bulb which was shaped like that of a young onion. This bulb, or corm as it is usually called, is really a storehouse for plant food. At the same time that the plant is growing and forming seeds, it is laying up a store of food in these corms. For that reason when timothy is cut altogether too early, some of it may die out. The common field mice know that these little corms contain a store of food, and very often in the fall and winter they do considerable damage by eating them. The mice are apt to be especially troublesome when the aftermath is heavy in the fall.

Although timothy can be successfully raised in many parts of our country, it is especially well adapted to the North Atlantic and North Central States east of the Missouri river. In those sections on a fairly rich soil it grows luxuriantly and in the eastern states it is almost the only hay of commerce. The plant is hardy, does well in Canada, and has even given good results in Alaska, but in the states of the middle west there is too little rainfall for it. It will grow on many different kinds of soil but seems to be at its best on fairly moist, fertile land.

It enters into most of the rotations in the North Central and North Atlantic States, either alone or with clover. One of the most common rotations is corn and oats, followed by timothy and clover for one or more years.

Timothy when used for hay is usually either seeded alone or with clover. In either case it may be planted either with or without a nurse crop. The rate of seeding varies in different localities but usually about 15 lbs. of seed per acre is desirable when it is planted alone. With clover, about 11 lbs. of timothy seed and 10 lbs. of red clover seed will give good results although this amount is often varied. Now the question comes, at what time of the year shall we plant the seed? We might sow it at different times and still have good success, but usually it will be safe to do it either in late summer or in the fall with a nurse crop. If there is no danger of a dry fall, we can plant both the timothy and clover without a nurse crop in the late summer. The land should be prepared as for a grain crop and the seed planted at about the rate mentioned above. With plenty of rainfall, the crop will then get a good start in the fall and will furnish a hay crop the next season. If it is desirable to seed with a nurse crop the timothy is usually planted in the fall with rye or wheat and the clover seeded in the spring. Ordinarily the clover is planted in March when the land is cracked by frost and when further freezing and thawing will cover the seed. Another and better plan, so far as the clover is concerned, is to wait until later, say in April, and then to sow the clover and harrow it lightly to cover the seed. If this is properly done, it will injure neither the timothy nor the nurse crop. We have been talking about sowing a mixture of timothy and clover because that is usually most desirable on a dairy farm, but timothy may be planted alone in exactly the same manner except that about 15 lbs. of seed instead of 9 or 10 lbs. should be planted per acre.

When timothy is planted in the late summer, a crop of hay can be cut the next season but when planted with a nurse crop, it should not be cut until the second season. One advantage of using timothy for a hay crop is that it does not need to be cut quite as early as clover or alfalfa. It may be cut just before blosso... ing, during the blossoming stage, ju... as the seeds are forming, or after t... seeds have ripened. Now when ... you think is the best time? It wou... seem as though there would be mo... food in the hay if we wanted to c... it when the seeds were ripe, but t... is not true.



The seeds themselves are small a... have no food value for stock and ... this stage the stems are hard a... woody, so it will be more advisable ... cut for hay when the plant is in f... bloom or just as the seeds are for... ing. In general, if the hay is to ... fed to dairy cows, young stock, ... sheep, cut the timothy early, while ... it is to be fed to horses it may be ... later. The big disadvantage ... early cutting is that the hay is hard ... to cure, and for this reason late c... ting is often practiced.

Which is Best Feed, Early or La... Cutting?

Now, if you wanted to find ... whether early cut or late cut h... made the best feed, how would y... do it? One way to do this would ... to let the animals decide this ... themselves. Professor Waters ... Missouri decided to try this meth... He cut some of the timothy when ... was coming into blossom, some as ... was in full bloom, more when ... seeds were formed, when the se... were in the dough stage, and wh... the seeds were ripe. Then he fil... several feed racks, one with each k... of hay, and allowed steers, da... cows, and sheep to eat the kind th... liked best. The yearling steers wh... were receiving no other feed, show... a decided preference for the ea... cuttings and would not touch ... later ones until the other was go... Those which were getting plenty ... silage and grain in addition to ... timothy were not so particular ... ate the late cutting as readily as ... others. The dairy cows preferred ... first three cuttings as did all ... sheep except those receiving a he... feed of corn. Now, you can see w... it is advisable to cut early if the t... othy hay is to be fed to young sto... dairy cattle, or shee...

Timothy is one ... the easiest hay gras... to harvest and pr... tically all of you ... familiar with the pr... ess. The hay is mow... and allowed to cure ... it falls unless it ... very heavy when it ... comes necessary ... turn it once or tw... Of course, rains ... make this last proc... necessary. After c... ing it is sometim... raked and put i... small piles or ... cocks from which it ... hauled to barn ... stack. Very of... however, especia... where there is m... hay to harvest, it ... raked into windr... by a side delivery r... and loaded dire... from the windrow e... er by hand or wit... hay loader.

When it is to ... cut for seed, the gr... is allowed to st... until ripe. It...

YOU DON'T WANT YOUR SIDE HILL FIELD TO LOOK LIKE THIS. IT MEANS FERTILITY WASTED, AND THE GULLIES MAKE CULTIVATION DIFFICULT. PROPER CULTIVATION OR, BETTER STILL, HAY OR PASTURE WOULD PREVENT IT

Junior Letters

ard's Dairyman Juniors:—It is a long
since I wrote to the juniors but when I
the letter of Fremont Cook of North
ta I thought it was my duty to give him
mation about squab breeding. I have had
ns for three years and have had twenty
ent varieties of prize winning pigeons.
I sold them to my brother. This junior
s to know which breed is best for squab
ling. The Homers are about the fastest
ers in the fancy but their squabs do not
the highest prices at the markets. The
eaux are the most loved breed of pigeons
ie large squab breeders. They are larger
the Homers and about just as fast breed-
The Runt is the largest breed of pig-
These birds breed fast if they are not
ded too much. These are about the most
rtant varieties of squab breeding pigeons
here are still more that I know, such as
ses, White Kings, Mondanies and Show
ers. But if I would again go in the pig-
business I would get nothing but show
ns and exhibit them at the fairs and
ry shows and win ribbons and silver cups.
is the best fun in the pigeon business—
at the other fellow.
e best way for you to learn more about
ns would be to buy a squab journal and
it thoroughly. The reason that I went
of the pigeon business is because I am
g prize winning single comb White Leg-
chickens, some that have never been
n in fast competition and I think it is
to keep only one thing at a time if you
n a farm and have lots of other work.
there are any other juniors that want
now anything about pigeons I would be
to answer them if I can. I am sixteen
old and live about one mile from Myers-
and play baseball on the Reistville team.
will close now as I am afraid my letter
tting too long. My address is R. F. D. 4,
stown, Pa. Henry K. Miller.

ard's Dairyman Juniors:—Our hay wasn't
good this year. We had about three-
hs of what we had last year. The grain
pretty good. We are threshing our grain
We are milking 17 cows. We are get-
about 200 lbs. of milk a day. We filled
silo about two weeks ago but we didn't
it only half full.
saw in three or four of the junior letters
they are not having enough rain down
h. We are having too much rain the last
eks. About 25 acres of our pasture and
lows were covered with water Sunday.
have about one-eighth of an acre of po-
s this year. I haven't dug only a bushel
nem so far. I have also raised about 5
els of onions. I expect to sell them at
bushel.
have three war saving stamps and eight
t stamps.
ere are lots of apples around here. We
a lot anyway. Papa took some to the
mill and got about 28 gallons of cider.
am in the 7th grade in school this year.
pa gave me the full sister to Speck (the
r I told about in my other letter) for feed-
the calves last winter. We raised 11 last
er. I named my calf Surprise because
surprised me when she came one night.
rise will be one year old the 10th of De-
er. Speck will be 2 years old the 26th of
'ebruary. Surprise is not so speckled as
k is. She don't look so contented either.
are both black and white. Papa sold the
registered bull last spring. He weighed
lbs. at 7 cents a pound. Papa went and
ht another little one that wasn't a year
yet, he was registered, too, for $75.
think the Hoard's Dairyman juniors are
ight and I would like to become one of
.
took three plates of onions to the Canton
and one plate of potatoes. I took one
nd prize on one plate of my onions and
on my potatoes.
ishing the juniors good luck I will close.
ew York. Frederick Toncks.

Champion
Dependable Spark Plugs

For Ford Cars and Fordson Tractors

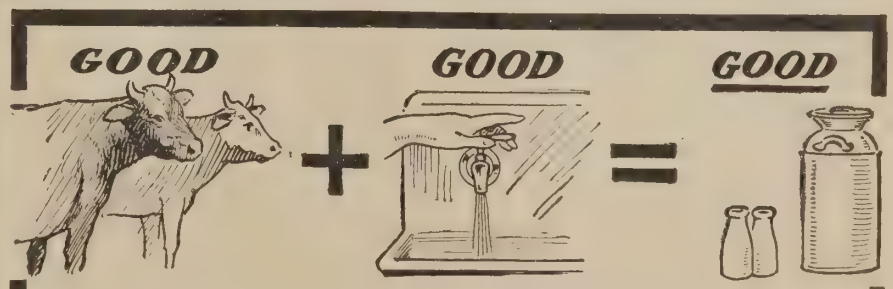
Read the advice of this authority, contained in the Ford Motor Company's instruction book placed in every Ford car:

"There is nothing to be gained by experimenting with different makes of plugs. The make of plugs with which Ford engines are equipped when they leave the factory are best adapted to the requirements of the motor."

Consider that the Champion Fordson tractor plug is also regular factory equipment in Fordson tractors and that Fordson builders recommend *this* plug to Fordson owners—

For **FORDSON** Tractors
Champion Fordson Tractor Plugs
Price **$1.00**

For **FORD** Cars
CHAMPION X
Price **90c**



Could there be stronger proof to guide you in the choice of spark plugs for *your* Ford car or Fordson tractor?

There is a Champion Spark Plug for every type of motor car, motor truck, tractor, motorcycle and stationary engine.

Champion Spark Plug Company, Toledo, Ohio
Champion Spark Plug Company of Canada, Limited, Windsor, Ontario

Wanted—Experienced herdsman, for pure-bred Holsteins, who has some extra help in family. Good wages, house and usual privileges. Reference required. Prefer man who has had some experience in A. R. O. work. M. L. JONES, Westtown, Chester Co., Pa.

Wanted—Married man without children for general farm work. Want wife to assist with milking. Board and room furnished. State wages. Write FRED WINKENWERDER, Watertown, Wis.

HELP WANTED

Wanted—Man and wife without children; wife to help with housework; must be good cook and housekeeper, man for dairy work, milking, bottling and delivery. Wages $70 per month, everything furnished. Give full particulars first letter. Address ROLLA OLIVER, P. O. Box 701, St. Joseph, Mo. 23-2

Wanted—Single man on grain and dairy farm; competent and experienced; good habits; in good home; state wages; come visit farm. L. A. KIMBALL, Lake Geneva, Wis. 23-4

Wanted—Good milker and farmer, for 40-acre farm close in to city. Must be good fast milker. $50 per month and board. ROUTE 10, BOX 61, Battle Creek, Mich. 23-2

Wanted—Single man for general work with Holstein herd. Must be a good dry hand milker. $50.00 per month and maintenance. Address MINNESOTA STATE SANATORIUM, State Sanatorium, Cass Co., Minnesota. 23-2

Wanted—Working foreman on small farm. Keep about thirty cows of milking age. Young stock. Extra pure blood Holsteins. Must be efficient in fitting cows for test, experienced in testing for A. R. O., understand the care cattle should have at all times. Sober, steady, industrious, reliable, honest and a live wire. Farm located in New York State. Will pay good wages per month and a bonus on records made. State wages, give references, all details first letter. Address BOX 364, care Hoard's Dairyman.

Wanted—Man with dairy experience to care and milk with Sharples machine 30 Guernsey cows; to put entire time with the herd. Must be capable to take entire charge and assume responsibility. Board and room furnished. State experience, reference and salary. ARTHUR A. COOPER, Elizabeth, Ill. 23-4

Wanted—Herdsman for one of the best herds in the state. Holstein. Semi-official yearly work. State experience, age and wages expected. JOHN PULS, Hartford, Wis. 23-2

Wanted—A person, able to invest in the business, to take charge of dairy. Milk collected at door by pasteurizing plant. Good summer pasturage, three new silos, new engine, cutter and corn harvester. Write for particulars if you mean business. L. W. DesCHAMPS, Elliott, South Carolina.

Wanted—Man and wife to work on farm. Wife to run small boarding house; man to do general work. Good wages paid reliable and industrious people. Enclose references and address BOX 358, care Hoard's Dairyman. 23-tf

Wanted—Housekeeper on farm, middle aged women preferred, three in family, modern house, furnace and bath. LOUIS BEYER, Malone, Wis.

Wanted—A superintendent for strictly modern dairy, located in the east, about six miles from a city of 200,000 inhabitants. Milk disposed of by retail. 600 acres under cultivation. This is a good berth for the right man. Apply to BOX 347, care Hoard's Dairyman, giving full particulars, experience and reference. Only first class man need apply. 22-3

POSITIONS WANTED

Wanted—Unmarried man wants position as manager of Eastern dairy, Holsteins or Guernseys. Life experience. $175 per month. Address BOX 357, care Hoard's Dairyman.

Farm Manager or Superintendent—Young man, single, American, desires permanent position. He had good practical experience in general farming with modern machinery. Address BOX 115, Kennett Square, Pa. 21-3

POSITIONS WANTED

Situation wanted as superintendent on large grain farm; married, no children; understand rotation of crops and handling of men. At present time on grain farm which will be sold soon. Can make a change Feb. 1, 1919. Address BOX 330, care Hoard's Dairyman. 21-3

Married man, two children. Best references as farm foreman or herdsman; also general farm work. H. Y. MAINES, Elkhorn, Wis. 22-2

General manager is open for position. Lifetime experience. Have thorough knowledge of pure-bred stock, also buying and selling. A. R. O. work, feeding and developing young stock, and can handle help to best advantage. Married, two children, no bad habits. Address BOX 341, care Hoard's Dairyman. 22-tf

Wanted—Young man wants herdsman job in far west. No small job considered. Holsteins only. Former employers affirm I made their interests mine. $150 per month. Address BOX 356, care Hoard's Dairyman.

Practical man with life farm experience, also experience in cow testing and agricultural improvement work desires position as manager or herdsman on dairy farm. Only good propositions will be considered. Will guarantee results. College education. Will consider a renting proposition. Guernseys preferred. BOX 353, care Hoard's Dairyman. 22-3

Young single man, of proven character and worth, wants position as herdsman of Southern dairy. Only large proposition considered. Must furnish sufficient labor to conduct business efficiently. Lifetime experience North and South. $200 monthly and board. Address BOX 355, care Hoard's Dairyman.

Wanted—Position as farm manager. Honest and sober. Western farm preferred. Understand farming thoroughly. M. H. BRINKER, Lisbon, Ohio. 23-2

Position wanted as herdsman. Single, experienced in A. R. O. work, best of references, only Holsteins considered. BOX 354, care Hoard's Dairyman. 23-2

Wanted—By man of ability and experience as well as good training a position as superintendent of large stock farm or estate. Am thoroughly experienced. Only those of best reputation considered. Address BOX 366, care Hoard's Dairyman. 23-spl

An experienced American herdsman of 5 is open for engagement January 1st. Understands every branch of dairy and record work. Can take full charge first class modern position only. Address BOX 362, care Hoard's Dairyman.

First class herdsman wishes position. Thoroughly experienced, competent all branches. Expert calf raiser, milker, veterinary work. Particulars address BOX 359, care Hoard's Dairyman.

Married man wishes position on dairy or grain farm. Wife willing to work as housekeeper or board help. Address BOX 360, care Hoard's Dairyman.

Do you need a good herdsman, working foreman for farm or estate? Several men graduating from the National Farm School are open for employment. M. ROSENBERG, National Farm School, Bucks County, Pa.

Wanted—Position as herdsman. Single, middle aged, sober. Up-to-date feeder in A. R. O. work. 6 years head feeder at the Woodcrest, Rifton, N. Y., when the farm was under the management of A. S. Chase. Best reference. FRANK BROWN, 668½ 27th St., Milwaukee, Wis. 23-2

Better Cows for Iowa

e Iowa Holstein-Friesian Breed- Association has secured the ser- of Mr. H. E. Colby, formerly r of the Holstein-Friesian World, vote his entire time to the pro- n of the interests of the Hol- Friesian breed in Iowa.

e believe Iowa is the first state cure the services of some one to te his entire time to promoting nterests of any breed. Mr. Col- headquarters will be at Waterloo, nuch of his time will be spent in ing out the gospel of more and r Holsteins. The men putting shoulders to the wheel in this t realize that the results may slowly at first, but they have in the Holstein cow and they that the men of Iowa, who are ucing milk, would be benefited if can be prevailed upon to use blood rather than scrub or cows eef blood.

With Milk and Honey Blest

gs and sugar, milk and honey, —always excepting, of course, continued stimulation of our grain —are now figuring uniquely ig the food supplies of our coun- o be maintained and increased. is true not only because of their importance, but because they are rtant foods that can be economi- produced. Whatever unprece- ed gains in agriculture or produc- have been made last year and this, otal food output for 1919 must k all previous records. More food still more food is what is needed od, again food, always food, and more food—and the kinds that feed best and most for the least cost, or that can be produced with little initial outlay and labor, now count highest.

This is a thought that belongs not to the farmers of the country alone; it is a thought that must be roundly grasped by the men and women of our towns and cities. In their clear comprehension of food, both from the standpoint of its feeding value and its production cost and possibilities, and their acceptance or use accordingly, now lies one of the biggest factors of help in the solution of the present food problem. While the garbage-fed hog is proving what can be done to economically increase our supply of pork and allied foods, and while the energy value of sugar for what it costs to give it to us is an old, old story, no other one food meets the first present economic food ideal better than milk, and possibly no other one food meets the second ideal better than honey.

The value of milk as a food has been so emphasized during the past months that we are now more than familiar with the facts "that milk is the greatest factor of safety in our diet"; "that no substitute for milk as a food has ever been found"; "that children under six years of age should have if possible a quart of whole milk a day"—in some form at least; "that meat does not take the place of milk; more, that it is a mistake to buy any meat until each member of the family has a pint of milk each day"; that milk is from all practical points of view an economical food, and that "without the continued use of milk not only for the feeding of our children but in liberal amounts in cookery, we cannot as a nation maintain the position as a world power to which we have arisen."

But the dairy cow does not only produce this most needed and in many respects best of all foods, the dairy cow is at the same time the most economical producer of any animal food. As the experts tell us, one great law of food conservation is "to turn inedible feeds into edible foods," and it is the dairy cow that can most efficiently utilize coarse, otherwise inedible materials and convert them into milk. This has been demonstrated and must be more unhesitatingly understood than it now is, perhaps. The degree of efficiency and economy, however, with which milk is produced depends upon the breed and the physical condition of the cow. In order to increase our milk supply and further cut the cost of its making, not only more, but better cows are needed. Cow testing stations, through whose agency it is possible for even the poorest farmer to own high grade cows, are proving that by intelligent breeding and feeding the average production of a cow, measured in butterfat, may be increased 50 per cent or more, and its cost greatly reduced. That this increase may continue, and the country be strengthened accordingly, the value and importance of milk and other dairy foods must be more commonly recognized, and their fullest use consistently observed, and whatever fair price for milk may be justified at the time should be patriotically paid. More—the cry "more and better cows" must be called and carried from coast to coast!

If we cannot all be farmers or producers of food in some capacity, at least we can all become familiar with the many issues in the production of our various foods and their ultimate value, and lend our co-operation by the practical appreciation of these two facts, and so pay to an extent whatever personal debt in the matter of food production may be charged against us. At this critical period the importance of milk and honey from the nutritive and economic aspects can hardly be overestimated, for it may be only when we have again found the Promised Land that permanent peace shall come.—MABEL DULON PURDY in McClures Magazine.

When Bull Ring Tears Out

HOARD'S DAIRYMAN:—In your issue of Nov. 22 I saw an inquiry in regard to handling a bull that had pulled ring through his nose. I had a case of this kind with a large bull I was caring for a few years ago.

I put the ring back the other way of the nose, going through nose and lip and coming out of the mouth. I used a large ring (3"x½") thus reaching well above lip where flesh was thin.

It was quite a difficult job to hold the animal while hole was cut through nose. We used staff to handle him same as before and with apparently equal results. The ring gradually worked down in nose, but we could see no change in position in lip and do not think there would be a material change in a few years or any difficulty in handling bull with ring through lip alone should ring come entirely out of nose. I would not advise tying direct to ring. While this method would probably make grazing difficult, it did not bother bull to eat hay and grain. SUBSCRIBER.

A New Junior Dairy Club

HOARD'S DAIRYMAN:—To stimulate interest in dairying and to train up dairymen for the future is the object of the new junior dairy club in Oklahoma. The requirements for this boys' and girls' club which were formulated by John E. Swaim, State Boys' Club Agent, and C. W. Radway, State Dairy Specialist, are different from those of any other state.

Each boy or girl who becomes a member of this organization must purchase a high grade heifer or cow of a recognized dairy breed; the animal should be bred at the time it is purchased. Cost and production records must be kept as long as the member remains in the club.

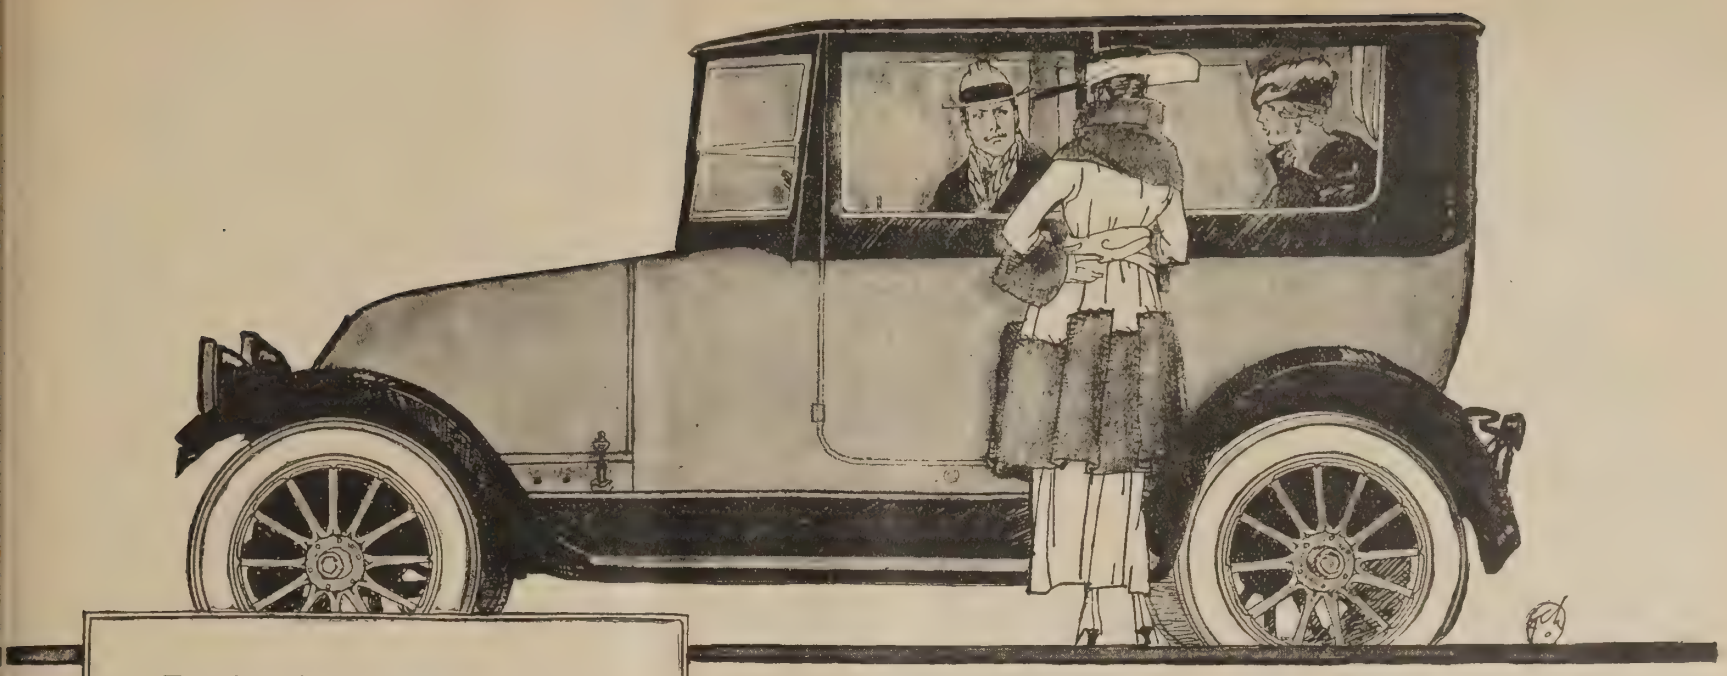
The junior dairy work is carried on through the county agents under the supervision of the Boys' Club Department of the Extension Division of the Oklahoma Agricultural and Mechanical College in co-operation with the U. S. Department of Agriculture. The county agent enrolls the members, assists them in purchasing their cows and personally supervises their work as much as possible. Seasonable instructions and suggestions are sent out bi-monthly by the club department. The junior dairymen must read these instructions and follow them whenever practicable.

At the time he enrolls each member is given a record book, in which he must keep an account of all expense and production as soon as he assumes ownership of the cow or heifer. The book is so arranged that one page is devoted to the daily production for each month, the opposite pages having blanks for the monthly record of feed for both cow and calf. Butterfat tests must be made at least four times during the year. The completed record book together with a story of the year's work is turned in on September 30th of each year to be graded. A new record starts as soon as the old one is completed.

Each member is required to make an exhibit at the county fair or club contest. This exhibit may consist of either the cow or one of her offspring. The best animals are then sent to the state fairs where they are shown against cows and calves from other counties.

In making out the grade for the year's work of each boy and girl, four points are taken into consideration as follows:

Exhibit	25
Yearly production	25
Profit	25
Completeness of record	25



The exhibit grade is taken from the showing made at the state and county fairs. The other three are taken from the record book.

The junior dairy club is to be a permanent affair. The boy remains a member as long as he does up the work and follows out his instructions. As soon as the first calf matures and begins giving milk, its production record is kept along with its mother's.

The club work builds for the future. The cows and heifers must be bred to pure-bred bulls of creditable production. This rule insures the building up of the quality of stock owned. A boy or girl who continues this work for a period of five or more years will be the possessor of a splendid dairy herd and will have made a good start toward becoming a successful dairyman.

Oklahoma. W. J. GREEN.

One of the most common mistakes in the feeding of dairy cows is that the good cows are not given a sufficient quantity of feed above that required for their physical maintenance to obtain the maximum quantity of milk they are capable of producing.

Franklin Light Weight and Air Cooling add to Franklin fineness a day-by-day delivery to the owners of–

20 miles to the gallon of gasoline —instead of 10

10,000 miles to the set of tires —instead of 5,000

50% slower depreciation than any other fine car.

There Are Hard Days Ahead For the Wasteful Motor Car

TODAY when you are considering a motor car, you have something more definite in mind than a year ago, because your standard is bound to be different than it was then. You are buying a car to ride in—*as much as you require*—but you are naturally more exacting as to costs, comfort, and staying qualities of the car.

Everybody recognizes the fact that the performance of motor cars in general is unchanged. And the live question now is which car will give you a *full measure* of usefulness—and still stick to the new standard of *keeping down waste.*

Cars that insisted upon bulky, wasteful, rigid weight before the war now find themselves out of line with the trend of public thought and unable to change for months to come on account of the material situation. And with the people frowning upon waste, there will be hard days ahead for the wasteful motor car.

It's all summed up in the old question of unnecessary motor car weight and rigid construction. Unnecessary weight means unnecessary expense to move it—more fuel; and, combined with rigidity, it gives tires no chance to wear out—they are pounded out long before they should be.

The Franklin Car, on the other hand, anticipated these requirements sixteen years ago. It has always been built on the principle of utility, cutting out all excessive weight at the outset, and relying on flexibility instead of rigidity, and now, without change, it meets your need and desire for a car to use—a car to ride in with the utmost safety, comfort and reliability at the least expense.

The fineness of the product is best indicated by the facts of Franklin performance in the hands of owners under all conditions.

Feeding Value of Sudan Grass Hay

HOARD'S DAIRYMAN:—Amongst the forage crops that have been introduced into the United States quite recently is Sudan grass. Although little more than ten years have elapsed since its introduction from the valley of the Nile it has spread rapidly in this country and is now quite a valuable crop in many sections, though it is specially adapted to the semi-arid regions.

Sudan grass has been used for pasture, soiling, and hay but seems best suited for the latter purpose. It does not tiller well and is an annual and so is unsuited for pasturing and the fact that it tends to become dry and fibrous limits its availability as a soiling crop. Where it is sown rather thickly, however, and in plots small enough to be used before it becomes too dry, it can be successfully used for soilage purposes.

As a hay crop it is quite successful. The yields obtained at ten state experiment stations average 3.4 tons per acre of dry hay and in some cases as high as 5.5 tons per acre have been secured.

Forage crops when ripening generally change rapidly in composition; not only does the moisture content decrease but the percentage of fiber in the dry matter increases rather markedly. Sudan grass is an exception to this rule as is shown by the analyses, in table 1, made at the Iowa State College.

As the moisture decreases and the dry matter content increases in the later stages of growth of Sudan grass, a few minor changes take place in the relative proportions of the individual constituents of the dry matter. Peculiarly, however, there is no marked increase in the content of crude fiber. The results given show more fiber at the time of heading out than when the crop is ripe. This difference is small, however, and can possibly be explained by the fact that Sudan grass yields a large amount of seed of a very low crude fiber content.

Table I. Per Cent Composition of Dry Matter of Sudan Grass at Various Stages of Growth

	Before heading	Headed out	Full bloom	Half ripe	Ripe
Total dry matter	20.80	20.96	25.74	30.08	31.92
Protein	8.80	9.78	6.57	5.02	4.29
Nitrogen-free-extract	48.12	46.04	50.19	53.32	53.73
Crude fiber	32.98	35.50	32.36	32.98	33.83
Ether extract	2.31	2.62	3.53	2.10	1.66
Ash	7.79	6.06	7.35	6.58	6.49

Table II. Digestion Coefficients and Digestible Nutrients in 100 Lbs. of Sudan Grass Hay

	Total nutrients lbs.	Digestibility %	Digestible nutrients lbs.
Dry matter	91.6	63.5	58.2
Protein	7.7	43.4	3.3
Nitrogen-free-extract	48.3	66.3	32.0
Crude fiber	30.9	69.4	21.4
Ether extract	1.8	52.7	.9

This lack of increase in the crude fiber in Sudan grass with the progress of ripening is of considerable practical significance. Crops to be used for hay must generally be cut before ripening has proceeded too far, otherwise the hay will be coarse, woody, and unpalatable and a large amount of it will be wasted. In the case of Sudan grass, however, the cutting can be delayed for a considerable time without any resultant damage to the hay. This is valuable during unsettled weather as the cutting can be delayed if there are prospects of the weather improving and the results will be entirely favorable whereas with other crops the hay would be exceptionally poor.

Although Sudan grass has been widely grown, little information has been obtained regarding its actual feeding value or digestibility. A digestion trial conducted at Iowa State College with two grade Guernsey heifers gave some very interesting information regarding its value—t only other information on this po being a digestion trial with one a mal at the Maryland Station. (S Table 2.)

The average for the Iowa a Maryland results shows Sudan gr hay to be quite digestible and t work at these, as well as other s tions, shows it has a valuable c tent of total nutrients. The result that Sudan grass hay is quite a va able source of digestible nutrients farm animals:

Table III. Digestible Nutrients and Net En Values per 100 Lbs. Dry Matter

	Timothy hay	Millet hay	Su gr
Crude protein, lbs.	3.4	5.8	
True protein, lbs.	2.5	4.6	
Carbohydrates, lbs.	48.4	53.6	5
Fat, lbs.	1.4	2.1	
Total nutrients, lbs.	54.0	64.2	6
Net energy, therms	48.7	54.8	6

Sudan grass hay can not be co pared satisfactorily with legume h but a good comparison with timot millet, and other non-leguminous h can be obtained. It is deficient in p tein but as is seen from the acc panying table it provides as much tal nutrients per 100 lbs. dry mat as does millet and is a much more uable source of energy than is eit timothy or millet.

Sudan grass hay is quite palata and should make a good horse h Owing to its lack of protein it not be recommended highly as a roughage for milking cows but i quite satisfactory as a winter roughage for dairy cows and yo stock, though for the latter a suit supplement in the form of some trogenous concentrate should also provided.

ANDREW C. MCCANDLIS
Iowa College of Agriculture.

Feeds to Supplement Silage Alfalfa and Alsike Hay

I have plenty of good corn si and alfalfa and alsike mixed al half and half and plenty of corn barley. Now I wan know which is the feed to add to tha make milk,—Unic cottonseed meal, meal, or bran?

O.

Belle Center, (

With good corn lage and mixed al and alsike hay, the little difficulty in plying the cow wit adequate amount nutrients. A cow w do very well on no but this roughage, der most condit however, and espec with the present of dairy products, we believe it to feed some grain.

The natural supplement of al hay is corn or barley. In vie this, we have suggested rather eral amount of corn and barley mixture. We would feed each 30 lbs. of silage at the rate of lbs. live weight, and all the al and alsike hay she will consume out waste.

A mixture consisting of 200 ground corn, 200 lbs. ground b 100 lbs. Unicorn or cottonseed or oil meal, and 100 lbs. of would supplement this roughag mirably. We would feed abou pound of this mixture for each of average testing milk produce cows giving less than 18 lbs. o daily, we would feed no grai require them to do their work alfalfa hay and corn silage, some particular cow was thin i and it was desirable to put better physical condition.

If The War Had Continued!

If the war had continued, the pair of U. S. "Protected" rubber boots that you will now be able to buy at your dealer's this winter would have gone to France for one of the boys "over there."

But, as the trenches are empty, there is no need for trench boots; so our Government is now allowing us to provide heavy-service, double-duty U. S. "Protected" rubber footwear for the outdoor worker at home.

Uncle Sam has furnished "our boys" with the best rubber boots that money can buy, and, in both the Army and Navy, there probably are as many U. S. "Protected" rubber boots as all other brands combined.

U. S. "Protected" rubber boots will outwear any ordinary rubber boots. The "boys" will tell you so when they come back. Every pair is sturdily constructed, reinforced where the wear is hardest, staunch and serviceable, and yet full of comfort. Every pair of "U. S." means warm, dry, comfortable feet for the wearer, whatever the work or weather.

The "U. S. Seal"—trade mark of the largest rubber manufacturer in the world—is on every pair of U. S. rubber boots. Look for it. It is your protection.

United States Rubber Company

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Depraved Appetite

I have a heifer calf four months old that licks and "cribs" the woodwork around her tie-up. The woodwork in question has been treated with "carbola", a chemical whitewash. Thought possibly this preparation might contain something she craves that is lacking in her ration.

Hopkinton, N. H. T. A. H.

Lime often is attractive to calves and for that reason it is well to allow access to a lump of chalk or to slaked lime. Cover the licked parts with turpentine. Allow access to rock salt. The heifer should be fed milk daily in addition to other feed.

Difficult Milking

I had trouble with one of my cows last year when she started to milk hard with her right front teat and then went to the left and then to the back. But the 2 front ones were the worst. I could hardly get any milk out of them. This lasted about two months and now she is starting the same way again.

West Burlington, Ia. B. G. R.

We suspect that congestion and consequent thickening of the lining membrane of the ducts in the teats causes the difficulty in milking. It may be due to infection from the milker's hands or stall floors. See that these are kept clean. Twice daily immerse the teats in a hot, saturated solution of boric acid and if that does not suffice, use sterilized dilators or teat plugs to enlarge the openings of the teats.

Sweating

I am writing to you in regard to one of our heifers which seems to have a very peculiar complaint. We have spoken to several dairymen about her and none of them ever heard of such a condition. She will be two years old in February and we expect her to freshen in March. She is of fair size and in good flesh and has a good appetite but she sweats at night. In the morning she is covered with tiny drops of sweat. It seems to be the worst on her hips and shoulders but often she is wringing wet all over. Her feed is silage (all she will clean up twice a day) and corn fodder for roughage and oil meal and cottonseed meal for grain. Two other heifers that stand beside her do not sweat.

Hopkins, Mich. S. F. M.

Such sweating sometimes is due to a hot, badly ventilated stable. Have the stables kept clean and so well ventilated that the temperature will not exceed 50 to 55 degrees Fahrenheit. Indigestion is another common cause and we should advise you to reduce silage a half and feed clover hay, oats, bran, and flaxseed meal. If she is constipated give her an ounce of glauber salts once daily in water and increase the dose if found necessary.

Caked Udder

I have a Holstein cow due to freshen about the 18th of December that at previous freshenings has had a badly caked udder. Last year, for instance, she freshened Nov. 20th and it took until about March 10th to get the cake out of one front quarter of her udder. Would it be advisable to milk a cow a few days before freshening?

Wadena, Minn. E. L. H.

Allow the cow a box stall or turn her loose in a shed. Make her take exercise daily. Stop all grain feed, reduce silage a half and feed enough bran and oil meal in form of mash to keep the bowels active. Twice daily massage the udder and if it becomes greatly enlarged, strip away some of the serum twice daily. Once daily give a tablespoonful of saltpeter in water or feed after calving if the udder stays congested, and milk three times daily.

Skin Trouble

Can a cow have mud fever? If so, what is the proper treatment?

Can a cow be affected with cowpox for an indefinite period?

I have a cow that got a sore on her udder three years ago which was treated with creolin. Since then she is continually getting sore places which are covered by a very hard crust (dark in color), covered with hair. After treatment with creolin and lard, this comes off and heals, but it will crop up again on another leg.

Duncan, Vancouver Is. G. H. T.

Mud fever is a disease of the legs of the horse due to wading in wet slush or filth and we do not recognize such a disease in cattle; but such conditions may cause "fouls" (foot trouble).

Cowpox runs a definite course inside of three weeks. What our inquirer describes possibly is ringworm or eczema. Saturate the spots with oil until the crusts can be scrubbed off; then apply tincture of iodine twice daily, or a solution of 4 ounces of sulphate of copper in a pint of hot water, to be applied once every five days. Cleanse, disinfect, and whitewash the stable.

Jersey Cattle Notes

For week ending Dec. 6, 1918:

Number of animals registered: Bulls, 178; cows, 462; total, 640.

Number of transfers recorded: Bulls, 230; cows, 595; total, 825.

Do the home grounds look pretty bleak these cold days? Wouldn't a little shrubbery or a few trees improve the appearance, in winter as well as summer? The long, winter season makes evergreens valuable.

Don't Keep and Feed A Barren Cow

But Make Her Breed by a Thorough Treatment with

Hood Farm Breeding Powder

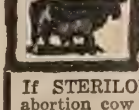
Success is Practically Certain.

Hood Farm Breeding Powder is really

A Marvelous Preparation.

It restores the reproductive functions.

It corrects the irregularity of cows and heifers that do not come in season.



It removes the irritation and restores the organs to normal condition in cows that are constantly in season.

It is antiseptic, soothing and healing.
It does NOT harm a cow or heifer.
It does NOT cause straining.
It is easily procured, easily administered,
AND ECONOMICAL.

Order today, mentioning this paper.

Prices, prepaid, $1.15, $2.75 and $5. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75.

Poultry Maxims

It is urged that all farmers and poultrymen adhere strictly to the following principal rules in handling their poultry and eggs:

1. Keep the nests clean; provide one nest for every four hens.
2. Gather the eggs twice daily.
3. Keep the eggs in a cool, dry room or cellar.
4. Market the eggs at least twice a week.
5. Sell, kill, or confine all male birds as soon as the hatching season is over, so as to produce infertile eggs. The male bird has no effect on the number of eggs produced.

GUERNSEYS

GUERNSEYS

Tabulations made by the U. S. Department of Agriculture show that the average income over cost of feed from one cow that produces 450 lbs. fat is equal to the average income over cost of feed from 20 cows that produce 100 lbs. each. The average of all official Guernsey records is 450 lbs. fat. Learn more about these profitable cows. Ask for our free booklet "The Story of the Guernsey".

Winterthur Farms
OFFER FOR SALE
King Sadie Vale Urma 235352

Born March 30, 1918

Here are the records of his nearest dams:

DAM (two-year-old)	*20.04 lbs.*
ONE GRANDAM	*38.46 lbs.*
THE OTHER GRANDAM	*25.50 lbs.*
ONE GREAT GRANDAM	*41.06 lbs.*
ANOTHER GREAT GRANDAM	*41.06 lbs.*
The five average	*33.22 lbs.*
His 7 nearest Dams average	*31.27 lbs.*

Like his sire, he is dark in color, long, straight and deep-bodied.
The sire, King of the Sadie Vales, is out of a 38.46-lb. cow. His dam's dam is also his sire's dam, namely: Sadie Vale Concordia 4th (41.06 lbs. butter). His dam and grandam have the highest 30-day averages in the World, 157.71 lbs. butter. No other bull in the World can equal his three to nine nearest dams for 30-day butter production. The sire of King of the Sadie Vales is the only bull in the World with a 40-lb. dam, a 40-lb. sister and a 40-lb. daughter.
The dam of King Sadie Vale Urma recently made as a two-year-old: 20.04 lbs. butter, 399.20 lbs. milk (7 days); 73.26 lbs. butter, 1,571.30 lbs. milk (30 days). Her dam has a 25.50-lb. record, and her maternal grandam has a 26.38-lb. record. She is a granddaughter of Sir Urmagel Burke (three 30-lb. daughters), and a great granddaughter of Pontiac Korndyke (two 40-lb. daughters).

We have put the price on this bull that will put him well within reach of the small breeder. For further particulars, write, wire or come to

WINTERTHUR FARMS
WINTERTHUR, DELAWARE

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.
Susquehanna Farms, Hartwick Seminary, N. Y.

A Grandson of the Famous $50,000 Bull

Here is a show bull, about three-quarters white, born Sept. 27, 1918. His sire is one of the best bred sons of the World's Greatest Sire,

KING SEGIS PONTIAC ALCARTRA

His dam has a junior three-year-old record of 22 lbs. butter and 482 lbs. milk. His ten nearest tested dams average 28 lbs. butter. Price $135. **G. G. BURLINGAME, Cazenovia, N. Y.**

A SON OF KING OF THE PONTIACS
The World's Greatest Proven Sire
For $350

This is half his value—but his color is against him, as he is nearly all black. He was born in August, is a splendid individual, and is out of a 19-lb. 3-yr.-old. Don't miss this chance of a life time.

Geoffrey G. Burlingame, Cazenovia, N. Y.

A Chance to Buy a Son of King Korndyke Sadie Vale

At less than half his value, because he is dark in color. $400.00 buys King Korndyke Segis Johanna Ormsby, born Aug. 17, 1918. He is a large growthy fellow and a fine individual. His dam and sire's dam average over 35 lbs. butter in 7 days. Sire:—King Korndyke Sadie Vale, regarded as the greatest sire of his generation. His daughters, still heifers, are making wonderful milk and butter records. One K. K. S. V. Topsy made over 40 lbs. butter as a 3-yr.-old. He also has two other 3-yr.-olds with records over 30 lbs., and two 4-yr.-olds over 30 lbs. He is the sire of the youngest 29-lb. heifer of the breed. Dam:—Anna Johanna Ormsby, A. R. O. record as follows, butter 7 days 29.35, 30 days 122.30 lbs. She is one of the best daughters of Sadie Vale Sir Ormsby. Thus this young Bull has a double cross of old Sadie Vale Concordia.
W. D. ROBENS, POLAND, NEW YORK.

A Rare Chance
To secure a few choice
Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.
River Meadow Farms, Portlandville, N. Y.

Holstein Heifers

325 High grade heifers 1½ to 2½ years old, bred to freshen this fall and early winter, large, well marked, fine condition.

50 Registered yearling heifers, beautifully marked, very well bred, good size, nice condition, extra fine lot.

35 Registered heifers, bred to freshen early this fall, practically all springing now, fine individuals, bred to good bulls.

Positively the best lot of registered and high grade heifers ever offered for sale in New York State. Buy now before the price advances.
J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Owing to Long Continued Illness—

I have decided to sell immediately part or all of the Lakeside Herd, including heifer calves, yearling heifers, bred heifers, cows and bulls of various ages, several of them from dams with records of 30 to 35 lbs. butter in a week. A rare chance for parties who wish to breed a high class, embracing individuality, breeding and production. **E. A. POWELL, 904 W. Genesee St., Syracuse, New York.**

At Laurel, Mississippi
40—HEAD—40

of high class grades and pure-bred registered Holstein cattle, all ages, males and females; some are fresh, some to freshen soon. Priced for quick sale. For further information and prices write H. H. Wickwire at Laurel, Miss. or write him at Hubbardsville, N. Y.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.
Henry Stevens and Son, - Lacona, N. Y.

MARKHAM & PUFFER, - AVON, N. Y.

Sir Inka Prilly Segis Albino

Born Dec. 3rd, 1917.

A Real Bull For Some Small Breeder.

IF YOU ARE A SMALL BREEDER or beginner in the Holstein business and in the market for a herd sire, here is one that is worthy of your best consideration.

JUST A YEAR OLD—Ready for service. He is well grown, a splendid individual with faultless topline and marked nearly all white. As an individual he will suit the most particular.

SIR INKA PRILLY SEGIS, his sire, is one of the famous sons of the great King Segis, who has proved himself to be one of the greatest, if not the greatest, transmitting sires of the breed.

THE DAM OF SIR INKA PRILLY SEGIS is Inka Prilly with a record of 30 lbs. in 7 days. She is from a 25-lb. daughter of old Prilly and sired by a grandson of this same famous foundation cow.

THE DAM OF SIR INKA PRILLY SEGIS ALBINO is Princess Douglas Urmagel, a 24-lb. four-year-old daughter of Sir Urmagel Burke, a full brother to the 35-lb. cow, Urma Burke, and from the 31-lb. cow, Urmagelsche 2d A.

PRINCESS DOUGLAS URMAGEL is from a 29-lb. four-year-old daughter of DeKol Beets Segis, another well known son of King Segis.

THE THREE NEAREST DAMS of this young bull average over 28 lbs. Two of them being only four-year-olds. His seven nearest dams average 26.93 and his eighteen nearest dams average 26.77.

HE CARRIES THE SAME RELATIONSHIP TO King Segis as Segis Fayne Johanna, the only 50-lb. cow, Fancher Farm Maxie, the world's champion heifer with 47 lbs., and Mabel Segis Korndyke, former champion four-year-old with 40.32 lbs.

HE CARRIES A DOUBLE CROSS of both King Segis and the famous foundation cow, Prilly,—both animals familiar to breeders from coast to coast.

AND WE ARE OFFERING this young bull to you for $650, guaranteed sound in every respect and tuberculin tested by Federal veterinarians.

IF YOU WANT HIM, do not wait to write but send us a wire instructing us to hold for you.

The E. C. Schroeder Farms, Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

If You Want Milky Bulls

Write at once

Winship Stock Farm, Owatonna, Minn.

A Grandson of

Sir Pietertje Ormsby Mercedes

FOR SALE

How About a Herd Sire?

MUTUAL FOBES LONGFIELD DEKOL 82959
A Splendid Son of His For Sale.

The Calf—M. M. Tritomia Fobes Longfield was born Feb. 2, 1918. He is nearly white, as straight as a line, and very well grown.
His Sire—Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters and a large number of younger ones coming on that will be retained in our herd. His sire is one of the good sons of Mooie Mutual DeKol and his dam, a daughter of Homestead Jr. DeKol, made 30.04 lbs. butter, 630.80 lbs. milk in 7 days as a jr. 3-yr.-old; 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days. (World's record when made).
The Dam, Milford Tritomia Fobes Homestead, a daughter of Canary Fobes Bessie Homestead, made 17.35 lbs. butter, 358.2 lbs. milk as a jr. 3-yr.-old; the second dam 17.38 lbs. butter, 408.3 lbs. milk; third dam 22.19 lbs. butter, 488.40 lbs. milk.
This is an excellent combination of breeding, the sire of this youngster and his dam's sire both being from daughters of Homestead Jr. DeKol, both with records above 30 lbs. butter and 600 lbs. milk.
The calf is priced within reach of any small breeder. Write us today for complete information about him.

MILFORD MEADOW'S STOCK FARM, Lake Mills, Wis.

HOLSTEINS Registered and Grade Holsteins of all ages and both sexes for sale. Can furnish several car-loads of excellent females due to freshen this fall, ready for immediate shipment. Several bulls ready for service.
GUERNSEYS We have an excellent lot of grade and pure-bred Guernsey females. Can supply a carload of cows and heifers due to freshen before winter. All in calf to good sires.
PERCHERON HORSES We have several registered fillies and young stallions; also two aged stallions that we will sell for less than their real value if taken at once.
DUROC JERSEYS Anything you want in Duroc Jersey Swine.
All cattle sold on a 60-day retest guarantee. Write us at once before the best ones go.

EDGEWATER STOCK FARM, Fort Atkinson, Wis.

Cloverlawn Johanna Piebe
His five nearest dams average 1,070 lbs. of butter, 23,809 lbs. of milk a year. Highest yearly record bull of the world 2 years old or over. Choice young bulls from our large yearly record cows for sale. 125 head. 29 yearly record cows. State exactly what you want.
JOHN PULS, - HARTFORD, WISCONSIN

A Bull That Will Suit You
He's sired by Dutchland Colantha Belle Boy whose dam is a 27.5-lb. 3-year-old daughter of Hengerveld De Kol, and whose sire is the great Colantha Johanna Lad. His dam is Johanna Theresa 2d, a granddaughter of Sir Johanna De Kol. She made 21.68 lbs. butter in 7 days, and 782 lbs. butter, 18,600 lbs. milk in 1 year. Moreover she's a show cow,—took first as a 4-year-old at the 1911 National Dairy Show. This youngster, just a little over 6 months old, is backed by short and long time records. Individually he's a dandy, nearly half white, just the kind you've been looking for. Other young bulls by the same sire and from A. R. O. dams for sale. Write
WAYSIDE STOCK FARMS, A. L. Williams, Est., O. A. Williams, Exec. Fond du Lac, Wisconsin.

WEST SALEM STOCK FARM We offer Registered Holsteins and Poland Chinas for sale; 30 choice milk cows, three to eight years old, in calf to our Junior herd sire, Sir Aaltje Pontiac Hengerveld, a 33.68-lb. bull, and one of the best individuals in the state. He was Jr. Champion at our Interstate fair. 25 heifers and 12 bulls, three to eighteen months. These are sired by King Segis Pontiac Polkadot 8th. Well grown and nicely marked. This stock is priced to sell in single or car lots. Also offer breeding stock, Wisconsin's greatest herd of Big Type Poland Chinas. Come and see our stock, or write us for just what you want in Holsteins or Polands. We can please you. Farm located right in City Limits.
J. D. McDONALD, WEST SALEM, WISCONSIN.

A. R. O. Holstein
In order to make room in our barns we must sell a number of cows and heifers that are backed by large official milk and butter records. They are bred to
WISCONSIN STAR STOCK FARMS,

Cows and Heifers
our great herd sire, King Korndyke Veeman, whose two nearest dams average over 37 lbs. butter in 7 days. Write for particulars or come to
ED. M. SCHULTZ, Hartford, Wis.

HIGH GRADE HOLSTEIN
Calves, either sex, from heavy producers, well marked, 4 to 6 weeks olds, 15-16ths pure. $25 each, crated and shipped to your station. Express and all charges paid here.
Highland View Place, - Whitewater, Wis.

FOR SALE—REGISTERED HOLSTEIN BULL We still have one dark colored bull about eleven months old, well grown and a splendid individual, show ring type. His two nearest dams average 25 lbs. of butter for seven days, and 700 lbs. for the year, one of them as a two-yr.-old who gave 16,000, lbs. of milk in a year. They will be tested again at their next freshening and we feel very sure that both dams will make at least 30 lbs. He is sired by a grandson of the great King of the Black And Whites. Will make a great bull for somebody. Price $250.00—decidedly reasonable quality, breeding and records considered. Address:
Elm Leaf Stock Farm, Bear Creek, Wisconsin.
James McKone, Proprietor. William Lucia, Mgr.

TWO DANDY ORMSBY BULLS
No. 1 born Feb. 25, 1918. Dam a 16.85-lb. 2-yr.-old daughter of a 35.43-lb. sire. Second dam 21.80 lbs. butter. Bull marked about ⅔ white. Extra good individual. Price $200, delivered. No. 2 born Mar. 2, 1918. Dam has a 4-yr.-old record of 21.80 lbs. butter, one of the best yearly producers in the herd. Bull is about evenly marked, a good individual. Price $150, delivered. Both of these bulls are sired by my 29-lb. Ormsby bull. For further particulars address. A. M. Anderson, Whitewater, Wis.

Holstein Bull Calves

W. G. Marshall, Proprietor. Whitewater, Wis.

A Word from the Publishers of Hoard's Dairyman

FORT ATKINSON, WISCONSIN

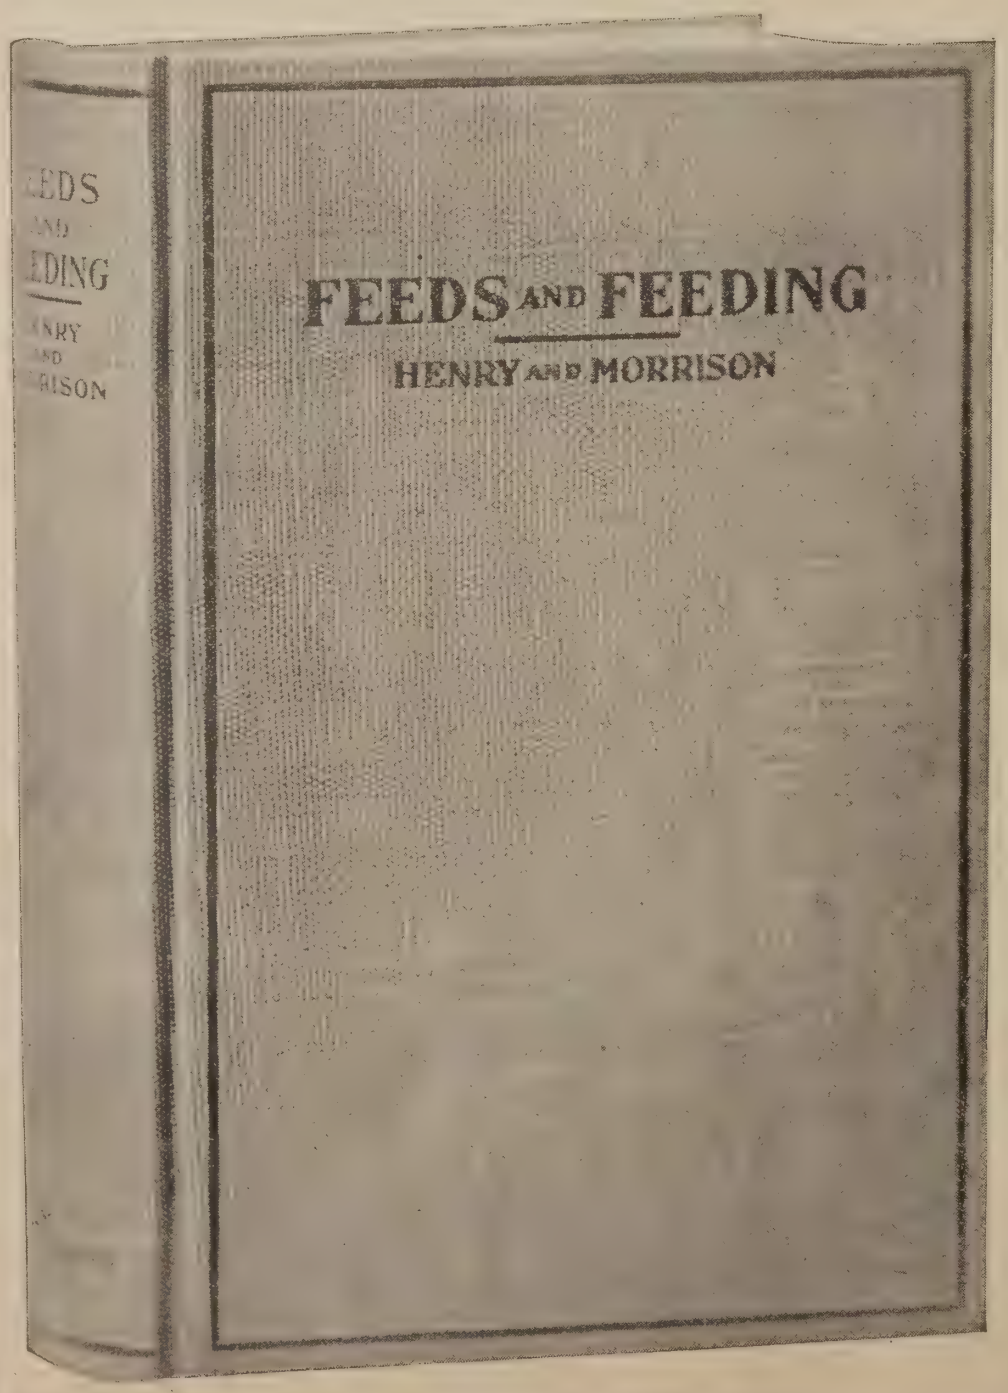
We wish it might be possible to persuade every reader of our paper to "take us up" on the offer we are making. Not alone for the extra subscriptions it would bring us—welcome as they would be! But, because we feel that every one of our readers ought—this winter—to have a copy of Henry and Morrison's wonderful book "Feeds and Feeding".

How About You, Mr. Reader?

Your milk, butter, poultry, hogs, beef—everything you sell—is today bringing a good price. You are **taking in** more money than you ever did. But are you "getting ahead" any faster? Or are you paying it right out in feed bills?

Are you **sure** you are feeding your cows the very cheapest and best ration that will keep up their milk flow and keep them healthy and thrifty?

Are you **sure** you are feeding your other stock (hogs, horses, etc.) as economically as possible?



Don't guess! Not this winter!

If there ever was or ever will be a time when it would pay you in dollars and cents to look into the whys and wherefores of the feeding business—to find out what science and practical experience have discovered about the feeding of dairy cows, hogs, horses, etc.—that time is **now!**

"Feeds and Feeding" is a 691-page volume. It represents the life work of many men. It was first written and published by W. A. Henry, formerly Dean of the Wisconsin College of Agriculture. He devoted the best of his years to gathering, testing and putting into usable form all that men have ever learned about the feeds for, and the feeding of domestic animals. And the best of it all, is that the book is perfectly indexed. Within a few minutes time—and no trouble at all—you can find out **all** about any problem in feeding.

In times like these, the wealth of information this book contains, and the fact that anyone who reads the English language can understand and use that information, makes Henry and Morrison's "Feeds and Feeding" almost priceless.

Get a copy—**now**—of "Feeds and Feeding". Plan to spend a few minutes during each of these long winter evenings studying it. "Square up" **your** feeding practices with what you learn. And we'll promise you that the "high cost of feeds" will be less of a "bug-a-boo" to you than it is now!

OUR OFFER

The price of this book is $2.50. You can't **buy** a copy anywhere for less than that. But we will send you a copy—without any charge, and postage paid—if you will do us a little favor that will take very little of your time. **Send us just four yearly subscriptions to HOARD'S DAIRYMAN at $1.00 each.** They may be either new or renewal subscriptions—and your own renewal may be included in the club. But, your own renewal does not count unless accompanied by three others.

Here's a real chance to put this encyclopedia of feeding on your reading table—without cost—and at the same time to give a few of your neighbors a "lift" along the road to bigger dairy profits!

USE THIS COUPON

Or—if you don't like to cut up your copy of HOARD'S DAIRYMAN—write about the same thing in a letter—

HOARD'S DAIRYMAN,
Fort Atkinson, Wis.

Enclosed is remittance of $4.00. Send me a copy of the latest edition of "Feeds and Feeding".

FEED THY COWS

A. C. PALMER, Indiana

ere to take a text from which alk to a gathering of dairymen, ld paraphrase the twenty-first r of the Gospel according to hn, the 15th, 16th, and 17th . There Jesus was speaking to asking, as you remember, "Si- on of Jonas, lovest thou me?" on Peter's reply, insisting that l, Jesus urged and impressed him the single ce, "Feed my .

d thy cows! e-tenths of the ien are at fault t their cows are ed, and no small tage have cows ir farms that are ly starving. To e extent, this is an ignorance of properties and as, for instance, ng that corn fod- or corn silage, and bran make a ed ration. But the common rea- nd I say it to the of the majority rymen—is plain, ight stinginess he creature that pay with high in- every cent spent ner proper nour- t.

earliest recollec- f this stinginess hen I was a boy, g the family cow. ran and linseed s a basis, I had up what I t was a balanced for Old Speck. s responding to in a most encouraging way. ening I was milking, and the as eating her regular meal, an uncle came up. A single at the big feed of what he t was plain bran threw to exclamations against my gance and wastefulness. And he learned there was linseed ixed in it, too, he nearly ex- But when I showed him the llons of milk I got and told him had been getting it while his vere averaging 50% less, he to learn how much we would or the cow! As though she do any better for him than his cows on the same feed they etting.

that is just one trouble with so f us. We get word of a fine cow and figure that all we have to do to get a milk production of her average in our herd is to buy her and some more like her. We forget that 75% of a cow's production depends upon her feed and care, and not over 25% upon her ancestors.

Perhaps I was a little harsh in saying this fault of short feeding is due to stinginess. It is hardly that. Rather, I would call it a lack of nerve. The poor feeder cannot, to save him, stand to dish out more than the small amount he has been feeding for years. I have actually known farmers who would take the trouble to figure out a system of rationing for their cows, and really feed them accordingly for a few days, but when there was no immediate gushing forth of increased volume, they simply had not the nerve to continue, but dropped back to the old methods.

I think the greatest good that could be done us ordinary dairymen would be a visit to some breeder who is conducting a 30-day milk test. We could then see the enormous quantities of rich feed a dairy cow can consume without her losing her hair and hoofs through foundering. We would come back feeling a little ashamed of the pitiful portions we had been measuring out, and then watching the milk scale for an increase.

You cannot eat your cake and have it too. It's a hard thing to get rooted entirely out of our minds, but we can't get something for nothing from a milk cow any more than we can from a confidence man. The cow is a milk-producing machine, and she is not a magician—she can't eat a corn nubbin and produce a bucketful of milk; she can't make rich, warm milk out of wind and ice water. We have got to give her the raw material or we can't get the finished product.

Only a few months ago we read of an Iowa dairyman picking up at a local stock yards a common grade cow that was producing less than 150 lbs. of butterfat a year, and was slated for roasts and soup bones. He took her home, gave her proper care and feed, and in a year or so that same cow, labeled a failure by her owner, was one of the local record-breakers. And I am willing to wager that there are scattered through the hills and valleys of my own county, or any other county in the United States, many a high-producing cow that is kept down to a miserable production because of the lack of nerve, or the ignorance of her owner.

The trouble is that it takes time to raise the standard of a herd through proper care. One can't start today with even a perfect ration and expect a big increase next week, or next month. Many cows are run-down; they have been underfed and their systems are deranged. It takes time to get them straightened out and nature working right. I believe I am safe in saying that it takes from six months to a year to notice the real results that will come from proper feeding of a cow that has been undernourished for years. These things can't be done in days.

And, strange though it sounds, it is a fact that the greater part of the underfeeding on the part of the farmer with pasture comes during the summer months. Just consider: The practice is to turn the herd on to pasture about the middle of May. Then along about June the pasture is good and the cows come in with their sides bulging. Their milk flow picks up. We look at the milk pails and the paunches of the cows stuffed with new grass and say, "Well, there's no need of foundering them. We'll just leave off the bran from now on." It's left off and it stays off all through the summer; all through the dry August weeks when grass gets short and clear on until frost drives the cows into the barn for a feed of grain.

Now, what is grass anyway? What sort of a magic food is it that it should be considered a perfect feed for dairy cows? The answer is that grass is practically hay with water in it. And what farmer that even pretends to keep cows would think of feeding his stock on moist hay all winter? Yet that is all the feed the poor cow usually gets throughout the summer.

I have heard the argument raised that since grass is the natural food for cows, then when there is plenty of it, that is all she needs. The answer is that since the production of milk in larger quantity than is necessary for her young is an unnatural function of the cow, unnatural methods must be adopted to produce it. Green grass will furnish the nutrition for a cow's body maintenance, and its appetizing and stimulating qualities will encourage milk production. But all too often the stimulating quality

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Holstein Association Service

It is the desire of the Holstein Association to be of service to all dairymen. Let us help you in the re-organization of your dairy herd to secure greater net returns than ever before. During this winter it is best to attend agricultural meetings whenever possible and gain from them help which will result in: First, finding out the individual production of each cow, and her total cost of production together with her gross receipts, then her net value to you and your herd. Second, learn how to better feed and care for the remaining good cows in your herd. Third, become familiar with plans of how to secure the services of a good pure-bred sire through co-operation with your neighbors. Fourth, secure information as how best to market your milk products and surplus stock, through co-operative effort. Fifth, learn the value of pure-bred dairy cattle and resolve to begin now to found a pure-bred herd.

Dairy farmers unable to attend meetings as suggested above are urged to communicate with the Extension Department of the Holstein-Friesian Association of America at Brattleboro, Vermont, and assistance will be given in every way possible. We have educational pamphlets which help, and can assist you in getting other facts from different sources that will increase the efficiency of your herd. It is through better organization of one's own herd and dairy business first, and then by co-operation with known organizations of local, state, and national standing, that the dairyman can best prepare himself to meet the new demands during the period of readjustment.

WM. R. RIDER, Director,
Extension Service.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

A Moral in the Separator

I never see the cream, each day
Done in a separator way
That life, itself, does not present
A parallel of what is meant.
Some of us, sit around and wait
For deeds to head and consecrate.
We say: "Oh, well, the time will come
When I can help my neighbors some.
Why worry over reaching out
To help these fellows all about."

We have a selfish, thin veneer
Of charity that's mighty queer.
We skim a good deed, from the top
And sigh complacently—and stop.
No depths of charity are found;
No peaks of love and faith abound.
It's just a case of "good enough",
A sort of superficial bluff.
And we are cheating, all the while,
But do it nicely and in style.

Apply the "separator" scheme
To life and see it bring th' cream!
Get all the good in you to show.
Bring out the things you scarcely know.
Let every virtue you possess
Get busy—not a fraction less.
Efficiency in thoughts and deeds
Is what a thrifty nation needs.
And—best of all—in many ways,
You'll find this skimming process pays!

True Patriotism

A young soldier while engaged in the desperate fight at Cantigny, was found by some of his American pals at the conclusion of a particularly desperate fight, squatting in the middle of a piece of grass-covered ground. He had a little pile of hand grenades at his side and there were several enemy dead on the outskirts of the little green oasis. He had been fighting like a demon, single-handed.

"What's the idea?" asked the sergeant, running up, "why stay here—it's all over?"

"See this grass?" was the answer, pointing to a lush patch that had been put to seed by French peasants, before their retreat in the face of falling shells, "I'm keeping it for a cow back of the lines that belongs to a family I'm billeted with. It's the only pasture in forty miles."

If There Was No Milk—

What about "peaches and cream"?

How do you suppose coffee would taste?

Would you miss that dish of ice cream?

Where would the rosies in baby's cheeks go?

Milk toast has helped many an invalid.

And then there is cheese.

Milk chocolate is mighty good, isn't it?

Imagine what the pastry cook would say!

Ever try eating cereal with water?

Could father get along without his milk shake?

And then there are the blessed little calves.

Just supposin' there was no milk.

One reason why young folks leave the farm is because they think the work is so hard. Humph! When they strike the city they find there's nothing else.

"What's the idea of building your silo with a sharp edge on one side?"

"Read where any silo would help cut the feed bills in half and I wanted to make things dead sartin."

Farmer's wife (to new helper)—"We are all vegetarians here—are you?"

The helper—"I'm liberal that way, ma'am—just so it's a church, it don't make no difference to me."

98%

Of the World's Creameries use exclusively DE LAVAL CREAM SEPARATORS

That one fact alone is sufficien reason for your choice of a De Laval.

The Creameryman handles mil lions of pounds of milk and he has found out from experience that no other cream separator wil skim so clean or wear so long as the De Laval.

"Claims" don't fool the cream eryman. He goes on "perform ance". Why not you too?

Contagious Abortion of Cattle

GEORGE M. POTTER. Kansas College of Agriculture

CONTAGIOUS abortion, abortion disease, or slinking of the calf, is a disease of the first importance wherever cattle raising is an important industry. Its contagiousness was recognized by Europeans early in the eighteenth century, but the true nature of the disease remained a mystery until the development of the science of bacteriology made it possible for investigators to work out its cause and the manner in which it affected the animal body. In 1896, Doctor Bang, a Danish veterinarian, discovered the germ of abortion disease and since that time a great deal of investigation by many of the foremost scientists of the world has added to our knowledge concerning it.

Nature of Abortion Disease

This is a peculiar disease in that it seems not to affect the general health of the mother; but the germs gaining entrance to the pregnant uterus set up an inflammatory process which breaks down the attachment between mother and offspring. The latter, unable to receive either nourishment or oxygen, dies, whereupon it becomes a foreign body and must be expelled. Other organs of the body are not involved, except that the germs are frequently found in the udder where, however, no disease is produced. It is believed that the bodies of bulls and calves are not affected, but this point is still in controversy.

The disease is so chronic, requiring months for its development, and so insidious, being introduced by animals apparently normal in every respect, that it is hard for the average stockman to realize that he is dealing with disease. Mild symptoms and usually rapid recovery of the cow disarm suspicion. He believes that the loss of the calf is due to accident or improper feed and so fails to take the necessary precautions. The first few cases are usually neglected and every opportunity is given for the spread of the infection. It is only after the disease is well established that the stockman realizes the seriousness of the situation.

The complications which attend this disease are more serious than the disease itself. Retained afterbirth, barrenness, the loss of milk in dairy herds, and the lessened breeding efficiency in valuable herds are often of greater importance than the mere loss of calves. Calves may be born alive but so weakened because of the disease that they quickly die of other ailments or do not thrive.

Cause of the Disease

The primary cause of abortion disease of cattle is conceded by practically all investigators to be the abortion germ or organism called the Bacillus of Bang, from its discoverer, Doctor Bang.

Investigators have been able to produce abortion experimentally in various species of animals by inoculating them with the abortion organism, but under natural conditions the disease does not readily spread from one species to another, as from cow to mare. Very peculiarly, the same result—abortion—is produced in three different species of animals by three different organisms, there being one for the cow, another distinct germ for the mare, and still another for the ewe.

The belief is common that injuries to the mother, eating spoiled feed, drinking cold water, etc., are the cause of abortion. Space forbids a discussion of these questions, but it is sufficient to say that nature has so well provided against these accidents that they are of slight importance compared with infection as the cause of abortion. It would be foolish, however, to deny the existence of contributory causes. It is a general principle that anything which lowers the vitality of an animal contributes to the development of disease; therefore, starvation, spoiled food, accidents, or other disease, may well assist in causing the death of the offspring. Recent investigations have shown that the reproductive function has been seriously interfered with where the pregnant animals were restricted to feeds deficient in the elements necessary for growth. Calves came dead or poorly developed and weak, while calves from properly nourished cows were strong and vigorous. This feature should be most carefully investigated to ascertain to what extent our present methods of handling and feeding our breeding herds influence reproduction.

Symptoms

The act of abortion is but a symptom of the disease. The disease itself exists within the uterus, and the undeveloped calf is expelled because it can on longer live in the infected organ. For the dead calf to remain would result in its decomposition, and the life of the mother would be endangered through the absorption of poisonous products. The expulsion of the dead calf is therefore the first step in the process of healing.

The symptoms of approaching abortion are merely those preceding normal calving, and consist in the swelling of the udder, or making bag, and the swelling of the external genital organs. The swelling of the udder would be more apparent with beef cows and heifers than with cows in milk. Not infrequently the calf is expelled without any warning symptoms. Following abortion there occurs a characteristic, dirty, yellowish to brownish, flaky discharge that in turn gives place in a few days to purulent discharge, which may persist for several weeks unless proper treatment has been given. In addition, there are certain inflammatory changes present in the body of the dead calf, the membranes, and within the uterus of the cow, which can b recognized by the expert.

Abortion may occur in susceptibl cows at any period of their lives, fror first pregnancy until 15 or more year of age. It may also occur at any tim during the period of pregnancy Young animals in first pregnancy us ually abort early—at from two to fou months—while older cows may carr calves five to eight months or even t full time. In very early abortions th calf and its membranes are expelle intact. In such cases the calf is ofte not found, there are no observab symptoms, and no disturbance in th health of the cow, consequently th owner thinks the cow failed to bree Where abortion is delayed, retentic of the afterbirth is a common occu rence. Retained afterbirth and steril ty are also recognized symptoms abortion disease.

Complications

Retention of the afterbirth is pe haps the most serious feature connec ed with the disease. Not only does occur in connection with the untime birth of the calf, but in a herd whe abortion exists it is frequent ev where the calves are born at full tin

2. SUSY'S TWIN MAIDEN
3. ST. MAWES BLOSSOM
4. LUCY OF PLEASANT VIEW

FOUR JERSEYS, FULL SISTERS—ALL PRODUCERS

The accompanying illustration shows a breeding example that is worth the attention of all cattle breeders and dairymen because it points out the value of a good sire through the evidence-producing Babcock test. St. Mawes was a great sire because he was capable of getting high producing daughters, and he became known as such because his daughters fell into the hands of men who believed in the official yearly test.

St. Mawes has twenty daughters in the Register of Merit, with a yearly average of over five hundred pounds of fat. One of his daughters, St. Mawes Poppy, made three official yearly records, the highest of which was nine hundred and fifty-two pounds. The four of his daughters shown here are all out of the same dam, Susy of Forestdale, and the average production for six R. of M. records is slightly over six hundred pounds of fat. Their official records to date are as follows:

	Milk Lbs.	Fat Lbs.	Age Yrs.	Mos.
St. Mawes Susy 219991	11,583.1	692.00	5	2
Susy's Twin Maiden 262409	9,383.3	546.19	5	5
St. Mawes Blossom 229066	9,709.7	599.20	4	3
1st reentry	10,174.3	638.40	5	6
2nd reentry	11,068.7	713.84	8	10
Lucy of Pleasant View 282564	6,477.0	410.98	3	4

St. Mawes went the way of many good bulls (the beefsteak route) before he had had a chance to prove his worth, but his record may encourage other breeders to test cows in order to discover not only the best females but the proper sire. Discovering a good sire is like finding a buried treasure on the farm. —A. L. TICHANE.

College Practices Gospel of Self-help

M. W. MUTE, Illinois

WN at Carlinville, Illinois, there s a college that is developing A.). cows and, what is even better , "Advanced Registry" men and ien. This is quite an old college, ng been founded in 1837 by ion Blackburn and christened i his name, but this old college been born again through the gos- of self-help. Five years ago, un- the direction of a new president, Wm. M. Hudson, there was estab- d a new order of things and since there has been a remarkable vth because this college is filling a need.

verywhere there are colleges pro- ig for those who can afford to for the purpose of Blackburn) offer a practical :ation for young and women who) little means but hungry enough for education to work it. The fixed ges per year for n, board, and tui- are nominal and e from $100 to) plus, and this is a in the truest sense hat word, two and lf hours' work each with the hands. rough this work the hands practice oined with theory the how of things the why of things. young women are ht household ce, just as other ols, and then there at plus; they work what they have ed in the class in the college en and dining hall, l the housework is by the young en. In the same ier the young men caught agriculture then work out they have learned on the college of two hundred acres. From farm the bulk of food consumed e college commons comes.

e readers of Hoard's Dairyman be most interested in the dairy i had a humble beginning indeed. enty-five thousand dollars had spent in improving the plant and g up-to-date equipment, the were low, there was a big and how to start the dairy was blem. Money was secured to buy de Holstein cow, then a friend loaned a grade Jersey, and another friend was kind enough to call these two cows "the college herd". Nothing fits better into the general scheme of things in a self-help college than a dairy. The work comes largely in the early morning and late evening, no class conflicts with the milking job, the students have an abundance of good milk, and more profit is realized from the dairy than any other department of the farm. In the rapid growth of Carlinville a fine local outfit for milk at good prices has opened a large field for a profitable dairy.

There was the same problem in regard to barn and silo. A friend, living in the town and becoming interested in the project, said: "There's a barn on the back of my lot which I do not need and I should be glad to give it to the college if the boys will take it down and move it. Fortunately it was an old fashioned pin frame barn and the moving was quite simple. This work was done entirely by the students and furnished them many valuable lessons in farm carpentry. In the same way, friends donated the material for a solid concrete silo and the students did all the work on it under the direction of a competent supervisor. This silo is 12x36 and has been such a success that Blackburn students are all silo boosters. When it comes time to fill the silo, there is a holiday on Friday which, with Saturday, gives ample time for this and the threshing. This is a fine illustration of the value of this work with the hands. It might be possible to learn just how to fill a silo out of a book, but how much better it is to help fill one under the direction of a farm boss who knows just how it should be done. The same rule holds true about feeding the ensilage. In fact the student at Blackburn, who must needs weigh and measure the feed for each cow, and who weighs the milk and tests it for butterfat, learns much that will be of immense practical value to him later, and in addition he is all the while earning part of his education.

FILLING THE SILO AT BLACKBURN COLLEGE, ILLINOIS

LSTEIN COW, WAKEFIELD CANARY PONTIAC
in A. R. O. record as a senior two-year-old of 464 lbs. 3.1 lbs. fat in 7 days. Robert E. Murphy, feeder and

OWNED BY BLACKBURN COLLEGE, ILLINOIS

The problem of equipment in the barn was put up to Mr. William Louden and he very kindly donated that. The students put it in, more learning by doing: the *plus* element in education through the self-help plan.

And so the days have gone along till now the college has a small herd of pure-bred Holsteins of which the boys are duly proud. Quite recently two of these cows were put on official test. One was a two-year-old heifer, Wakefield Canary Pontiac, sired by King Pontiac Dione, one of the great sons of King Segis Pontiac. Just after school opened this heifer dropped a fine bull calf, sired by another great son of King Segis Pontiac, King Segis Pontiac Chicago. This heifer was presented to the college by Mr. George E. Van Hagen, owner of the Wakefield Farms and a firm believer in the gospel of self-help. As soon as she freshened she was turned over to be cared for by one of the students who came up to Blackburn from a farm and knew something about cows from practical experience, but the dairies about his home are made up largely from grades and many of them scrubs at that. In three weeks he had this two-year-old heifer milking sixty-six pounds a day. Then zeal and inexperience put the cow off her feed and she was not back in condition when the tester came, but despite that fact, she gave 464 pounds of milk and 13.1 pounds fat in the seven-day test. Not a bad record considering the age of the heifer and the boy. There is a certain community in Illinois that is going to hear much about heifers that give eight gallons of milk and make two and a half pounds of butter in a day when this boy returns home and surely this gospel of the pure-bred is going to have a new meaning in this community that heretofore has heard it only from strangers.

The other boy selected to do the feeding and milking comes from the opposite extreme, literally from the streets of Chicago. A minister, working in a mission field there, found this

HOLSTEIN COW, FLOSSMOR CANARY LADY
Has an A. R. O. record of 4[illegible]5 lbs. milk, 14.1 lbs. fat in 7 days. Jack DeMichaels, feeder and milker.
OWNED BY BLACKBURN COLLEGE, ILLINOIS

boy and had faith in him. He knew all too well where such environment leads boys, so he sent this youngster to this school out in the open country. This boy had never seen a cow milked when he came to Blackburn. He said, "When I first tried to milk I took my pail and sat down on the wrong side. The cow knowing that I needed a lesson gave it to me with her foot and the lesson was administered with some vigor." The contest between the boys was quite exciting but the city boy won out, because his cow was older, with 405 lbs. of milk and 14 lbs. fat. This should be written down as part of the great story of redemption, for when this youth goes out from school to useful and successful manhood, part of the credit must be given to the black and white cow.

And so this little red college down on the Illinois prairie is performing a real service in a sadly neglected field. Through the great principle of self-help it is training young men and women for useful citizenship and sending them out to help feed a hungry world.

Ration With Clover and Silage

Please give us a formula for a good dairy feed for Guernsey cows? We have on hand some excellent clover hay and corn silage, also barley and oats, and our own mill to grind same. What should we add to make a balanced ration?

Green Bay, Wis. H. FARM.

We would let each cow have daily about 30 lbs. of corn silage and all the clover hay she would care to consume without waste. A mixture consisting of 300 lbs. ground barley, 200 lbs. ground oats, and 200 lbs. gluten feed would supplement the roughage splendidly. We would advise feeding about 1 pound of this mixture for each 3½ to 4 lbs. of milk produced; that is, to a cow giving 24 lbs. of milk daily, or in the neighborhood of three gallons, we would feed from 7 to 8 lbs. of this mixture.

It may be said that distillers grains or brewers grains may take the place of gluten feed; or, if these can not be obtained, the gluten feed may be substituted by using 100 to 150 lbs. of oil meal or the same amount of cottonseed meal. In other words, the barley and oats will not furnish quite enough protein to supply the animal with an adequate amount for sustaining her milk flow.

Victor Jr. Churn

Practical and Complete—a Combined Churn and Butter Worker.

The Churn That Helps You to Make Firm Butter

The **Victor Junior** Churn puts butter making on the farm on a level with creamery butter making. It keeps the temperature down much better than the ordinary churn both during the churning and the butter working.

The mechanism of the churn is such that it will not only churn quickly but will get all of the butter. It also preserves the butter from dust and flies because when the churning is done, the butter can be salted and worked right in the churn. It does not have to be removed until finished.

To get the best butter, the temperature of cream for churning should be from 50° to 60° F. according to the density of the cream. A rich or dense cream requires a lower temperature than a thin cream. Having the cream at the right temperature to start with counts much in producing firm butter of good appearance.

The **Victor Jr.** will do the rest. The drum of the churn is built of heavy, well seasoned lumber. Under average conditions the temperature in the churn should not rise more than a few degrees during the churning and working process. The rolls work the butter thoroughly. It comes out with a good grain and firm.

We make and sell more churns for creamery use than all the other concerns combined so you can depend on our recommendation of the Victor Jr. as the ideal farm churn. It is covered with our iron clad Guarantee.

Full information in our Dairy Supply Catalogue.

Dairymen's League of New York

H. H. LYON, NEW YORK

A REQUEST is at hand for information relative to the Dairymen's League of New York. Considerable has been published about this but the League has become so strong and is probably the largest dairymen's organization in the world, so that it may be best to repeat some of the facts relative to it. All told, it is a long story and the organization has been long in building, especially if we take into consideration the various organizations that preceded it and which led up to its formation. Farmers' organizations come from long continued effort and almost invariably after failures, sometimes many of them.

Without looking up dates it must be a dozen years or more since the organization in the five states that supply New York City with milk had a five states' organization that was thought to be strong enough to bring dealers to terms. To my mind it was mismanaged, and many believe dishonestly managed, and when a strike was ordered it failed. It made some people think, however, and after a time the Bordens undertook, I think honestly, to increase the price of milk to dairymen. It is true that they had a big bump of compassion for themselves in making the prices, but in it all they were not followed by other dealers, they lost trade and had to go back to the old plan. I think other dealers would have been glad to pay more and get more but they feared the loss of trade and the attempt went down.

Matters drifted for a while, but immediately after the failure of the Five States' Association certain granges took up the work and from these the League was formed. Considering what was to be done at the start, the plan of the League and its officers were about as good as could be expected. The officers appear to have been honest from the start, which is an all-important item. It was thought that the officers were not as efficient as should be, but of this I am not certain considering what was to be done at that time. Slow growth seemed to be the only thing, and this it had. The League kept growing slowly for a number of years. Once it was thought that a strike ought to be ordered, but the president of the League thought it inopportune and the project was omitted. People commenced to distrust the League and increase of membership became slower. It reached a point where it hardly supported itself. Officers became anxious. Farmers were coming to be suspicious. Something must be done. Mr. Manning, the secretary, took up the matter with several parties. I well remember when it was talked over with Professor Tuck of the College of Agriculture. Mr. Thomson, then not an officer but since has been the vice-president, was taken into the council as was Mr. Dillon and others. A new campaign was organized and new members secured to quite an extent.

It was now 1916. Activity became the watchword. Many new members came in and it seemed now to be the best time to test titles with the dealers. There were those who felt that a general strike would not be successful for they thought farmers would not stay by such a movement. Among these was Mr. Gerow, who had been president since the start of the League. He was called an obstructionist and even pronounced dishonest by some. I do not believe this but that he actually thought it unwise to launch a movement at that time.

Now before going into the events of 1916, I want to mention something of the plan of organization of th League. In many ways the plan i about the only one that can be ex pected to be successful. Any such or ganization must be properly finance That is the thing of first importanc It is true that many organization have been launched with a strong f nancial foundation and then worke simply to get the money into th hands of a few and then wrecked. I is first important that there shall b honest hands hold of the affair, eve if not the brightest. Brightness is r disadvantage if honest. These thr are important, honesty, sound fina cial plan, and good executive abilit The League had a fair share these. The plan was to charge ea farmer twenty-five cents a cow f membership when joining and no du afterwards except a commission f selling the milk. This membersh fee paid expenses for several yea when the League was in the form tive period, but early in 1916 fun became short.

Here seemed to be the critical tin Good men took hold of the situati and organization advanced. A gene plan for asking an advance in t price of milk was formulated and September it began to look as thou something would happen. Mr. H. Kershaw, of my own county of C nango, became one of the most act of supporters and assisted materia in organization. He invited Gerow to come to our county speak. As already stated, Mr. Ge felt that a better time could found than that moment, but events proved, he was mistaken. attitude angered some and a m ment was instituted to substitute other president. This was succes and Mr. Brill was selected. again a man was mistaken. Mr. favored the strike if necessary bu had plans of his own which did meet the approval of others. Instea co-operating in the difficult situa he seems to have obstructed, over-ruled by the directorate w went ahead and asked the price set the conditions. Many men parts to play in those eventful of late September and early Oct There were many factors and if than one or two of them had fa the result might have been diffe So evenly divided were the f that possibly one failure might lost us the day. Every man played an honest part in the gram ought to have credit. The decision, however, depended on farmers and they stayed by the and the day was won.

When the test came the dire simply asked a fair price, unde conditions. They did not ask full or any profits. They set the were refused, and farmers asked and urged to withhold the until prices and conditions wer justed. One of the important tions was that dealers should nize the League and deal with it organization. This was necessar any attempt to deal locally by a ing the price and leave others t for themselves would have been to organization. This caused dissatisfaction, for there were ers and many business men in who wanted to see the affair and advised the acceptance of regardless of organization. It in my own town. Even the b who is supposed to be one to ful ligations and promises, advised abandon the League as an or tion and sell to the dealers local like others, was looking to the

y interests of the towns folks or business interests in the village. der the influence of business men failed to look ahead and see what ıld be the effect in years to come, n to the business interests of the n, to say nothing of the interests the local farmers. It was so in ny places but not in all. Many iness men saw the final effect of h a course and stood with the mers in relation to organization.

Iere is a point that I want to phasize. It is necessary that we ow the directions of the organi- ion, sometimes when it is mistak- It may be necessary to observe di- tions when an error of a clerical ure is made because we do not w that such an error has been le. We had an experience of that t last summer. It cost us some ney, a lot of worry, and much hard k. The office made an error. We yed directions. We got into trou- over it. In the end we came out better for it. We did not get mad h the office manager but took the sequences. The result is that we have a fine creamery of our own, ause we were forced into buying . It is much better that we have nd we would not have it yet if no take had been made and we had found ourselves practically at the cy of the dealer, who was dis- ed to take advantage of the situa- ı and expected to force us to our es and make our local league look than thirty cents. It cost us twen- ive thousand dollars nearly, but ry man who stood up straight is pleased and proud of the achieve- ıt.

t is appropriate to say that any anization must have the loyal sup- t of the members. To get this, est and conservative leaders are ded. Have a definite plan and be e that the need is clear. It must be and of considerable importance. enthusiasm can take the place of eal issue, a real need. We had a vance and found a remedy. We e not achieved all that is neces- y. One of the essential things is the smoothing out of rough es. There is still a great deal of k to be done. Greater confidence some features needs to be earned. re is need of a financial system t will be plain to all and an ac- ıting that shall inspire greater idence, or at least relieve any icion. Local people might well be n into confidence still more in or- to strengthen confidence in the gue. There is not so much criti- ı but much wonderment. Things ht to be cleared up a little better. nnecticut Boosts Calf Clubs

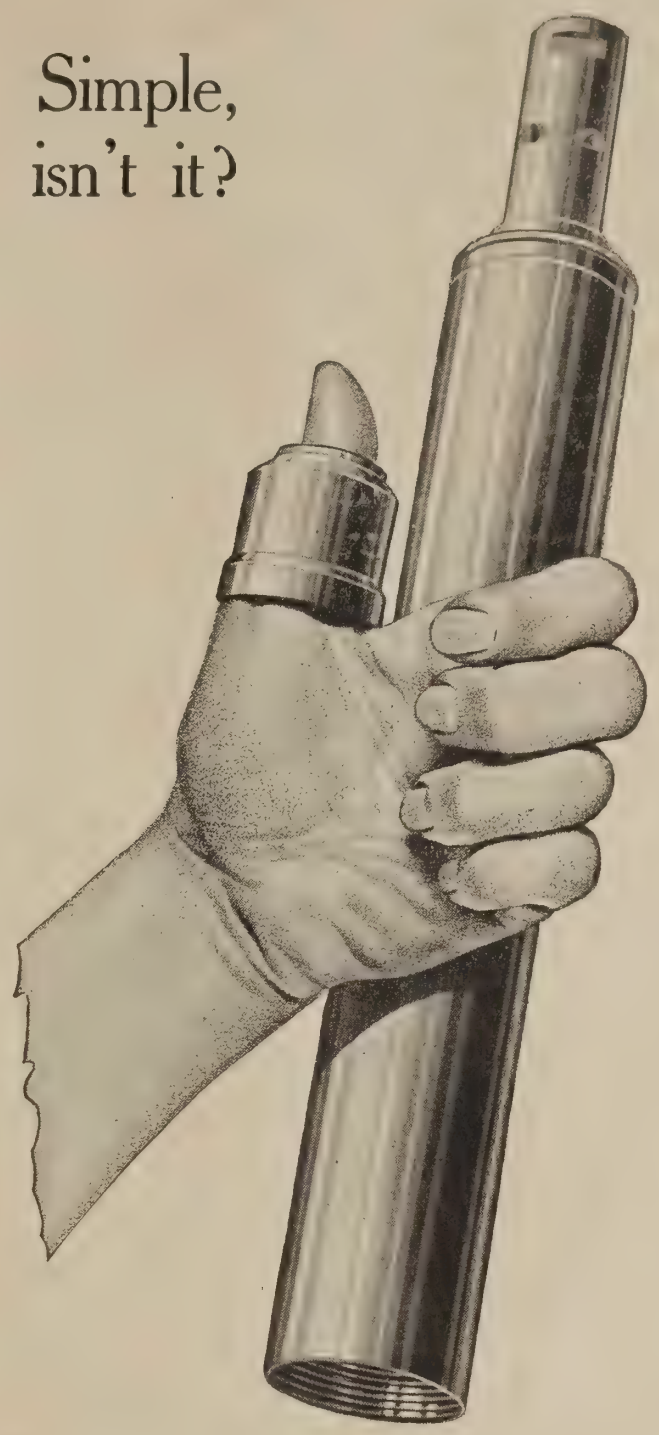
confident are two of Connecticut's ng Holstein men in the fact that y benefits will be the outcome of boys' and girls' calf club work, they have contributed a prize to be awarded the Fairfield County boy or girl who raises the best grade heifer calf under club conditions. John T. Hunt offers a pure-bred heifer calf from one of his cows having a semi-official record of at least 16,000 lbs. of milk per year. It represents the best blood in his herd. The value of this prize is still further increased by the offer of Richard E. Dodge for the free service to the prize heifer of his famous herd bull, Maple Crest Farsedo Butter Boy.

The prize itself is of secondary importance to the interest which leading breeders in this state are now showing in calf club work. The opinion that permanent improvement of the dairy industry, as well as other farm issues, must get the strongest impetus from the careful training of boys and girls for better farming, is steadily increasing.

All members of the Fairfield County Calf Club must keep records of their work and file a report with their County Farm Bureau. It is expected that the youngsters who try for the prize heifer will, during the next two or three years, bring out some interesting facts which will be of benefit to the community.—LEONARD M. JOHNSON, County Club Leader.

Ration With Cottonseed Hulls and Cottonseed Meal

How much cottonseed meal should be fed to grade Holsteins and grade Guernseys? We have cottonseed hulls and pasture for roughage. We also have velvet beans soaked 12 hours before feeding; also oatfalfa consisting of alfalfa, oats, corn, and molasses.



Warrenton, Ga. H. A. W.

The amount of feed, both roughage and meal, to use depends upon the pasture. We presume that from now on until February or the first of March there will not be a great deal of pasture, and in suggesting a system of feeding, we will not allow very much for what the pasture will furnish.

We would let the cows have all the cottonseed hulls they would care to consume. We do not value this roughage very highly. We only recommend it when there is an absence of more nutritious roughage. We believe that in the South where there are such splendid opportunities for growing cowpeas, soy beans, and alfalfa, dairymen should provide themselves with that kind of roughage, for they are not only more nutritious but they supply a large amount of protein, so highly desirable for cows giving milk.

A mixture to supplement the cottonseed hulls may consist of 300 lbs. of the mixture of alfalfa, oats, and molasses, 300 lbs. velvet beans, soaked 24 hours before feeding, and 100 to 150 lbs. of cottonseed meal. Feed about 1 pound of this mixture for each 8 to 3½ lbs. of milk produced. With good legume hay, we would not advise feeding as much meal, but since the cottonseed hulls do not furnish a great deal of nutrients, it is necessary, if the cow's milk flow is to be kept up, to use a liberal allowance of the concentrates.

As a rule, we would not advise feeding more than 1 to 2 lbs. of cottonseed meal daily. We recognize that in the South it is not uncommon to feed all the cottonseed hulls an animal will consume and then 7, 8, or 9 lbs. of cottonseed meal. The animals seem to do fairly well on it, but we are satisfied they will do much better when fed less cottonseed meal. In the North, one to two pounds a day is the common allowance, and animals not accustomed to eating cottonseed meal would not do very well if fed as much as is the practice in some instances in the South.

Dependable, Economical Power Under All Conditions

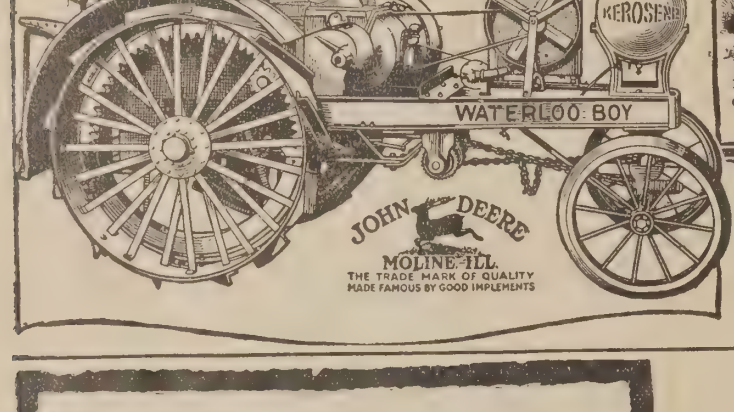
WATERLOO BOY

ORIGINAL KEROSENE TRACTOR

Whether your soil is hardpan, black-wax, timothy sod, gumbo or just loam, the Waterloo Boy Kerosene Burning Tractor has the necessary power to farm it. Our thousands of satisfied users all over the United States have given this tractor rigid tryouts in every possible soil condition, and the Waterloo Boy has always pulled through with a record.

Perfect Lubrication Necessary to Efficient Work and Long Life

The teeth of friction get busy quicker on a tractor than on other machines, because of the trying circumstances under which it must work. No matter how well your machine is built, it can not do good work unless the lubricating system is right.



The Waterloo Boy is equipped with the well known circulating splash and pump system of lubrication, which is employed on high class automobiles generally. This constantly maintains a substantial oil flow between all friction points. With dust-proof gears and bearings, it prevents wear, increases power, keeps down repair expense, insures smooth, steady work.

High quality material and workmanship throughout guaranteed.

Write us for illustrated catalog showing many photographic views with letters from users, also details of construction.

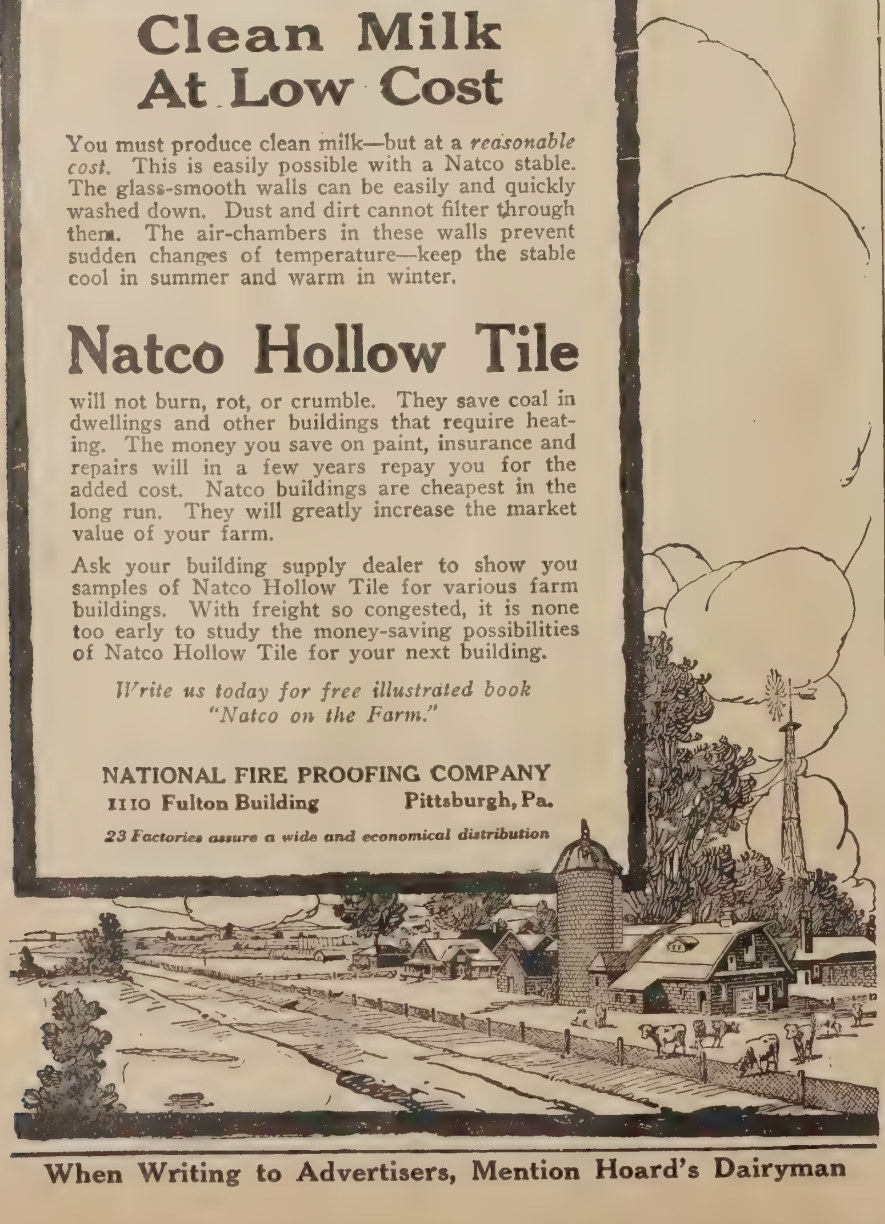
Clean Milk At Low Cost

You must produce clean milk—but at a *reasonable cost*. This is easily possible with a Natco stable. The glass-smooth walls can be easily and quickly washed down. Dust and dirt cannot filter through them. The air-chambers in these walls prevent sudden changes of temperature—keep the stable cool in summer and warm in winter.

Natco Hollow Tile



will not burn, rot, or crumble. They save coal in dwellings and other buildings that require heating. The money you save on paint, insurance and repairs will in a few years repay you for the added cost. Natco buildings are cheapest in the long run. They will greatly increase the market value of your farm.

Ask your building supply dealer to show you samples of Natco Hollow Tile for various farm buildings. With freight so congested, it is none too early to study the money-saving possibilities of Natco Hollow Tile for your next building.

Write us today for free illustrated book "Natco on the Farm."

Association Notes

Polk County, Wis.:—This association was organized the first of August but as yet no noticeable changes have been made in herd management. The creamery paid 69 cents per pound fat in November. Oil meal cost $3.25 per cwt.; oats, $40 per ton; bran, $34; timothy, $24; silage $4; clover hay, $24.

Fort Atkinson, Wis.:—Several pure-bred sires were bought during the month. Two unprofitable cows went to the butcher. Every member in this association has one or two silos. In November market milk sold for $3.70 per cwt. The average test required was 3.5% and 4 cents were paid for each point above. Milk retailed for 12 cents per quart and butter 70 cents per pound. Feed prices: Bran, $38 per ton; silage, $6; oil meal, $52; corn, $38; hay, $25 to $35.

Orange, Va.:—In Washington, D. C., market milk sold for $4.65 per cwt., and 40 cents per gallon. The average test required was 3.5%, 4 cents being paid for each point above. The creamery paid $1.00 per pound fat.

Hebron, Wis.:—Three unprofitable cows were sold for beef during the month: One pure-bred bull was bought to head a grade herd. In November market milk sold for $3.[illegible] and $3.68 by test per cwt., and $3.[illegible] flat rate. The average test requir[illegible] was 3.5% and for each point abo[illegible] 4 cents were paid.

Middlesex—Somerset, N. J.—"I wi[illegible] to call attention to an error in pu[illegible]lishing the report of the Novemb[illegible] test of this association appearing your issue of Dec. 13. This shows t[illegible] fat production of high cow of For[illegible]gate Farms as 33.4 lbs., which was t[illegible] average fat production of the her[illegible] the production of their high cow [illegible]ing 68.9 lbs."—J. G. K. Duer, test[illegible]

St. Joseph County, Michigan—M[illegible] of the members are beginning on w[illegible]ter feed now and as there are mo[illegible] cows coming in, milk producti[illegible] shows an increase. One member h[illegible] his herd on official test and anoth[illegible] expects to start soon. A farmers' c[illegible] operative shipping association is [illegible]ing formed at Three Rivers that w[illegible] help farmers of this section conside[illegible]bly. In November market milk s[illegible] for $3.50 per cwt. The cream[illegible] paid 59 cents per pound fat. Milk [illegible] tailed for 12 cents per quart and b[illegible] ter 62 cents per pound. Feed pric[illegible] Silage, $10 to $12; alfalfa hay, $[illegible] to $30; mixed hay, $20 to $30; c[illegible] tonseed meal, $62; oil meal, $58; c[illegible] flakes, $56; bran, $35; gluten, $54

Lime Made Clover Grow

HOARD'S DAIRYMAN:—We don't grow alfalfa. We tried it 6 years ago and it was a failure. We grow clover instead. This is our story:

We have been reading Hoard's Dairyman for a good many years and I guess every column of alfalfa growing interested us more than anything else for we took a whole season almost to get a field ready. We limed, harrowed down, inoculated, and sowed just as per Hoard's Dairyman and by August 15 of that year we had a good stand of alfalfa.

The winter was hard on the alfalfa but it pulled through fairly well and it began to grow fast in the spring. Soon after the first of June we harvested it and it made about a ton to the acre. Then something went wrong. The weeds began to grow, the alfalfa got yellow, and a county agent said that probably we had forgotten to harrow in the soil for inoculation after sundown and that the sunshine had killed the "bugs".

I remembered that was right. We did get a lot of soil from a sweet-clovered hillside and I had hauled back about a dozen stalks of sweet clover and scattered them over the ground. Our neighbor coming across the field the next day noticed them and picked them all up and threw them into the woods. He told us later that they were a dangerous weed and he didn't want to get them into his field from ours. The next season I went over to the woods and there was a patch of sweet clover 10 feet square and about 8 feet high. I guess the bugs on that bunch of clover was not hit by the sunshine.

We mowed the weeds down instead of the second crop of alfalfa and noticed then that volunteer clo[illegible] was starting and in fact was cro[illegible]ing out the alfalfa. By fall we [illegible] an excellent stand of clover plowed it down for corn the foll[illegible]ing spring.

For ten years previous we ne[illegible] could get a stand of clover and [illegible] to find that clover was really cro[illegible]ing out alfalfa was too much to b[illegible] But anyhow we had a hankering [illegible] the lime had something to do wit[illegible] and since that time have limed al[illegible] 60 acres, and will repeat every [illegible] years. We have been using abou[illegible] ton of hydrated lime but expect to[illegible] 2 tons of ground limestone hereaf[illegible]

Our stands of clover are now [illegible] over the entire farm and we h[illegible] adopted a rotation of corn, wh[illegible] and clover which of course would [illegible] allow alfalfa to fit in very ea[illegible] While we do not get as much [illegible] from an acre of clover as one w[illegible] from an acre of alfalfa, we often [illegible] two tons for the first crop and s[illegible] times a ton from the second crop [illegible] is not allowed to produce seed.

When the wheat is taken of[illegible] July we have a good growth of [illegible]ver that we frequently pasture [illegible] about three months in the fall. [illegible]ing the next season it may be [illegible]tured again or may be made [illegible] hay. Anyway we aim to get [illegible] 30 to 40 pounds of pork from an [illegible] after wheat harvest. We could [illegible] pasture alfalfa in this manner.

Some day we may become [illegible] specialized and grow some alfalfa [illegible] now we grow clover instead. Th[illegible] our story.

Ohio. CLARENCE M. BAK[illegible]

What is a Good Cow Worth

HOARD'S DAIRYMAN:—"I can not ord to allow you to take your ice from my herd for double that ce. You would take away the best t of my herd and leave me no ther ahead than I was several rs ago. With the present high ces of butterfat, they are worth re to me than to you." Such was answer of a Wisconsin dairy mer to a certain out-of-state ry cattle buyer when he remarked t he would like to select several -year-old heifers and three-year- cows for an average price of $125, s he had just done at a nearby ghbors.

hat man probably placed his price high as far as their actual worth producers was concerned, but as as their actual value to him in lding up his herd is concerned, he omized the opinion of every good sconsin dairy cattle owner.

n the other man's herd where the ice animals were selected there e 18 or 20 animals. Ten or lve of these were well marked by use of a pure-bred Holstein sire, the remainder either had black , were too dark in color, or had markings. By taking out six of best animals in the herd, which buyer was allowed to do, it can lily be seen what was left for that er.

ortunately, men who are interest- nough to build up good herds by use of pure-bred bulls are usual- ar-sighted enough that they will part with their best animals re- iless of the attractiveness of es offered. Nevertheless, out of n herds visited in one day the ers allowed the buyer to prac- lly have his own way.

hen a herd is overstocked, and and ready cash is scarce, it s on first thought to be the prof- le thing to sell the animals which bring the highest prices; but n herd building is considered as ow, careful process of breeding selection, the only logical and ral thing to do is to sell the culls he butcher for lower prices and the herd improving until it hes a level where good ones can old without interfering with the ity of the herd and its produc- By such practices a point can eached where the poorest animals ie herd would be equally as good he best animals that are being today.

a man sells the best part of his and finds what a mistake he has when it is too late, he should blame the buyer. He should re- ber that that buyer was under ation to other farmers to buy est for the lowest price, and it is o the owner to analyze his own tions and study his own herd so ughly that he will know what als to sell and what price to for them. In this way, and only is way, can he ever expect to as- le a herd that will return a good, antial profit.

sconsin. E. L. LIDDLE.

vesting Ice Pays Dividends

ARD'S DAIRYMAN:—Five dollars per cow annually, by providing r thorough cream cooling, can be ed by farmers in the natural ice n of the country. There usually period of leisure in the winter when any farmer can arrange te advantage of this paying in- ent. It is estimated that the sion of 1,000 pounds of ice per sufficient to cool the cream dur- he year besides furnishing ice ther incidental purposes about me.

ifteen-cow dairy would require about eight tons ice costing about one dollar per ton to harvest. The proper use of this ice in producing higher quality cream, for which the creamery will pay a premium, will add practically $85 to the annual income from fifteen average cows, or $5 net for each cow.

Ice Helps Quality

The immediate cooling of cream to 50°F. or less will keep it sweet usually a day longer than cream not sufficiently cooled. If cold spring water be abundant very little ice will be required. Usually in the hotter part of the season the supply of spring water may become so diminished that its temperature rises to such a point that proper cooling can not be accomplished without the aid of ice.

Quality is the watchword of the progressive creamery. So keenly do the creameries appreciate quality of their raw product that they are willing to pay from three to five cents per pound more for the butterfat in clean sweet cream than they will offer for sour cream fat. They will pay this difference because they are able to get more on the market for the product made from well cared for cream.

Good quality sweet cream makes a high scoring and fancy piece of butter. Butter is now sold according to its score. The higher the score the better is the price. The more the creamery can get for its butter the more is it able to return to the producer for his butterfat. It follows that if the creamery is to pay good prices, it is necessary for the patrons of that creamery to deliver the highest quality cream.

Ice Means Fewer Deliveries

Many farmers who do not have cold springs or ice on their farms are obliged to deliver their cream daily in warm weather in order to have their cream sweet and thus command the premium price. By proper cooling in clean, scalded utensils to at least 50° F. this same producer could keep his cream sweet long enough that only three, instead of six, weekly deliveries would turn the trick. A little ice for thorough cooling in this way saves several hours of valuable time needlessly spent taking the cream to the creamery when the time can be more profitably spent about the farm in the busy growing and harvesting seasons.

High Prices Demand Quality

As prices advance the trade becomes more particular about the quality of the goods. It therefore is the producer's problem to do his bit in maintaining high prices by supplying only the very best raw product which is the prime essential in the manufacture of a fancy article for which there is ever a good demand.

By observing absolute cleanliness about the dairy equipment and personnel, by keeping profitable cows, and especially by thoroughly cooling each batch of cream, is the producer really doing his duty in making possible the supply of the best dairy goods to an appreciative demand.

A little ice house, some sawdust or hay, a few loads of nature's ice, and the progressive dairyman has made an investment that gives his community a reputation and his pocket book a paid tax receipt.

Vermont. A. D. LYNCH.

The farmers of Winneshiek County, Iowa, recently made a very liberal contribution to the American Red Cross. The farmers of this county gave 2,250 of the finest hogs ever raised in Iowa. It made a full train of 30 stock cars, which went to Chicago as a Red Cross Special. Here again the farmers have shown that they have done their full share in support of the war.

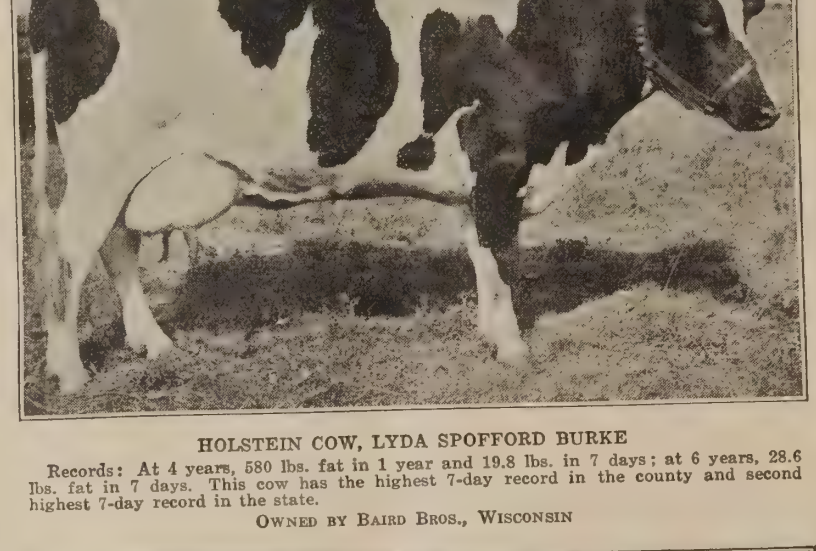
Southwestern Dairy Notes

HOARD'S DAIRYMAN:—Dairy interests of Kansas, Missouri, Oklahoma, Nebraska, and other southwestern states effected a considerable saving in feed bills the last two months. Besides the excellent grass made possible by liberal rains and a plentiful supply of sunshine, wheat attained such remarkable growth as to afford excellent grazing. Fields of the golden grain were about as green in November as in early May and June, and throughout the territory dairy herds and other stock relished the pasturage.

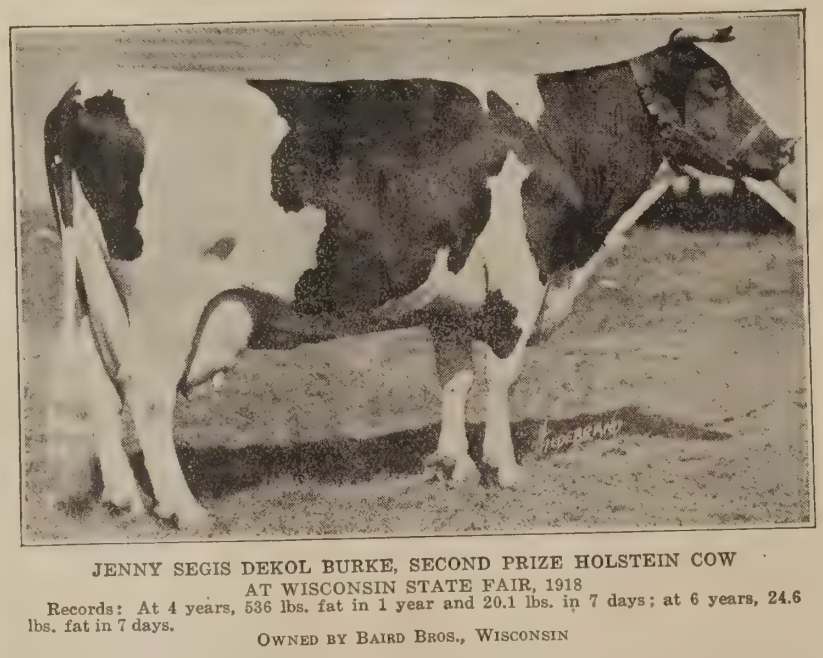


According to crop investigators, the winter wheat plant in the Southwest never before was in such excellent condition. The growth of the plant was so rapid during the fall period, the result of mild weather, as to make grazing imperative. The plant had developed sufficiently to joint, thus making "winter-kill" damage possible. But dairymen were eager to take advantage of the excellent wheat growth. With hay prices at the highest level in history and feeds in general scarce, the desire to economize in feed purchases was general.

One of the reasons for the abundant pasturage is the fact that a record has been achieved by the farmers of Kansas that will doubtless live with the ages. According to the annual report of the Kansas State Department of Agriculture, 10,825,631 acres of the soil of the Sunflower State were seeded to winter wheat the past fall, the largest acreage in the history of the state. Were one able to estimate with any degree of correctness the saving in feed bills of dairy interests made possible by the abnormal grazing period, the figure would doubtless run into the millions of dollars. The late grazing, which made up in a great measure for the drouth losses during the summer and early fall months, has been the outstanding factor in the easier tone in the feed markets of the country.

Restaurants in Kansas City are making capital of the fact that "we serve the best creamery butter". Signs proclaiming this fact are considered in Kansas City as strong attractions to patrons. With butter quoted in that city at more than 65 cents a pound, it means much to serve it in restaurants. But this is not increasing the use of oleo, for the patrons in some restaurants pay extra for butter, say five cents a tiny cube, or make payment through the prices put on the other food which they order.

In addition to the natural osbtacles, dairymen of the Southwest are forced to combat, in placing the milk producing industry on a profitable scale, propaganda of some public food workers, which under the cover of patriotism and conservation, must now be overcome. The latest campaign inaugurated in Kansas City and generally throughout the Southwest by state food administration officials is the "Use Oleomargarine" slogan. Consumers are being urged by the local food officials to substitute the margarine products for butter, and "thus reduce by practically 100 per cent the food costs in the home".



However, the large butter distributors report that the newer consumers are particularly dissatisfied with the so-called substitutes for butter. "It is evident," one distributor of both oleo products and butter remarked, "that we are receiving few, if any,

Advocates Less Labor in Silo

HOARD'S DAIRYMAN:—In a recent article on filling silos you state that the silage should be two feet higher around the edge than in the center. It is at this point that I wish to take issue with you. While I do not doubt the truth of this, I am inclined to believe that the gain does not balance the extra cost.

The farm where I gained most of my experience with silos and silage was equipped with three 250-ton silos of the hinge-door kind and one 200-ton concrete pit silo. These silos were air-tight. In filling the silos the end of the blower pipe was so arranged that the silage would fall directly in the center. In this way the silage would pile up in the center and then slide down to the wall. It would appear that all the corn would roll down to the wall and somewhat hinder the feeder as it would have to be mixed as taken out. This, however, was not the case, as was afterwards proved. The air being forced into the silo through the blower pipe caused the leaves to be evenly distributed. In fact, there was a little more corn in the center than around the edge. Three or four times a day a man would go in and tread the edge for ten or fifteen minutes. Experience proved that it was necessary to pack it some to prevent pulling away from the wall. There are always times when a machine man can go in as it only takes a few minutes to do it. In this way the labor of one man is saved, which, by the way, is no small item at the present time. From observations on different farms with silage in all stages of maturity, I am led to believe that it ought to be packed next the wall not less than four times daily for best results. With any amount of work and packing you cannot expect to make wholesome, sweet silage in any but an air-tight or nearly air-tight silo.

When silage is solidly packed it will freeze harder and to a greater depth than when loosely packed. The reason is very plain. If the edge is kept a foot lower than the center you will have very little difficulty with frozen silage in winter.

Before the above plan was adopted several experiments covering three years were carried out. The first experiment was the one you advocate. This proved too costly even when labor was cheaper and more plentiful than it is now. Neither was the corn evenly distributed in the silo. In the second experiment the silage was blown in but was not packed with the result that it pulled away from the wall and spoiled to a depth of about one foot. This was a costly experiment. The next experiment was the one described above. This one proved to be the happy medium. With it you are assured good, sweet silage without extra cost. Alfalfa has been used alone and with corn and so far as I can see the results have been the same. With the present scarcity of labor any plan or system that will eliminate one man and still give the same results ought to be a Godsend to the farmer.

Ft. Madison, Iowa. G. E. C.

[Editor's Note: Possibly we have been wrong in our silo filling methods, but it has brought us good results in our own experience and is the general practice. It is quite possible that the silos of our correspondent were high and the greater weight of silage compensated for the lack of keeping the outer edge high and well tramped. Also, the corn may have contained more moisture than usual and therefore packed better. Until further experience is cited we cannot approve of allowing the cut material to drop into the center of the silo and to give it practically no further attention. We would be pleased to hear from others who may have followed or observed both methods.]

10,000 More Farmers Every Year

In engines, as in all other farm machinery, the modern movement is toward light weight.

A few years ago, many farmers could not understand how a Cushman, weighing only 40 to 60 pounds per horsepower, could do as much work, and run as steadily, as an engine weighing 200 to 250 pounds per horsepower.

Since then the Cushman light weight idea in engines has swept the country, and almost every farmer now understands that weight does not mean power or steadiness, and that a Cushman is so well balanced and governed so accurately that it does not need a large base and heavy moving parts.

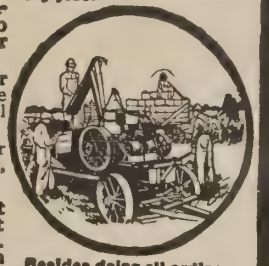
That is the reason 10,000 more farmers now choose Cushman Engines every year.

Now Choose One of the All-Purpose

CUSHMAN

Light Weight Farm Motors

Weigh only one-fourth as much as ordinary farm engines. Light weight and higher speed mean **more jobs, easier handling, less waste of material and fuel and steadier running.** Cushman Engines are the standard light weight engines of the world.



The famous 4 H. P. Cushman on a Binder just as satisfactory for all stationary jobs.

4 H. P. weighs only 190 lbs., being only 48 lbs. per horsepower. This is the most useful farm engine ever built. Besides doing all ordinary jobs, it may be attached to any grain binder, saving a team; and in a wet harvest saving the crop. Also it may be used on corn binders and potato diggers. Very easy to move around from job to job.

8 H. P. weighs only 320 lbs., being only 40 lbs. per horsepower. For all medium jobs. Also may be attached to hay presses, corn pickers, saw rigs, etc. 8 H. P. and larger Cushman Engines are all double cylinder.

15 H. P. weighs only 780 lbs., being only 52 lbs. per horsepower. For heavier farm jobs, such as 6-hole corn shellers, ensilage cutters, large feed grinders, small threshers, etc.

20 H. P. weighs only 1200 lbs., being only 60 lbs. per horsepower. For heavy duty jobs, such as shredders, shellers, grain separators, heavy sawing, etc.

Besides doing all ordinary jobs, 8 H. P. may be attached to Hay Baler.

Cushman Engines stand up under wear and tear and do not wear unevenly and lose compression. Every running part enclosed free from dust and dirt and properly lubricated. Equipped with Throttling Governor, Carburetor, Friction Clutch Pulley and Water Circulating Pump. Ask for Book on Light Weight Engines.

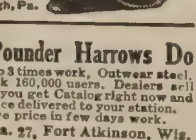
Cushman Motor Works 817 N. 21st Street Lincoln, Nebraska

WATER and LIGHT in HOMES EITHER OR BOTH

The Milwaukee Air Power Water System delivers fresh water anywhere direct from the well. No water storage tank to freeze or foul the water. We have pumps for all sizes and depths of wells.

RUNNING WATER Milwaukee Air Power WATER SYSTEM **ELECTRIC LIGHT**

The Milwaukee Electric Light System is sold with the water system or separate, as desired. They can both be run with one engine—giving water, light and also power for cream separator, churn, washer, shop and home.



Write for illustrated, descriptive matter telling how you can have fresh water, hot or cold, hard or soft—also electric light and power all over your house, barn and yards.

MILWAUKEE AIR POWER PUMP CO., 876 Third St., Milwaukee, Wis.

Coming Events

Montana Dairymen's Roundup at Billings, Jan. 9th and 10th, 1919.

Massachusetts Dairymen's Association meets in Horticultural Hall, Boston, Mass., Feb. 10, 1919. Acting Secretary, O. A. Jamison, Amherst, Mass.

Illinois Dairymen's Association meets at Bloomington, Ill., Jan. 21-23, 1919.

Western Dairy Products' Show and Annual Meeting of Western Dairy Instructors' Association will be held at Boise, Idaho, Feb. 10, 11, 12, 1919.

Minnesota State Dairymen's Association hold annual convention at Waseca, January 15-17, 1919. Chris Heen, Secretary, Osakis, Minn.

Illinois State Dairymen's Association at Bloomington, January 21, 22, 23, 1919. George Caven, Secretary, 136 W. Lake St., Chicago.

Wisconsin Buttermakers' Association hold annual convention at Eau Claire, February 4-6th, 1919. Prof. G. H. Benkendorf, Secretary, Madison.

Kentucky Dairy Cattle Club meeting and Dairy Show, Jan. 30, 1919, at State University, Lexington. Secretary, J. J. Hooper, Lexington.

Minnesota Dairy Course

The dairy short course offered every winter by the College of Agriculture of the University of Minnesota will open on January 6 and close on March 1.

This course offers work both in production and in the manufacturing of dairy products. For the first month the students in both production and manufacturing follow the same subjects: Dairy cattle selection, feeding and management; milk and cream testing; farm butter, cheese, and ice cream making.

With the beginning of the second month the class divides into two sections. Students of production continue their work in feeding and breeding, and in additio.. make a study of the subjects of registration and transfer of pure-bred animals, and of pedigrees. A course in dairy farm records is also offered. Beginners in creamery buttermaking spend their time in the creamery, making a study of starters, cream pasteurizing, churning, making tests that aid in control and quality of composition, and, if they so desire, making a study of creamery bookkeeping.

The tuition fee is $10.

While positions cannot, of course, be guaranteed, the division of dairy husbandry, under whose auspices the course is offered, makes every effort to locate those who, after finishing their work, wish to secure places.

Prevailing Milk Prices

The following table presents a comparison of prices received by farmers for milk in the month of November, with the prices agreed to for the month of December, 1918. The prices as stated are quotations for one hundred pounds of 3.5% milk, delivered by farmers at local milk plants or at the farmers' country shipping points:

Geographic sections	Dec. range of prices	Ave. Dec. prices	Dec. increase over Nov.
New England	$3.86—$4.53	$4.09	$.03
Middle Atlantic	3.78— 4.44	4.09	.20
East North Central	2.85— 3.95	3.72	.15
West North Central	3.16— 3.88	3.59	.01
South Atlantic	4.00— 5.65	4.52	.22
East South Central	3.52— 4.80	3.39	
West South Central	4.20— 5.00	4.60	.58
Mountain	3.15— 4.06	3.58	.02
Pacific	3.15— 3.70	3.45	

The prices given in the above table were secured by the Bureau of Markets, U. S. Department of Agriculture, from reports from 300 different markets.

Prices per quart of standard grade milk received by producers and paid by consumers in several widely scattered sections of the country during the month of December were as follows:

Market	Cents per quart: Producer receives	Consumer pays	Butterfat allowance*
San Francisco, Cal.	7.7	14	$ .40
Denver, Colo.	7.5	13	1.00
Washington, D. C.	10.0	17	.46
Jacksonville, Fla.	11.2	18	.50
Chicago, Ill.	9.18	14	.40
Indianapolis, Ind.	6.8	14	.90
Des Moines, Ia.	7.8	15	.50
Topeka, Kans.	7.9	14	
New Orleans, La.	9.5	16	.23
Boston, Mass.	9.75	16.5	.40
Grand Rapids, Mich.	7.5	14	.30
St. Paul, Minn.	9.0	13—14	.50
St. Louis, Mo.	9.1	14	.30
New York, N. Y.	9.6	17	.40
Cincinnati, Ohio	8.8	14	
Eugene, Ore.	7.2	14	
Pittsburg, Pa.	9.4	15	.50
Philadelphia, Pa.	10.25	14	.40
Memphis, Tenn.	8.5	16	
El Paso, Tex.	9.9	19—21	.40
S. L. City, Utah	7.1	12.5	
Spokane, Wash.	7.6	15	.50
Milwaukee, Wis.	9.0	13	

*The prices per pound of butterfat quoted in this column refer generally to the allowances made for variations from the butterfat standard applying to the basic price for whole milk shown in the first column of this table. In those markets where the price of whole milk is based solely upon its butterfat content, the given quotation per pound of butterfat includes payment for the non-fat contents of natural milk as well as for its butterfat content; and for that reason the butterfat allowances in such markets are generally much higher than those quoted for markets in which the given allowances refer only to premiums or deductions per point of butterfat above or below the given standard.

The prices quoted for producers are for milk f. o. b. city and to get the actual price the various transportation costs must be deducted. It will be noted that in December Chicago producers were paid 9.18 cts. per qt. ($4.27 per hundred) f. o. b. city, whereas the producers actually received 8.1 cents per quart ($3.77 per hundred) at their country shipping station; like variations occur for other cities according to differences in transportation costs from various shipping points. The prices given are based upon an average test of 3.5 per cent, a differential of 4 to 5 cents per point being paid for higher tests. The consumer's price is for milk bottled in quarts and delivered. The average fat content of the milk as delivered is 3.5 to 3.7%; Washington, New Orleans, and Memphis selling milk testing 4%. Comparison with November prices may be made by referring to a similar report appearing on page 700 of our issue for December 13, 1918.

In Minneapolis and St. Paul the f. o. b. prices are based on the average price of cheese as established by the Plymouth, Wisconsin, Cheese Board. The price of ten pounds of cheese plus 70 cents transportation and marketing expense is the price paid by dealers in these cities for one hundred pounds of 3.5% milk.

Special or Grade A milk retails for 19 cents per quart in Boston and New York, for 18 cents in Chicago, and for 16 cents in Philadelphia. Certified milk retails for 24 cents per quart in Boston, 23 cents in New York, 26 to 27 cents in Philadelphia, 21 cents in Chicago, and 20 cents in San Francisco. Buttermilk retails for 10 cents per quart in these cities, except for San Francisco where the price is 8 cents. Special fermented milks retail for 10 to 18 cents per quart. Cottage cheese retails for 30 cents per pound in Boston, 10 cents in New York, 9 cents in Philadelphia, 20 cents in Chicago, and 15 cents in San Francisco.

Commercial cream testing 15 to 20% retails for 15 cents per half-pint in Boston and Chicago, 14 cents in New York and San Francisco, and 18 cents in Philadelphia. Cream testing 22 to 30% retails for 17 cents per half-pint in Boston, 18 cents in Chicago, and 27 cents in New York.

Annual Meeting of Dairymen's League

HOARD'S DAIRYMAN:—The New York Dairymen's League has held its annual meeting. There were some differences of opinion in relation to the League management, but nothing seriously obstructive came up. An opposition ticket for directors was prepared, but was not presented. There is some change in League plans which seem to be for the better. We are glad to know that it is proposed to turn back to the locals some of the money collected from the sale of milk, which is only a fair proposition. In the election of directors there were only a few changes, and the executive committee remains in practically the same hands as last year. A large amount of money is collected by the one cent a hundred asked for making sales. The sums collected for membership at twenty-five cents a cow, it is proposed to set aside for a permanent fund as soon as it can be accumulated from commissions. The original twenty-five cents a cow had to be used for several years to maintain the organization, but it can now be refunded for the most part, and very shortly in its entirety. T seems like a wise move.

It is proposed to prepare to re Lurse dairymen whose milk cannot sold at full League prices by sc sort of a tax on those who do get prices. There are localities every r and then where dealers refuse for reason or another to buy the milk least at full prices. This leads to crimination and dissatisfaction. seems clear that all members ough come in for equal benefits, and hope that the plan mentioned solve the difficulty.

While there has been some c cism in reference to the League, may have been beneficial. It app that the management has, for most part, the confidence of the m bership. Close inspection of its tivities is perfectly proper, and so as known is encouraged by the m agement. The finances are seemi in good shape. The investigation the city have attempted to throw trust on the League's finances hint at serious charges in relatio the public. So far as members concerned these hints are laughed but in the city there is apparently increasing distrust of dairymen their organizations.

While the League meeting was ing held in Jersey City there was lished many insinuations. "Dairy and milk distributors meeting secr in Jersey City are formulating p to thwart the Swann investigatio is what one paper had to say, much else of a similar character. one case it was urged by an off of the city that the city should do pasteurizing because now it is clai that the consumers are paying 000 a day for this service and the milk is still sold in the raw s This, the report affirms, is detrime to health and in addition is a swi Then the first-page report goes to say that the "Dairymen's Le officers who combine with the tributors' trust to control the su and fix the price for milk, will tolerate any municipal pasteu tion." They say, "Threats were newed that unless the Swann inc was withdrawn the combine w stop the supply of milk for the c So many such items of nonsense being published that one hesitat believe there is any reliability le the city press.

The board of directors is so stituted that practically all o former officers are to be re-ele and have already been so ele The only change that I know of is of the substitution of John D. M of Susquehanna as vice-preside the place of F. H. Thomson of land Patent. Mr. Thomson has in poor health for a part of the past, and it is not a matter of prise that he wishes to be rel from the most active service. Miller has been the attorney fo League for some time and has a timate knowledge of its affairs. Cooper continues as president Albert Manning as secretary. er, Manning, Thomson, Kershaw Kirkland continue as executive mittee.

Resolutions were adopted at meeting looking to certain impo reforms. Among these is the e lishment of 250 miles instead o as the basic zone distance in m prices. Another asks that payn be made by all companies twice month, and still another req that daily weights be given the ers. One important item had with admission of new membe stockholders, who have thus fa fused to become members. I d understand that this applies to territory or new men coming a locality, but only to those who

len offered and urged to assist and ve refused.

The meeting at Grand View Hall in rsey City was well attended, the legates numbering 1,500, represent- 60,000 producers. It is a ques- n in my mind whether proximity New York City is the best place such a meeting. This is a farm- ' meeting and does not need too ch publicity by the city newspa- rs. When it comes to the question publicity relative to the benefits of lk and its cheapness as a food, the y is the place, but the annual busi- ss meeting might as well be less spicuous in the city and more so the country.

New York. H. H. LYON.

ennsylvania Holstein Breeders

The State Holstein-Friesian Breed- ' Association of Pennsylvania will d its annual meeting at Harris- rg, January 22nd, beginning at ten lock, in the Assembly Room of the an Harris Hotel. A very interesting gram has been arranged. Speak- recognized as being the best Hol- in authorities have been secured. D. Aitken, president of the Nation- Association, is to be one of the akers.

t is anticipated that this will be e of the greatest Holstein meetings r held in the state of Pennsylva- , as the breeders throughout the te realize that a great effort must put forth if the National Associa- n, which meets in Philadelphia next ne, is to receive the royal recep- n that it has been accorded in other tes. The meeting is called during Farmers' Week at Harrisburg, en all the various state agricultural anizations have their meetings. vernor Sproul will be inaugurated the 21st, and this will give the eders throughout the state an op- tunity to visit Harrisburg for the uguration and spend the week fitably attending the various ex- its and meetings.

t is planned to hold a consignment e the day following the meeting, uary 23rd. Many of the most minent breeders from the state e consigned cattle to be sold at t time, and buyers wishing to se- t some choice foundation stock uld do well to attend this sale. Mr. Eugene B. Bennett, president the State Holstein-Friesian Asso- tion, will be at the Penn Harris tel, Harrisburg, after January 1st, l will answer any questions or cor- pondence pertaining to the sale or eting. H. C. REYNOLDS, Sec.

Farm Community Organized—Gets Results

What a farm community can do for own progress when the get-to- her spirit prevails is well shown h the Burwood community, Will- ison County, Tenn. This commu- y, encouraged by the county agent, med an organization which em- ced men's interests, women's in- ests, canning clubs, corn clubs, and ltry clubs. In this way they re- ed a community charter and pro- ded to work. When the wheat in- ase was asked, 50 acres was as- ned to Burwood community; the mmunity came across with 323 es in 10 days. Similarly organized mmunities made it possible for lliamson County to pledge an in- ased acreage of 2,000, while the nty was asked for only 1,369 es.

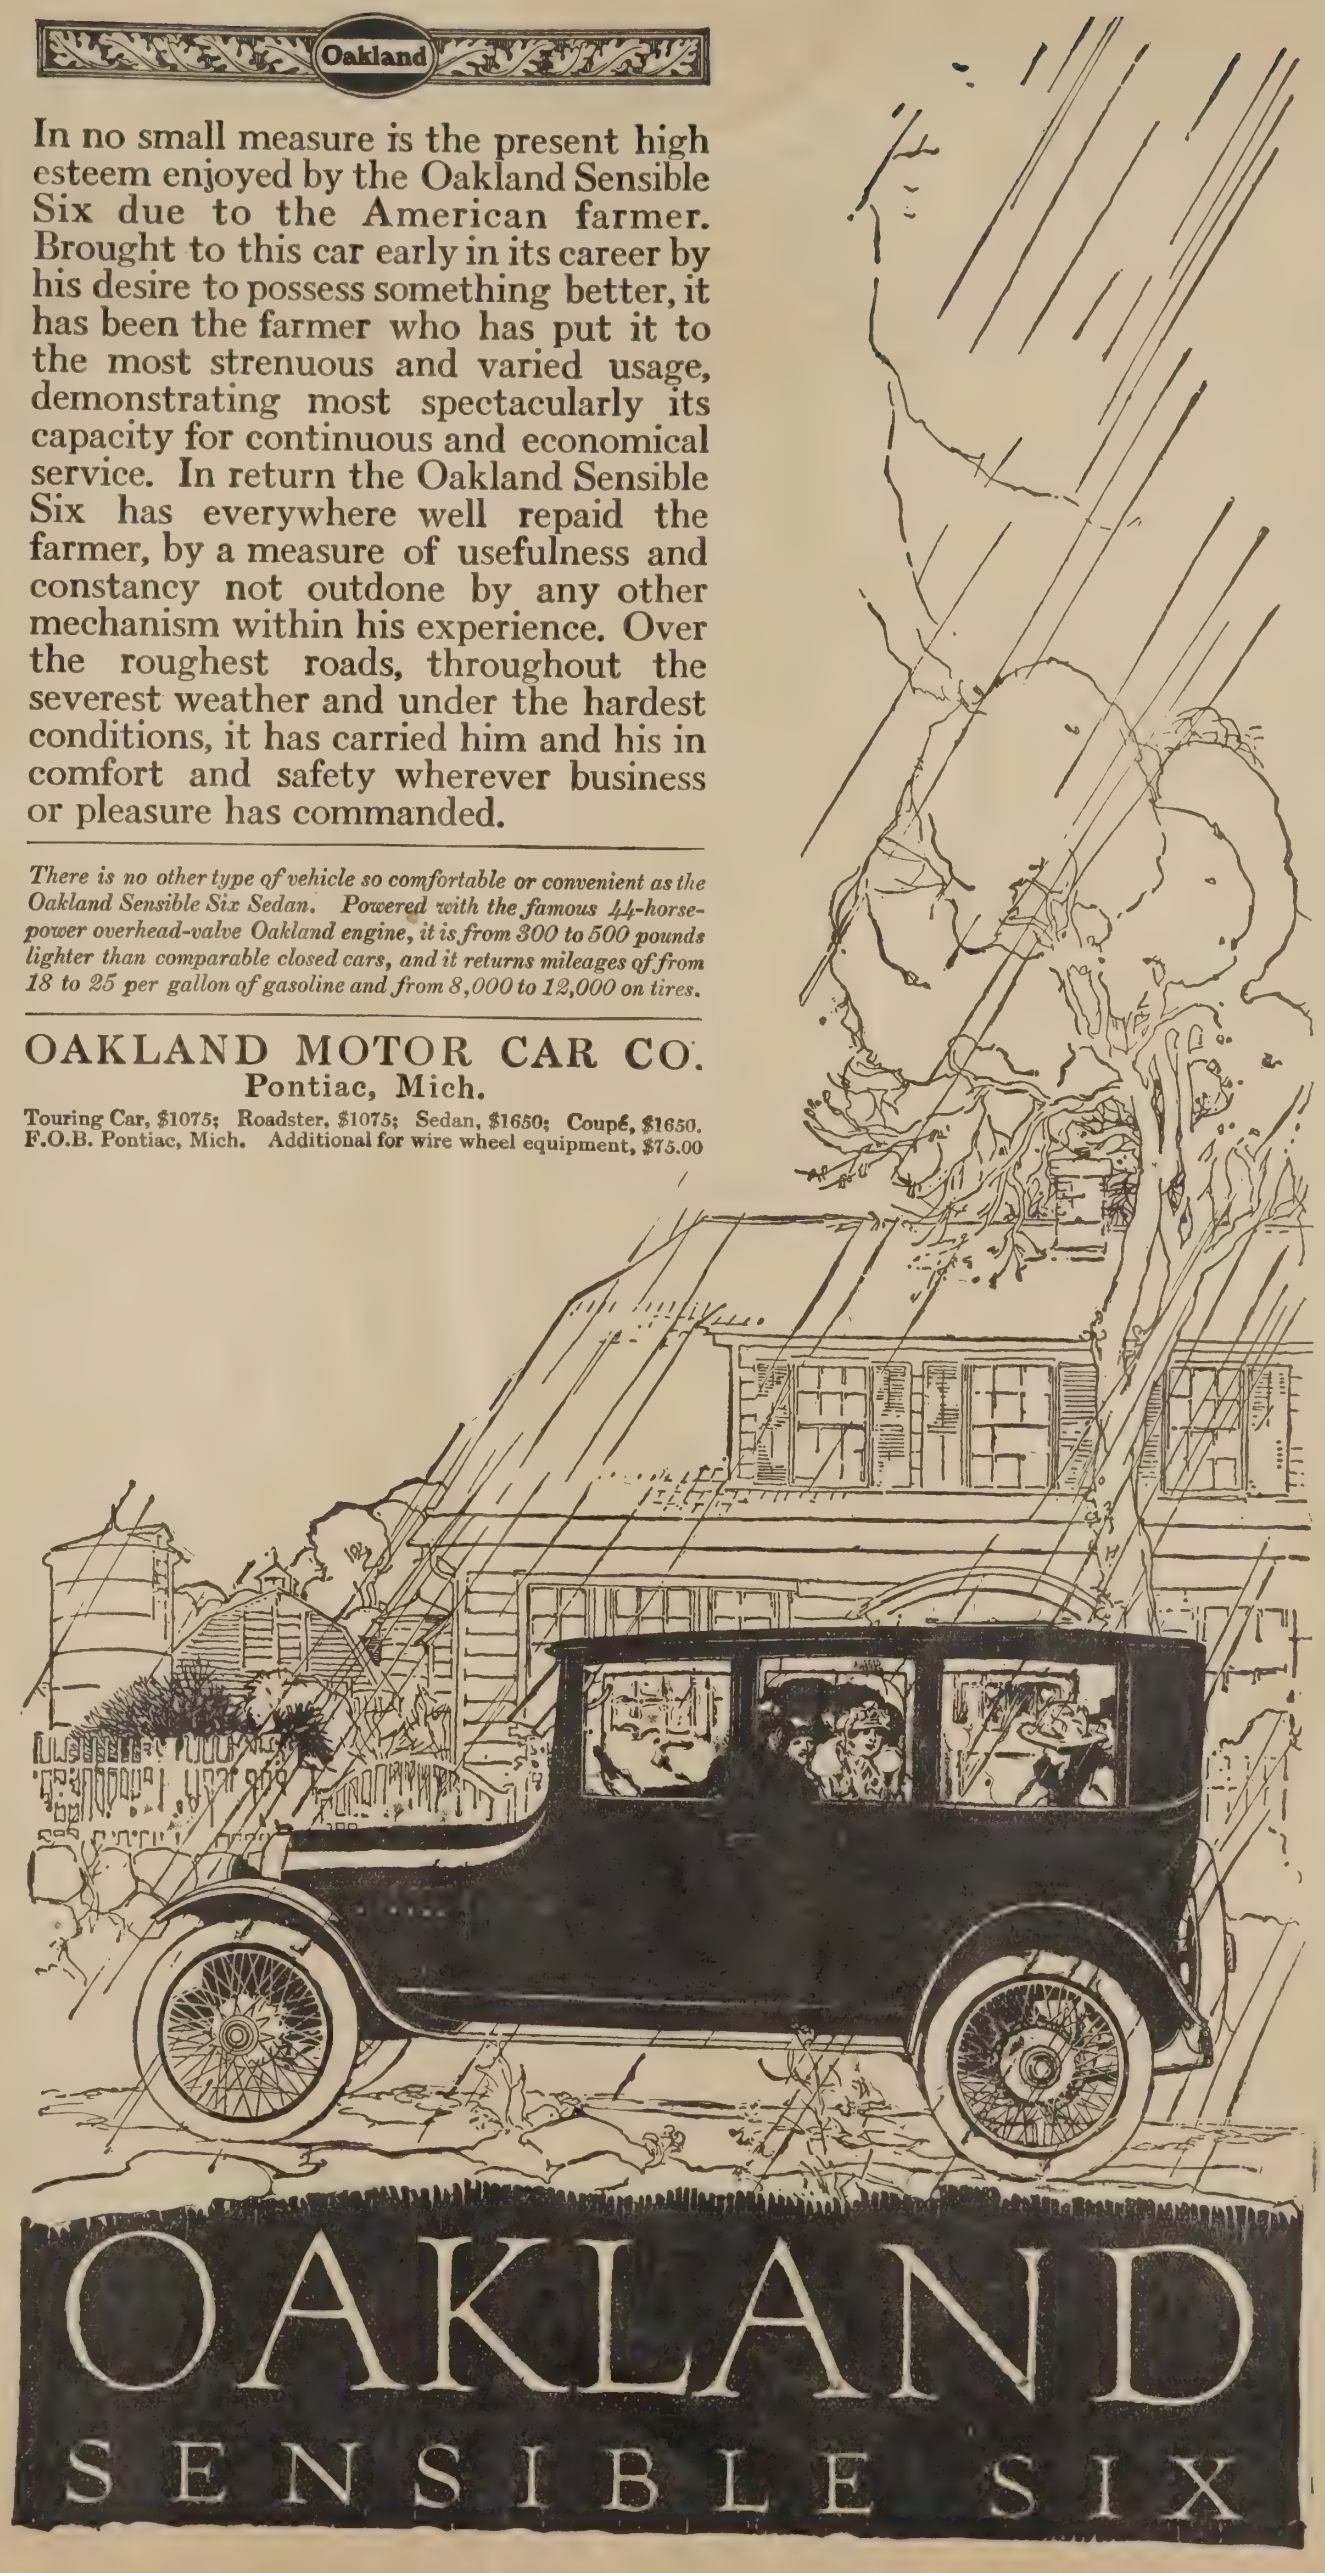
or week ending Dec. 20, 1918: umber of animals registered: ls, 210; cows, 526; total, 736. nber of transfers recorded: Bulls, ; cows, 593; total, 779.



Oakland

In no small measure is the present high esteem enjoyed by the Oakland Sensible Six due to the American farmer. Brought to this car early in its career by his desire to possess something better, it has been the farmer who has put it to the most strenuous and varied usage, demonstrating most spectacularly its capacity for continuous and economical service. In return the Oakland Sensible Six has everywhere well repaid the farmer, by a measure of usefulness and constancy not outdone by any other mechanism within his experience. Over the roughest roads, throughout the severest weather and under the hardest conditions, it has carried him and his in comfort and safety wherever business or pleasure has commanded.

There is no other type of vehicle so comfortable or convenient as the Oakland Sensible Six Sedan. Powered with the famous 44-horse-power overhead-valve Oakland engine, it is from 300 to 500 pounds lighter than comparable closed cars, and it returns mileages of from 18 to 25 per gallon of gasoline and from 8,000 to 12,000 on tires.

EDITORIAL COMMENT

CO-OPERATIVE MARKETING COMPANY

The Chicago Milk Producers' Association recently formed a co-operative marketing company, the president being George Brown; vice-president, Robert Oman; secretary, D. L. Putnam; and treasurer, F. H. Reese. These men have all been active in the work of the Chicago Milk Producers' Association and fully appreciate the necessity of a marketing company. It is our understanding that it is not the purpose of this company to enter into retailing market milk, but rather to lay plans to take care of the surplus milk which has always been a large factor in depressing the wholesale price of market milk.

We most heartily believe in making arrangements to take care of the surplus milk, but we are not yet ready to subscribe to farmers retailing their milk in the city. This is a tremendous problem and it requires large capital and much experience to do it successfully and economically. We believe the producers should first learn how to prepare their own products for market and to sell them co-operatively before they attempt to handle the distribution of milk in a city.

We shall watch this new co-operative marketing association with a great deal of interest, as we believe in the establishment of institutions for taking care of the surplus milk. We have again and again stated that the milk producers in the Elgin district were shortsighted in permitting local creameries and cheese factories to go out of existence, as they offered the only means for caring for their product when the dealers in Chicago did not pay a fair price for milk.

HOUSING FARM MACHINERY

Does it pay to go to the expense of building a machine shed, or provide canvas to cover the machinery at night that it may be protected from rain or dew? Mr. Heddles, chairman Wisconsin Council of Defense, in riding from Lancaster to Madison, a distance of 70 miles, busied himself in noting the amount of machinery he could observe from the car window on one side of the track. He listed the machinery and then went to a dealer and found that he had seen $6,000 worth of machinery on one side of the track in that short distance.

In discussing this subject with men who have been engaged in farming for over 40 years, it was brought out that a harvester put under a shed when not in use and covered with a canvas at night during harvest would last at least 20 years, providing the operator took good care of it in other respects. It was held by these men that a harvester exposed to the elements would last but five years. One farmer in the crowd stated that the harvester he used this year for cutting his grain was 27 years old. It was either put into the machine shed at night or covered with a canvas. He further makes it a practice when the harvester is put away to see that all worn parts are replaced and it is made ready in every respect for use the next season.

The shiftless farmer can't afford to build a machine shed for the protection of machinery. He can't afford to put it into good repair when he is through using it. But the good farmer, the one who makes money, says he can't afford to leave his machinery exposed to the elements or neglect to give it proper repairing.

BLIND STUPIDITY

On the bill of fare of a hotel in one of the biggest dairy counties of Wisconsin, we found the following statement:

"Your attention is respectfully directed to the fact that the women of the Lake Shore Counties, together with all patriotic societies, have agreed to refuse to use eggs and butter for ten days beginning Wednesday, December 11th. All homes, hotels, and public eating houses have been requested to co-operate to the fullest extent and you are asked not to insist upon having either of these articles. In this way it is hoped to lessen the present high cost of living. Troco butter and jelly will be served as a substitute."

Here is a splendid example of misdirected reasoning. The proprietor of this hotel depends largely upon the dairy industry for his support. The women of the Lake Shore Counties are, too, profiting to a large degree through the dairy industry of Wisconsin, yet they have bound themselves together for the purpose of breaking down the prices of butter. They are striking at the very heart and vitals of Wisconsin's greatest industry. These people have not considered the reasons for butter being high in price.

The truth of the matter is, that the price of butter is only in its proper relationship to its cost of production and the prices of other foods. Butter at its present price has not risen proportionately higher in price than sugar, flour, shoes, etc. Yet these people have picked out butter, a product most vital to their own welfare, and hope by not using it to decrease the high cost of living. They have not asked themselves whether they would get butter if they did not pay the cost of production. They have failed to ask if Troco, which they recommend, will nourish their growing children or themselves as well as butter. For blind stupidity and ignorance of facts, the appeal which is made on the menu of this hotel would be difficult to equal.

SKIMMILK CHEESE LAWS

The present statutes of Wisconsin permit the manufacture of skimmilk cheese, but it must be so made as to measure ten inches in diameter and nine inches high. The purpose of prescribing this particular size was to distinguish such cheese from the regular cream cheese on which the reputation of Wisconsin is built, and relieve the latter from unfair competition of the skimmilk product.

This law has generally been held to apply to cheese made on the Cheddar or similar process, special exemption having recently been made for Swiss cheese. Despite long usage and understanding to the contrary, Dairy and Food Commissioner Weigle is of the opinion that impartially construed, the law applies to all cheese manufactured either from skimmilk or partly skimmed milk. It would, of course, be ridiculous to require cottage cheese, Camembert, and other similar types of cheese to be put up in packages ten inches in diameter and nine inches high. Mr. Weigle has, therefore, recommended to the state legislature that the law be so amended as to allow the manufacture of these special types of cheese in the manner they are now made.

We doubt whether the law would ever be enforced to the ridiculous point feared by Mr. Weigle, but there is no reason that we now see why it should not be so amended as to specifically permit the manufacture of the several kinds of cheese now made from skimmed or partly skimmed milk. We do not believe that the shape of the cheese manufactured on the Cheddar process should be changed. There should be some clear demarcation, so that a cheese made from skimmilk or whole milk may be easily distinguished. Further, we do not believe that a cheese, like Brick, Limburger, or Swiss should be permitted to be made of skimmilk and placed on the market in the form in which it is now known, as this would deceive the consumer and prove injurious to our cheese industry.

WANTS GOOD BUTTER

Recently at a homelike and splendidly conducted hotel in Alabama, this conversation took place between the proprietress and several of her guests. She said: "I am glad to meet you gentlmen as I would like to learn where I can purchase butter at a lower price. My butter bill these days is extremely high, as I use it in cooking instead of other fat."

One of the guests suggested cottonseed oil for frying steaks. To this, the woman replied: "I cannot prepare a steak which suits my taste without a liberal use of good butter." Another suggested that pie crusts could be made of lard. To this she said: "I know lard is used for shortening, but I cannot make pie crusts without butter. The fact of the matter is, nothing I make has the right flavor unless I use good butter."

This woman has a keen taste and a splendid conception of a toothsome meal. If we had more people like this, there would be no danger of so-called butter substitutes replacing the demand for good butter. We appreciate that when the prices of butter are high many people use some oleomargarine to supplement the butter. Even at the present high prices of butter people are using it freely and as far as their pocketbooks will permit. Of course, many do not appreciate the food value of butter, and there is need of an educational campaign to inform these people regarding the superiority of butter. Let us ever bear in mind that good butter is always in demand and its future to no small degree depends upon its quality. The flavor characteristic of butter appeals to the finer tastes of all people. Good butter is the strongest enemy of oleomargarine, and for this reason it is highly essential that nothing but good butter be made.

PACKERS AND THE DAIRY INDUSTRY

There is some danger of the dairy industry falling into the same plight as the meat industry. Several of the large packers are already handling large quantities of butter and cheese and each year finds them doing a larger volume of business. If the dairy farmers of this country are alert to their own welfare they will not permit a few large concerns to dominate their business.

The report of the Federal Trade Commission, regarding the dealings of packers, states: "The five great packing concerns have obtained such a dominating position that they control at will the market in which they buy their supplies and the market in which they sell their products, and hold the fortunes of their competitors in their hands." This is not a healthy condition. It breeds discontent, even though the packers pay a fair market price to the farmer for his products and sell to the consumer at a small margin of profit. We must sustain a certain amount of competition, of independence in marketing, if farm products are to be sold at fair prices and if the consumer is to buy them at a reasonable price, and all concerned satisfied.

We hope that through organization, which is growing on so rapidly among the milk producers of the country, they will see the trend of affairs and will not permit the dairy industry to fall into the hands of a few firms. Enterprises like those in Vermont where butter, cheese, cream, and ice cream may be manufactured or whole milk may be sold for direct consumption, should be established everywhere in this broad land. If we do not organize the dairy industry and provide ways and means for handling milk and its products, we are likely to find ourselves in the same position as those who produce meat.

TRACTORS AND DAIRY FARM

The tractor has had a large part in solving the labor shortage dilemma and in making it possible for farmers to increase their production despite the war handicaps. It has demonstrated its value in many communities, not the least of these being where the average sized dairy farm prevails. According to Professor Jones of the Wisconsin College of Agriculture, one farmer out of every four operating a 100-acre farm in that state used a tractor last year and a large increase in number is predicted during the coming year.

As an indication of the demand and adaptability of the tractor, we know of no better illustration than was recently brought to our attention by receiving a copy of the Highland Press, a local paper published in a Wisconsin village of only 1,000 people. The first item to meet our eye was the report of cheese prices as paid on the local board, and the importance of the cheese industry is apparent from the fact that Iowa County, in which Highland is situated, has some 140 cheese factories. Immediately following this item was the report that a local implement dealer had just received a shipment of twelve 10-20 tractors, ten of which were already sold. The newspaper then went on to describe just where these tractors had gone and that the dealer had already an order in for another similar shipment.

The above item is significant from the fact that these tractors were sold in a small village at the end of a spur railroad, and in a peculiarly strong dairy district, and also from the fact that Iowa County is quite a hilly section. This is but further evidence of the adaptability of the tractor to dairy farm conditions, and that hilly land does not bar their introduction. The future of the tractor on the dairy farm is best told by illustrations of this character and by the further fact that in visiting dairy communities, one notes tractors placed here and there throughout the country and the interest of the neighbors in what is being accomplished by the somewhat noisy, smelly, iron horse.

Leasing Queries

As a subscriber to your valuable paper I am going to ask you what is customary and considered fair rental when renting a farm on a share basis. Landlord furnishes a 150-acre farm, good barn and silo, a fair house, and the usual farm buildings, also stock and machinery as well as horses. Tenant to assume one-half of agreed value of stock and all the machinery. Tenant has $500 worth of s

s part of his stock. Tenant also has a delivery
which will be used almost entirely for business
onnection with farm work. Should landlord as-
e one-half in the car or at least of maintenance
ense? Should tenant get his meat, milk, and
s prior to figuring a division of products? Ten-
ve agreement is a half and half proposition.
andlord's investment is approximately $20,000.
ant has an earning power in town of better
1 $1,800 a year. Should this have any bearing
ivision of income, tenant being an experienced
ner and business man?
fton, Minn. A. G. C.

nder the share system of renting a dairy farm
owner furnishes the farm, buildings, and one-
the productive live stock. The tenant fur-
es the movable equipment, the work stock, and
all the labor including the delivery of mate-
to the farm and the marketing of the product
he creamery and city. The two parties share
ally as a rule in the purchase of feed, seed, and
ilizer. They also share equally the cost of
shing and silo filling, with the exception that
tenant is presumed to furnish all the extra
r required with the exception, possibly, of the
neer and the owners or operators of the equip-
t itself.

nder the general rule that the tenant is to de-
r all material to the sale point, we would ex-
that where horses are not used, the tenant
ld pay for the automobile up-keep and running
ense. The tenant is usually allowed a certain
of ground for his private garden, a reason-
amount of milk from the herd, and a reason-
amount of the poultry. In the case of the kill-
of meat animals the tenant and landlord usu-
divide half and half or some other equitable
ngements are made. In general it may be said
the owner is to receive half of all products
from the farm, including surplus poultry prod-
, fruit, garden stuff, etc.

nder this system of renting the earning power
he tenant is seldom considered, except that the
wd owner will appreciate that in order to se-
a man of this character he must make certain
essions and that it is profitable for him to do
We have known of cases in which the owner
supplied all the cattle and still permitted the
nt to share in half the proceeds of the farm,
uding the increase in stock. In particular
s where the owner has a personal interest in
tenant he will sometimes turn over the entire
n equipment and share half and half with the
tenant. In such cases, however, the tenant
chases all new machinery required and is pre-
ed to keep the equipment owned by the pro-
tor in good repair, ordinary wear being except-
The original personal property continues in
name of the owner, but ordinarily he does not
uire any payment for the natural wear and
reciation. This latter method is quite unusual
most often applies where a son or relative of
owner becomes the tenant.

Wages of Farm Manager

is my intention to place upon our farm a pure-
l herd of Holstein-Friesian cattle free of tuber-
sis, and in so doing the problem confronts me
o what arrangement is made in regard to farm
. Heretofore we have allowed the estate to be
ned on shares, and as first class cattle are a
ty in our county, pure-bred stock farming is an
rely new project.
desire to place a married man on the farm who
apable of taking care of high class pure-bred
le and at the same time is an able farmer.
at would you consider an adequate salary for a
in such a position, the farm being 175 acres?
, what would you consider an adequate salary
ordinary farm help laboring under such a man?
it be understood that we furnish all the imple-
ts and accessories necessary to farming.
ewisburg, Pa. G. F. M.

ages or salary are so much a matter of pri-
bargaining that it is difficult to give any exact
res, and should we do so we might lead our in-
er materially astray. Then, too, there is the
ing capacity of the men and their relative
ndance or scarcity in a particular community.
order to get the viewpoint of a well informed
, we referred this inquiry to Professor Hibbard,
l of the Economics Department at the Wisconsin
ege of Agriculture. Professor Hibbard gives us
following reply:

t can only be said that he must pay whatever
equired to get the sort of man he wants. Prob-
this will be not less than $125 a month. How-
, there are so few men capable of undertaking
sponsibility of this kind, who are in the market
ll, that the individual bargaining becomes the
n factor. It would seem to me that he would be
to find some young man who is interested in Holstein cattle and knows something about the care of pure-breds, but who lacks the capital for going ahead on his own account. Such a man as this might be started on the share basis and the prospects of satisfaction and success made much greater than is likely to be the case with a hired manager. One instance of this kind out in Iowa resulted in developing one of the finest herds of Holsteins in the state. Of course, much depends on the owner's knowledge of the project he is going into, the frequency of his visits to the farm, and the amount of energy which he can put into the management himself.

"As to the wages of men to work under the foreman, all that can be said is that they must pay the going wages of the community. I have no way of knowing how much that is at the present time."

Feeding Young Pigs

I have a bunch of thrifty pigs, 16 in number, that are eight weeks old. I have plenty of skimmilk and corn. Corn is $2.50 per hundred; middlings $37 per ton; oil meal, $60; and salvage barley, $32. Should I sell corn and buy some of the other feeds? Tankage is $100 per ton. Which of the above feeds should I use together and how much? How soon should I put them on the self-feeder? These pigs are very greedy fellows.
Middlebury, Ind. I. E. C.

Where there is an abundance of skimmilk and plenty of corn, it is an easy matter to grow good hogs. We would advise feeding about 3 lbs. of skimmilk to one pound of corn. It has been found in actual feeding trials that skimmilk and corn fed in this proportion produce the largest and most economical gains.

It might not be out of place to buy a few middlings to mix with the skimmilk. We would not use large amounts, but they are a little cheaper than corn and would add variety to the ration, which is never a bad thing to do.

Good barley is worth about 10% less for fattening hogs than corn. If the salvage barley, on the whole, is good, it is quite possible it would be more economical to sell the corn and buy the salvage barley at $32 per ton. This transaction would depend upon the distance the corn must be hauled and how badly the salvage barley is damaged by fire and water.

We would not think it advisable to buy tankage when there is an abundance of skimmilk, as it will furnish an adequate supply of animal protein.

The barley may be ground and placed in a self-feeder and the corn may be put there without grinding, as there is no particular advantage in grinding corn for the pig, but barley being a small hard berry makes it advisable to grind it before using.

If there is no skimmilk, then we would advise placing tankage where the hogs could partake of it at will, the same as barley or corn. Professor Evvard of Iowa has found that a pig uses pretty good sense in balancing its own ration when given an opportunity.

As soon as the pigs are weaned they may be placed on a self-feeder. For that matter, they may be given an opportunity to eat from the self-feeder before being weaned.

Feeding Cows and Calves

I am feeding the following ration to Jerseys milking 20 to 40 lbs.; hominy, 80 lbs.; ground oats, 100 lbs.; gluten, 100 lbs.; bran, 100 lbs. Do you consider it well balanced with 30 lbs. ensilage and 10 lbs. alfalfa hay? How much would you recommend feeding to cows?

What do you recommend feeding to calves 4 months and over in the way of grain?
Springfield, Mass. T. D.

The ration being fed to the cows is a very good one and we would expect it to give good returns. We would favor, however, feeding about 200 lbs. of hominy instead of 80, for the alfalfa hay supplies a liberal amount of protein and, further, the hominy is a good supplement to the hay. It would not be out of place if 300 lbs. of hominy were used, especially during the cold weather. Feed one pound of this mixture for each 3½ lbs. of milk produced.

It may be said that if the cows were accustomed to more than this, it would not be advisable to reduce their allowance, especially if they have established their milk flows. Any change in the system of feeding, even though it is from a poorer to a better one, should be done gradually and the time to adjust the relation between the grain and roughage is when the cow is fresh. Cows can be trained to do considerably more on good roughage than they have been accustomed to in our country, but if they have been fed heavier than we suggest and the cows are doing well, it is doubtful whether any large change in their feeds is advisable at the present time.

A very good grain mixture for calves is a combination of equal parts by weight of bran, shell corn, and whole oats, and when the calf becomes six months of age, it may be given the same mixture as is provided for the herd; or feed a mixture of equal parts by weight of bran, corn, and oats, but have the oats and corn ground. We would also give the calves an opportunity to eat all the alfalfa hay they care for, beginning with a small allowance at first, as they are apt to eat too much at the beginning and alfalfa hay will cause them to scour. The finer portions of silage are also good to give to the calves.

Dividing Silage in Silo

Our silo is 18 ft. inside diameter by 50 ft. high. The ensilage (settled to date) from corn nicely dented and just right for good silage, is 24½ ft. 6 in. from top of seal to bottom in silo. It is owned jointly, half and half, by landlord and tenant. Tenant's share is for sale, but landlord will neither sell his share with tenant nor buy tenant's share. How many feet in depth from top of seal shall the tenant go to get half of the ensilage, both parties knowing that the lower half of ensilage is much heavier than upper half? Should the purchaser of the upper half lose all of the top or seal or should he have half of the depth of the seal from the lower half to reimburse him for a part of the seal?
Kersey, Colo. G. W. H.

A silo 18 feet in diameter and filled to a settled depth of 24½ feet will contain approximately 113 tons. The upper 15 feet will weigh approximately 57 tons and the lower 9½ feet will weigh approximately 56 tons.

The seal (spoiled silage) belongs to the owner and tenant, half and half. Therefore, the whole of it should not be included in the tenant's share. This division cannot be made by taking a like depth from the lower part of the silo as this would not give accurate division. The better way is to compute the total depth of the good silage and then make the division, which we apprehend may be nearly correct by allowing the owner to retain 9½ feet at the bottom.

Sugar Beet Tops

Please tell me what feeding value there is in sugar beet tops if fed green.
Waukesha, Wis. W. J. M.

The following concerning the value of beet tops is taken from "Feeds and Feeding" by Henry & Morrison:

"At harvest an acre of sugar beets will usually yield about four tons of fresh leaves and one ton of the severed upper portion of the roots. The leaves have about half the feeding value of the roots. These tops, freed from soil as much as possible by shaking, may be fed fresh or ensiled. As fresh or ensiled leaves tend to purge the animals, they should always be fed in a limited way with such dried roughages as corn stover, straw, or hay. When large allowances of leaves are fed, Kellner advises giving about 3 ounces of chalk or ground limestone to every 100 lbs. of leaves, to counteract the effect of the oxalic acid which the leaves contain, and which may otherwise be injurious. The tops may be ensiled in pits or silos in alternate layers with straw or may be mixed with cut dry corn fodder or stover. German farmers add 7 lbs. of salt to each ton of leaves as they are ensiled."

Cabbage Leaves for Silage

As a subscriber of your journal and for the general benefit of farmers owning silos in this section, will you please give us what availabl data you can regarding the possible use of cabbage tops for silage? There are several large canning companies in this vicinity and heretofore cabbage tops have been wasted. We understand that the term "cabbage tops" applies to the outside leaves of the head.
Ogden, Utah. I. C. C.

We have no reliable information upon the ensiling of cabbage leaves. It is our opinion that the cabbage leaves will not make a good grade of silage owing to their high water content. Rape, which is somewhat similar in composition, has not been found satisfactory even when ensiled in connection with straw or some other material which would take up the excess water. However, this supposition is purely theoretical.

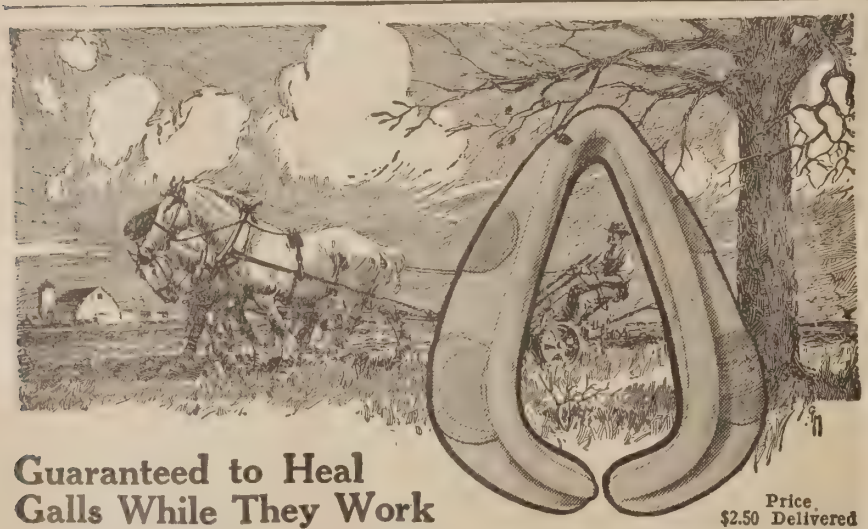
If any of our readers have attempted ensiling cabbage leaves, rape, kale, or similar crops, or have any information on this subject, we would be pleased to have them write us.

Help Your Men to Like Their Work

IT is difficult to keep farm hands on the farm. Although much comparative wage data has been put forth as the reason for this, the real cause lies in the petty annoyances farm workers repeatedly have to fret about.

Do your men spend hours each morning milking by hand? Do they come back from work in the field to again meet this tedious task? Run your dairy so that it pays and your men like their work.

The Burrell Milking system will enable one man with two Burrell Milkers to do the work of three men who milk by hand. Because of its few parts and the simple way it is made, the Burrell Milker is easily kept clean. This makes it especially desirable where certified milk is handled. The method by which the Burrell Milker milks the cow is a more natural one than by hand. The Burrell Milker eliminates every chance of injury to the cow or spoilage to the milk.



D. H. Burrell and Company have been making milkers since the introduction of automatic milking machines into this country. The present Burrell Milker is the result of over 50 years' experimentation and use. The Burrell (B-L-K) Milker has outgrown the stage of theory—it is a practical, efficient machine. It has reached the same plane of development as an automatic milker, that a high-priced automobile has as a vehicle.

If you milk twenty or more cows send for the Burrell booklets. They contain interesting facts on modern dairy methods; they will show you how to increase your profits.

D. H. BURRELL & CO., 501 Albany St., Little Falls, N. Y.

Makers of "Simplex" Cream Separators and other "Simplex" Specialties

THE BEST IN THE WORLD.

Guaranteed to Heal Galls While They Work

Price $2.50 Delivered

Sweat and chafing cause galls. Make a horse collar that will absorb sweat—move with the shoulder muscles, instead of chafing against them—and you have a collar that puts an end to galls. That's just what has been accomplished in the

Lankford HUMANE HORSE COLLAR

Absorbs Sweat

Made of closely woven army duck—stuffed with soft, springy cotton fiber.. This fiber does not hold heat. It absorbs sweat and impurities from sores. Keeps shoulders dry, cool and free from irritation.

Open at the Throat

The open throat makes the Langford conform itself to the shoulders—gives pulling muscles full play—moves with the shoulders, instead of rubbing and chafing against them.

Easy to put on. Will not pack or harden. Cannot sweeney. Often last three or more seasons. Costs one-fourth as much as leather. A collar and pad combined.

Try this open-throated cotton collar. Use it on the horse with sorest shoulders. If it fails to heal, return collar and get your money back. If your dealer cannot supply you, send $2.50, state size, and we will send you a collar, charges prepaid. (6-2c)

New York Federal Food Board Drops Milk Price Fixing

HOARD'S DAIRYMAN:—The New York Federal Food Board will no longer take part in the consideration of prices for liquid milk in New York City. The announcement was made to the trade press this week at a conference of the milk producers and distributors held in the office of the Federal Food Board. It was explained that the action was based on a declaration by the United States Food Administration at Washington, D. C., that in view of the armistice there would be no further need for federal control of liquid milk, in this or any other state, and that the matter would be left to the local authorities. The conference had been called to fix prices for January, but after the announcement of the Federal Food Board no action was taken by the milk producers and distributors.

John Mitchell, chairman of the Federal Food Board, and Arthur Williams, Federal Administrator for New York City, said that the Board had received no suggestion from either the milk producers or distributors of any proposal to increase the price of milk for the month of January, and added that, "it is hoped that soon thereafter the price will show material reductions with an increased flow and lowered cost of feeding, following the practice of former years."

Representatives of the milk producers at the conference were: Roswell D. Cooper, president of the Dairymen's League; Albert Manning, secretary of the League; F. H. Thompson, M. Eastman, and J. D. Miller, counsel for the League. The distributors were represented by I. Elkin Nathans, secretary of the New York Milk Conference Board; G. Scudder of the Milk Conference Board; and H. Van Bomel of the Sheffield Farms Company.

The milk inquiry being conducted by the district attorney's office before Chief City Magistrate McAdoo was resumed yesterday afternoon. I. Elkin Nathans was the only witness examined by District Attorney John T. Dooling, who is conducting the investigation.

It was stated at the Federal Food Board office that Mayor Hylan of New York City probably would now take up milk prices and at the mayor's office later it was said that the Mayor had taken notice of the action of the Food Board and would prepare a statement.

New York. A. H. KOLBE.

654,375 Holsteins Recorded

Volume 38 of the Holstein-Friesian Herd Book is off the press and ready for delivery. It contains a record of all pure-bred Holstein-Friesian cattle approved and admitted for entry since the close of Volume 37. The registrations include bulls numbering from 216626 to 230705, and cows from 391506 to 423670—a total of 14080 males and 32165 females recorded between September 1, 1917 and February 26, 1918. The grand total registrations of Holstein-Friesian cattle recorded in the Herd Books to date reach 654375, with Volume 39 in course of preparation.

Volume 38 contains a complete record of animals registered, their age, sire and dam, also their breeders and owners. The price charged for the Herd Book—$2.75 delivered—is much below the actual cost of compilation, and every owner of pure-bred Holstein cattle should avail himself of the opportunity to obtain a copy by ordering one immediately from the office of The Holstein-Friesian Association of America, Brattleboro, Vt.

Put this Mixer On YOUR Farm

You can save many times the cost of a Sheldon Farm Concrete Mixer on a few small jobs. What is more, you can do the work when you please, in otherwise idle time. It is made especially for farm use, and will handle large jobs as well as small. With a Sheldon Mixer you can, at lowest possible cost,

Build Your Own Concrete Feeding Floors, Foundations, Walks Posts, Tanks, Etc.

Sheldon Mixers mix 3 cubic feet at a batch; have continuous chain drive; tight and loose pulley; self-tilting discharge; easy-dumping lever; sand-proof bearings. No other mixer excels its quality of work. No other mixer approaches its wonderfully low price.

Send for FREE Catalog Today

My catalog fully describes all types of Sheldon Mixers. It tells you how you can build a Sheldon Mixer yourself, too. It gives my remarkably low prices and tells you a lot you ought to know about concrete work. It is FREE. Get your copy today. A postal will bring it.

Tells how to plan and
equip a Dairy Barn

rom Gutter to Field with but one handling

NOW BOYS and GIRLS DO MEN'S WORK- With James Equipment

Throughout this land upon the farms, thousands of boys and girls have taken upon themselves the work of men who are at war. Boys too young to don their country's uniform, girls too young for army nurses, have put on overalls to serve the nation.
In dairy barns they milk, clean the stable, feed and water cows—do work that before the war none would ask of children so young.

But in the barns that are James Equipped the task is not too great for children's strength; for James Equipment makes barn work easy. The easy running James Carriers make chore time almost play time, turning a disagreeable, dirty task into a near pleasure.

The James Carrier makes a boy's job of what used to be shirked by all and is an investment that pays a profit of 25% or more a year in labor saved.

James Scrapers make quick work of cleaning up cement floors; the James Stanchions keep stalls and cows clean, by lining up cows at the rear, so that manure falls in the gutter and not on the standing platform; and the James Swinging Sure-stop saves time and trouble.

The James Feed Truck or Feed Carrier saves much walking to and from feed rooms,—makes unnecessary the lifting of heavy baskets of feed.

James Drinking Cups

not only save time—cows have fresh water before them day and night—but they do away with the nuisance of tending bothersome tank heaters in blizzardy weather; save fuel expense; and on top of that increase milk yields.

Drinking cups earn 200% and more a year on their cost.

And so with other James Equipment—stalls, steel pens for cows, calves and bulls, ventilators, bull staffs, mangers and swinging cranes.

Free Book

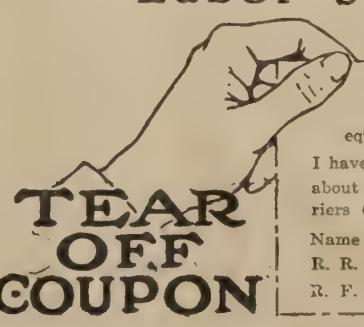
The 320-page book "The Jamesway" tells all about these James inventions that save labor, increase milk yields, promote better cow health and prevent spread of disease, protect against dangerous bulls and make simpler the care of calves and sick cows.

Easy Installation

It explains the easy way of putting up carriers, erecting the stalls and pens, and attaching drinking cups. Skilled help is not required.

Barn Plan Service

It tells about the James barn plan service; the James barn experts who know what has been successful and what has not; what not to do as well as what to do in planning convenient, money saving barns.



Their advice on barn planning, ventilation and other barn problems is free. No charge for floor plans.

Let James Equipment solve your labor problem. Send for the book—mail the coupon now—get full details of how you can cut barn work in half and make more milk.

Country Hide

Packer Hide

Good hides make your cattle worth more money

Leather tanners are very careful about the hides they buy.

They want hides that are as nearly perfect as possible — hides that are without cuts and scores, and that are properly cured.

There are two classes of hides on the market—"country hides" and "packer hides."

Country hides are those taken off by small butchers and farmers. Packer hides are those taken off by the packers.

* * *

To take a hide off correctly is not easy. Unless great skill is used the hide will be marred by cuts and scores.

The packers have made a careful study of hides. They have trained experts who do nothing else but take them off. Hence, packer hides have few cuts and scores, and are uniformly and properly cured.

Swift & Company sorts its cured hides into grades or classes, according to quality and to the purposes for which they are best adapted.

Some country hides are good; others are very poor.

They usually have cuts and scores and are not cured so well. Some have also begun to deteriorate because of being held too long. Besides, they cannot be graded so uniformly. In the same batch there are both good and poor hides.

Because of this superiority of packer hides, tanners pay from two to five cents a pound more for them. If country hides were as good, tanners would gladly pay an equal price.

This increased value of packer hides means that you get for your cattle from $1 to $3 or more per head, additional.

Swift & Company does not deal in country hides at all, and has no interest in their purchase or sale. It is the hide dealers and tanners who notice the difference in quality, and pay accordingly.

Swift & Company uses skill in taking off hides, not because it wants to see country hides bring lower prices—but because it is part of its policy to produce articles of the highest quality.

* * *

This is only one way the packer has increased the value of your cattle. Many other by-products have been improved in a similar way.

Swift & Company is constantly on the lookout for new ways to improve the value of its products, and hence to make your cattle worth more money to you.

When Swift & Company says that its profit on beef averages ¼ of a cent a pound, this includes the profit from the sale of hides.

Swift & Company, U.S.A.

A nation-wide organization owned by more than 23,000 stockholders

Feed Thy Cows

(Continued from first page.)

reacts, and by encouraging grea milk production when she does not ceive a greater supply of food, body makes up the difference, so t by the end of the grass season—e a good grass season—her body weaker than in the spring. Then dairyman is up against the prop tion of building her up during cold winter months, and receivin greatly reduced milk flow while ing it.

Honestly, I believe this one faul pasturing all summer without sup menting feeds is one of the grea sins of the dairyman and the th more than all others responsible decreased milk and butterfat proc tion. I speak from an experience my own.

In 1917 I fed my cows until J 10, and, like my neighbors, gave th pasture alone until September when their steadily decreasing m flow made me hurry feed shipme But even then the damage was d and the decrease continued until t to dry them. This year I decide continue the grain feed throug the summer, and the same cows, ing calved at nearly the same t last year, are giving now over 4 more milk than the season bef Some credit must be given to the proved pasturage conditions this y but to my mind the biggest reaso the feed they got the past sum is now giving results. And extra 40% is more than making g the feed the cows ate.

But feed short in quantity is worse than feed short in quality. man who thinks he can winter a of dairy cows on a ration of fodder or hay and bran, is lackin the knowledge necessary for his cess. This is a business that calls brains and study as much as any ness a man may enter. The prol of percentage of protein, carb drates, and fat needed to produ certain quantity of milk in a co a determined weight must be sc if the dairyman is to produce mi a profit. It is a problem that man of intelligence and an ur standing of the first principle arithmetic can solve. Tables of analyses of feeds are at the dis of every one, and the feed req ments of a cow for the milk she duces are closely known. It req only a few simple processes to out a balanced ration in both qua and quality that will insure each on the place having a fair trial giving the maximum amount her tem is capable of producing.

That is the answer to the adm tion of "Feed thy cows".

Boys Teach Fathers Better Raising

Some of the boys in the two De County, Ind., pig clubs are sho their fathers how rapid and eco cal gains can be made in raising Under the direction of the local ty agent these boys have been to almost double the results obt by their fathers within the length of time and feeding pigs same litter. The boys used self- ers and the fathers did not, an pigs which were allowed to their own feed made gains of 2 day. The club members are pro beyond question, the merits of self-feeder, and hog raisers in county of many years' experienc beginning to copy the boys' met As a result of the club work county agent reports, many fa and sons are now planning to g partnership and raise pure-bred —Weekly News Letter.

"BEATS ANYTHING FOR CULTIVATING I EVER SAW"

"There is nothing that will beat the Moline-Universal Tractor. It will work wherever hitched. For plowing and discing it is fine; beats anything I ever saw for cultivating, just the thing for the binder and one man can handle all." Thus A. C. Paul of Middletown, Ohio, sums up in a few terse words the great advantages of his Moline-Universal Tractor.

This is not the opinion of just one exceptional individual, but is a typical expression of Moline-Universal owners.

Before designing the Moline-Universal Tractor, as manufacturers of farm implements, we knew a tractor would be of little value to the majority of farmers of the United States unless it would cultivate row crops. If a farmer is forced to keep his full number of horses for cultivating there is small economy in owning a tractor. Therefore the Moline-Universal was designed to cultivate as well as do all other work. We reproduce a few expressions from Moline-Universal owners to show just how well it has succeeded in cultivating and what bearing the cultivating feature has had on their farming operations as a whole.

It's Easy and Practical

"I was agreeably surprised at the ease with which we could cultivate corn with the Moline-Universal," says Miles Kinnick of Adel, Iowa. This is the usual expression from every one who has used the Moline-Universal for cultivating.

The Moline-Universal Tractor straddles the corn row and has as much clearance as the ordinary cultivator, so corn can be cultivated in all stages of growth. The tractor is attached to the cultivator and forms one complete unit—the tractor the front wheels and the cultivator the rear wheels. The operator sits on the cultivator on line with the right drive wheel of the tractor, where he has a clear, unobstructed view of the row ahead. This is of the utmost importance for good work.

In cultivating, you follow the same rows as planted by a two-row planter. As hills in these rows are exactly the same distance apart, only one row need be watched.

The Tractor is easily held to its position, and by keeping the right drive wheel, which is in line with the operator's eyes, a certain distance from the outside corn row, the only other attention the outfit needs is an occasional shifting of the gangs by the operator's feet.

The cultivator is extra heavy and holds to its work when the cultivator gangs are shifted. The electrical governor control within easy reach of the operator enables the tractor to be slowed down to as low as one-half mile per hour.

Injures Less Corn Than Horses

By using care in turning at the ends of the rows less corn will be injured than with horses.

"I have often, without hesitation, angled into position and proceeded toward the other end of the field without hitting a hill," says W. A. Marker of Van Wert, Ohio, who owns a Moline-Universal cultivating outfit and farmed 80 acres with it, living in town 8 miles away, devoting part of his time to other work. He goes on to say: "Practice soon will make you expert if you will but consistently study the game."

"This cultivator, I feel, more than paid for itself the first season through increased yield due to timely cultivation."

Harley A. Mishler of South Whitley, Ind., farms 185 acres. The Moline-Universal enabled him to dispose of four horses. He says: "For cultivating a Moline-Universal Tractor is better than horses a dozen times. It is steady, and stands the hot weather. It does not stop and switch flies but goes fast or slow just to please you."

* * *

C. R. Barr of Wyaconda, Mo., last summer had 130 acres in corn and 75 acres in oats and wheat. Since using the Moline-Universal he keeps only one team of horses. He used the Moline-Universal for cultivating and says: "I don't think we could farm again without the Moline."

* * *

Ed. Finnegan of Bradford, Ill., says: "I cultivated and tended, from the time corn came up until it was laid by, 80 acres of corn. In going over the corn for the first time you can throttle the motor down slow and not cover up any hills. After I bought my Moline-Universal I rented 35 acres more ground and the crops from this extra land paid for my tractor."

* * *

Another remarkable instance is furnished by E. E. Fletcher of Krum, Texas, who farms 500 acres—100 in cotton—and all the work is done by two Moline-Universals—not a single horse is used.

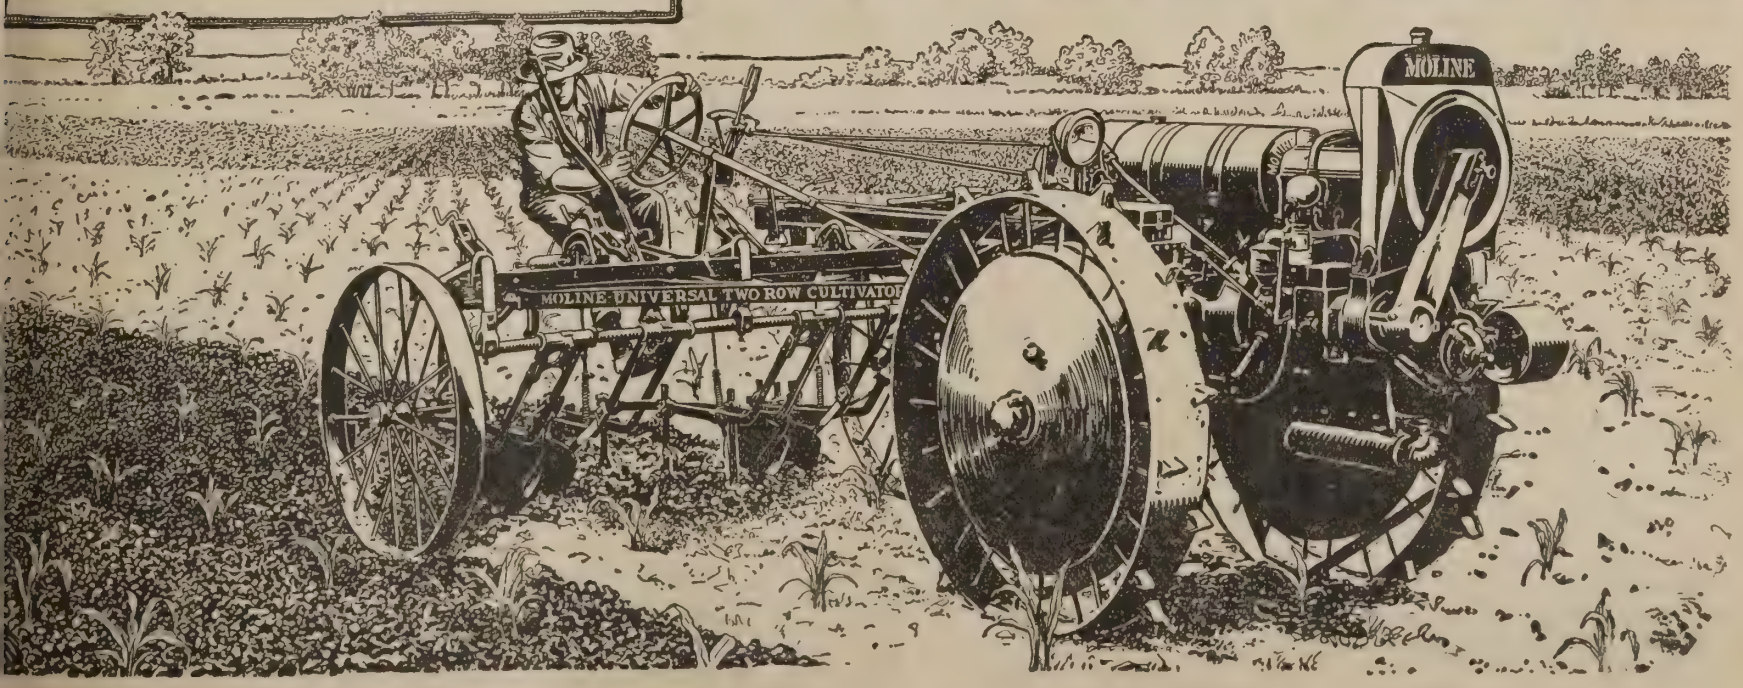
Even on the small farm the Moline-Universal is a profitable investment. Mr. Edward Belshas, Framingham Center, Mass., who farms 73 acres, says, "the Moline-Universal saved a whole lot of time, as 20 per cent tractor field work was spent in cultivating."

* * *

Fred Pabst of Oconomowoc, Wis., farms 1400 acres. He used his Moline-Universal for a great variety of work including cultivating and says: "That the tractor was satisfactory is indicated by the fact that we ordered a second one during the summer."

* * *

Chris. Walker of Blythe, Cal., raised 80 acres of cotton without a single horse. He says: "I think the Moline-Universal is the only tractor built that is practical for general farm work on account of its ability to cultivate. I would not farm in this country without a tractor, and it is needless to say that the tractor is a Moline."



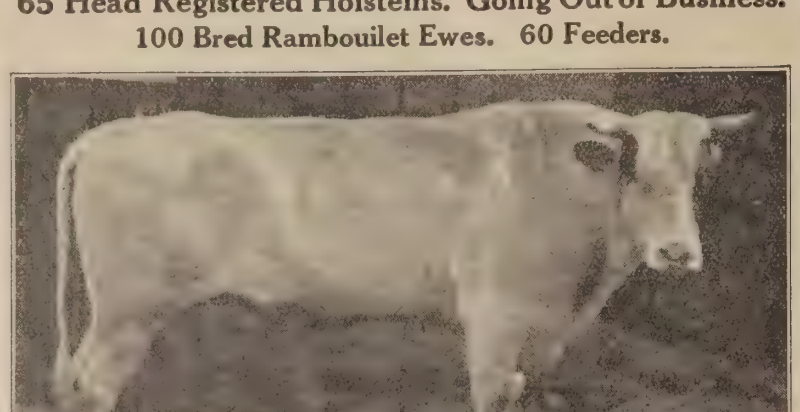
* * *

Remember the Moline-Universal does all farm work including cultivating and one man operates both tractor and implement.

Our tractor catalog gives full information. Write for free copy and name of your nearest Moline dealer. Address Dept. 18

Moline Plow Co., Moline, Illinois

MOLINE UNIVERSAL TRACTOR



Complete Dispersion

of the Pure-bred Holstein Herd, owned by Edward C. Waller, Jr., at Cary Station, Ill.

Wednesday, Jan. 15th, 1919

65 Head Registered Holsteins. Going Out of Business.
100 Bred Rambouilet Ewes. 60 Feeders.

A fine Herd of Young Cattle, Healthy, Tuberculin Tested, Well Bred and Good Individuals.
Composed chiefly of first or second calf heifers, fine, strapping individuals, some of them Real Prizes. Five daughters of King Segis Pontiac and a number of daughters of Woodcrest Pietje Clyde, whose two-yr.-old daughters are making him famous.
Practically all these heifers fresh, or soon to be.
Sr. Herd Sire, King Segis Golden Bell, a 36-lb. 3-yr.-old grandson of King Segis. (See Picture.)
Jr. Herd Sire, K. K. S. V. Concordia Pontiac, a Yearling son of the mighty King Korndyke Sadie Vale. The first three dams of the dam of this bull average nearly 33 lbs. Absolute Dispersal. Nothing Reserved. Sale begins at 10:30 A. M. Wednesday, January 15, 1919, on the old Burton or Tiffany Farm near Cary Station, Illinois. Sale will be in comfortable building, and conveyances will meet all trains at Cary Station and Crystal Lake. For Catalog or other information write

F. H. Everson, Sale Mgr., Lake Mills, Wis.

Auctioneers: Haeger & Mack. S. T. Wood in the Box.

Entire Crop of 1918 Holstein Heifers

FOR SALE

Will offer for quick sale my entire lot of 11 heifer calves and a 25-lb. bull, from 6 mos. to a year old. All but two are sired by a 31.50-lb. bull and all but three are from dams with records from 20 lbs. at 2 yrs. to 24.60. 7 of the grandams have from 20 to 29 lbs. These heifers are well grown, splendid individuals, mostly light colored, and from exceptionally large cows and from the best blood lines of the breed.

Offer Two Bulls Just Ready For Service

Both have Semi-Official dams. They are sired by M. M. Mercedes Mechthilde Homestead who carries the blood of Jessie Fobes Bessie Homestead and is closely related to Duchess Skylark Ormsby. No. 1 Dam has a record of 710 lbs. butter in 365 days at five years old. No. 2 Dam has record of 527 lbs. butter in 365 days at 2 years of age. These calves are fine individuals and are good enough to head any herd. Write for prices and pedigrees.

WHITEHURST FARM, Canton, Ill. A. F. Randolph, Prop.

OLD DEERFIELD HERD

FOR SALE—Young Holstein Bulls, 2 to 4 mo. old. Sired by King Piebe Korndyke Johanna No. 210878. Price $45 to $50 Registered, transferred F. O. B. cars my station. Herd tuberculin tested.

CARL FOLL. R. F. D. DEERFIELD, WIS.

FOR SALE

Holstein Bull Born May 17, 1916, a son of a bull whose two nearest Dams average 38.72 lbs. in 7 days. Dam 15.16 lbs. at 26 months, Daughter of King Walker, a 30-lb. Sire. Sire of a heifer who broke the seven and 30-day butter records for a heifer with first calf. Bull straight individual, more white than black, and sires calves likewise. Price $200.

H. H. WHITTEN, IRVING, ILLINOIS.

WANTED!

We want several high grade men, preferably Dairy School graduates inclined toward the mechanical side of the milk business. Must be in good health and not afraid of hard work.
To such men we offer a three months' course of instruction, with pay,—in our factories, and if qualified, a position as traveling Erecting Engineer. Applications must be in own hand writing and give full particulars.

Address—Operating Dept. C, 122 Morgan Street, Jersey City, New Jersey.

Grimm Alfalfa Seed

NON-IRRIGATED

Superior in Hardiness and Yield.

My farms are devoted exclusively to the production of genuine non-Irrigated Grimm Alfalfa Seed. No other crops are produced.
My seed is grown on my own farms, near Benkelman, Duncy County, Nebraska, under my personal supervision; is shipped in double sacks, sealed, and a sworn Certificate is furnished guaranteeing the seed to be Genuine non-Irrigated Grimm. True Grimm Seed will be difficult to procure later in the season. Write for circular.

Henderson's Alfalfa Seed Farms, Benkelman, Nebraska. Stonewall J. Henderson, Prop.

GUERNSEY BREEDER'S JOURNAL

Indespensable toall interested in Guernseys or improving their herds of dairy stock. Well gotten up. Full of pertinent facts. Giving latest records of production. With Hoard's Dairyman 1 year, $2.75.

Send for sample copy.

GUERNSEY BREEDER'S JOURNAL, Peterboro, New Hampshire.

Small Quantity of Hay on Hand

Please balance a ration of the following feeds: Barley, $1 per bu.; oats, $.70; oil meal, $65 per ton; gluten, $57; bran, $35. I have corn, silage, good oat straw, and some mixed clover and timothy hay for roughage. Not enough hay to feed very heavily. I also have about six tons alfalfa hay which I intend to feed in April and May. Will it be better to buy alfalfa hay at $36 per ton than bran at $35 to feed with the silage? Cows give a moderate flow of milk.

Hartford, Wis. A. C. E.

Since there is not enough hay to feed it liberally during the winter, or, at least, until grass comes, it would be our suggestion that some alfalfa hay be fed to each cow, even though it isn't more than two or three pounds daily. Then, feed some of the mixed hay, trying to proportion the two hays so that they will last until the cows are turned to grass. In view of the shortage of hay, we would advise using more silage, say 35 to 40 lbs. daily per cow, and if possible to get along without it, we would not feed any of the straw. Straw is not very nourishing. It helps to fill up the cow, and we sometimes think it interferes with her digestion of good feeds. However, in the absence of an adequate supply of other roughage, it would be better to feed straw than to have the cows hungry for roughage.

A mixture consisting of 300 lbs. ground barley, 300 lbs. gluten feed, and 200 lbs. bran would supplement the roughage very nicely; that is, especially for the rather moderate milking cow giving 18 to 22 lbs. a day. We would feed about 1 lb. of the mixture for each 3 lbs. of milk produced. To cows giving more than 21 or 22 lbs., we would feed one-half pound of oil meal daily, and to much heavier milking cows would feed about one pound of oil meal daily. It would not be out of place if all of the cows had a little oil meal, and it is quite possible it would bring a return, even though it was not shown directly in the milk pail.

We would not advise buying alfalfa at $36 a ton when bran can be purchased at $35 a ton. From experiments conducted, it was shown that alfalfa was quite equal to bran, but in such experiments it must be borne in mind that the alfalfa was exceptionally good. However, the average alfalfa hay would not be worth as much as bran for feed.

When writing advertisers please me Hoard's Dairyman.

A Word from the Publishers of Hoard's Dairyman

FORT ATKINSON, WISCONSIN

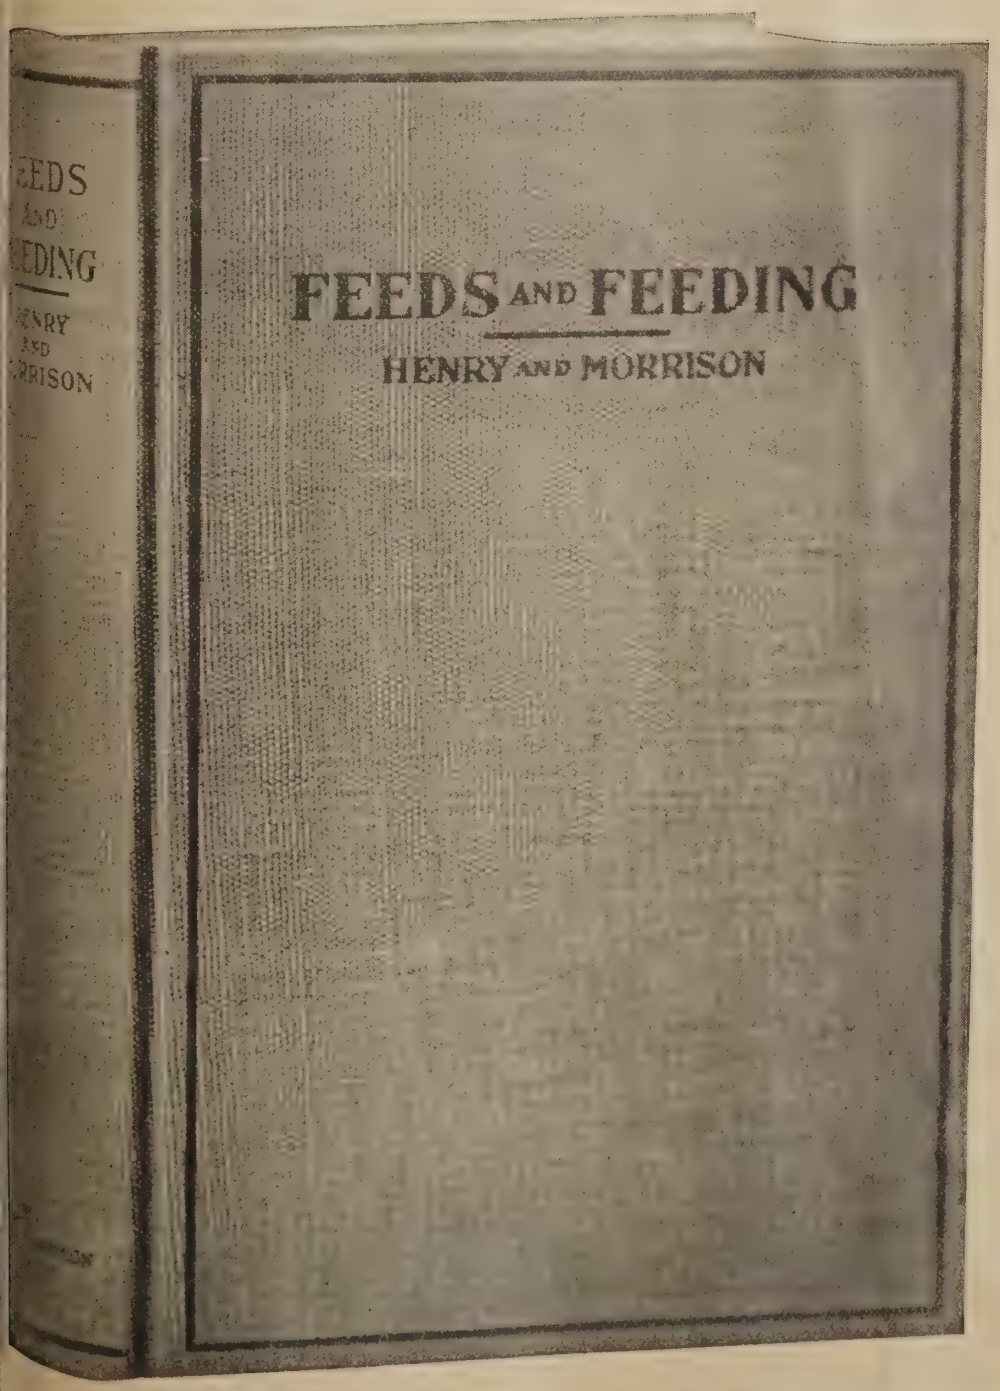
We wish it might be possible to persuade every reader of our paper to "take us up" on the offer we are making. Not alone for the extra subscriptions it would bring us—welcome as they would be! But, because we feel that every one of our readers ought—this winter—to have a copy of Henry and Morrison's wonderful book "Feeds and Feeding".

How About You, Mr. Reader?

Your milk, butter, poultry, hogs, beef—everything you sell—is today bringing a good price. You are **taking in** more money than you ever did. But are you "getting ahead" any faster? Or are you paying it right out in feed bills?

Are you **sure** you are feeding your cows the very cheapest and best ration that will keep up their milk flow and keep them healthy and thrifty?

Are you **sure** you are feeding your other stock (hogs, horses, etc.) as economically as possible?



Don't guess! Not this winter!

If there ever was or ever will be a time when it would pay you in dollars and cents to look into the whys and wherefores of the feeding business—to find out what science and practical experience have discovered about the feeding of dairy cows, hogs, horses, etc.—that time is **now!**

"Feeds and Feeding" is a 691-page volume. It represents the life work of many men. It was first written and published by W. A. Henry, formerly Dean of the Wisconsin College of Agriculture. He devoted the best of his years to gathering, testing and putting into usable form all that men have ever learned about the feeds for, and the feeding of domestic animals. And the best of it all, is that the book is perfectly indexed. Within a few minutes time—and no trouble at all—you can find out **all** about any problem in feeding.

In times like these, the wealth of information this book contains, and the fact that anyone who reads the English language can understand and use that information, makes Henry and Morrison's "Feeds and Feeding" almost priceless.

Get a copy—**now**—of "Feeds and Feeding". Plan to spend a few minutes during each of these long winter evenings studying it. "Square up" **your** feeding practices with what you learn. And we'll promise you that the "high cost of feeds" will be less of a "bug-a-boo" to you than it is now!

OUR OFFER

The price of this book is $2.50. You can't **buy** a copy anywhere for less than that. But we will send you a copy—without any charge, and postage paid—if you will do us a little favor that will take very little of your time. **Send us just four yearly subscriptions to HOARD'S DAIRYMAN at $1.00 each.** They may be either new or renewal subscriptions—and your own renewal may be included in the club. But, your own renewal does not count unless accompanied by three others.

Here's a real chance to put this encyclopedia of feeding on your reading table—without cost—and at the same time to give a few of your neighbors a "lift" along the road to bigger dairy profits!

USE THIS COUPON

Or—if you don't like to cut up your copy of HOARD'S DAIRYMAN—write about the same thing in a letter—

HOARD'S DAIRYMAN,
Fort Atkinson, Wis.

Enclosed is remittance of $4.00. Send me a copy of the latest edition of "Feeds and Feeding".

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Achievement Boys

Bob Ramsey, our champion corn grower, is an Achievement Boy. He wears the Achievement Badge, a picture of which is seen on this page. We want all of our American boys to wear this button of honor, but in order to do so each must do something —achieve some results that will make him worthy of it.

Bob earned his button in the corn club contest. To him it means a great deal. He was able to do something better than anybody else who tried to do the same thing. He is proud of it and he is always seen wearing his badge. He is an honor boy in America's great nobility of young people. Other boys are wearing them, too, for they have won honors either in calf, pig, or poultry clubs.

Bob told me all about the meaning of the button and what everything on it stood for. It pleased me so that I want all of the boys and girls, too, to know about it. It's a capital idea and we want Hoard's Dairyman Juniors to all get into the class of Honor Boys. "You see", said Bob, "in order to be an Honor Boy, you must first join some boys' club and pledge to work as one of its members. There are lots of clubs to join. It all depends upon what you are interested in. I got interested in corn first and that is why I joined a corn club. Some of the boys belong to a calf club, some to a pig club, or a sheep club, and others to a poultry club. You can join any of them; they are open to all farm boys.

"When I entered the corn contest work I started out to raise the largest crop of corn on an acre, and I did it. So they gave men an Achievement Button. I am awful proud of it. It shows that I belong to a great national fraternity of workers in which we learn to do things.

"Joe Peters wears a button, too. He raised the best calf of anybody in the calf club last year. I have just joined that club and I already have my calf picked out. Gee! she's a dandy calf. She is a Holstein and I bought her with some of the money I earned from my corn. I told Joe yesterday that he would have hard work from now on holding the championship of the boys in that club. I guess he is getting a little afraid of being beaten, too, because he told me that his father was going to buy him the best calf he could find to raise for this year's contest. That doesn't worry me very much though. I'll take my chances on Betsey with the judges when the day comes for our show. She looks better every day. It's such fun to take care of her."

"But, Bob," I interrupted, "I thought you started to tell me about your Honor Button and what it stands for."

"Oh, that's so; I am glad you reminded me of that. I get so excited when anybody asks me about my club work, that I forget everything else. Guess I am too interested in it. But some day I am going to tell you how I take care of Betsey.

"Now about my Achievement Button. First of all, only those who get certain results in club work can wear the button. We have some rules that govern all of the work in the clubs, and unless we live up to them and produce the goods our chances are not very good for coming out on top. We are called Achievement Boys because we do things. I think that is a good word to have on the button. It kind a lets other people know that you are worth your salt. It meant a lot of hard work to earn that honor, but I learned so much, and had such a lot of fun doing the work. You see, everything was my own.

"I made quite a little money too. Do you know that I am figuring on making enough money in this club work to pay for my own college education, when I get through high school? I am planning on going to our state agricultural college some day. Of course, I am always going to stick to farming, but an agricultural education will make me the best kind of a farmer.

"Did you notice the three words on the lower edge of the button? They mean that the boys are training for state, home, and school. Our teacher told us that the most useful life one can live is one of service. You see in this work we are serving as useful citizens. Everything we do adds to the wealth of our state. It makes us like better homes and good schools."

"I wonder why the word home is printed on the open book shown in the achievement badge," I asked."Oh, I guess that means," replied Bob, "that we can learn a great deal from reading good books and that they should be in every home.

THE HONOR BADGE FOR CLUB WORKERS.

We generally have a reading hour in our home every evening. Sometimes mother reads out loud to father and me. I always read the junior page of Hoard's Dairyman out loud and then father and I talk things over. They tell us fellows a lot of good things on that page.

"Those four letter H's stamped upon a four leaf clover in the center of the button stand for lots in this work. Kind a funny that four words each beginning with H should fit in here so well.

"The first one stands for head. It means training the mind. By thinking out all of our own plans and doing our own work, our minds grow and become trained. You've got to use your head if you want to come out on top.

"Health is what the second H means. You can't have a good working head unless your health is sound. Our work exercises both mind and body and keeps us healthy and contented. Health is one thing you can't buy. You've just got to take care of it by living right, and work helps one to do that.

"If you set out to succeed,—well, that just means your whole heart and soul have got to go into your work, and that is what the third H stands for,—Heart. That's how I won out in the corn contest last year. Interrupting him I said: "Don't you think it could stand for kindness, too?" "Well," Bob answered, "I hadn't thought so much about that. But I guess you are right. I know that I don't like to see anybody cruel to stock. I wouldn't whip my calf for anything. It doesn't do any good; they don't know any better.

"We use our hands as well as our heads. The last H stands for Hand. You surely learn to use your hands in this club work. Then I guess it means lending a helping hand to others too. Our clubs pull together and that is why we do so much. We believe in what Rudyard Kipling said:

'It ain't the guns nor armament, nor funds that they can pay,
But the close co-operation that makes them win the day;
It ain't the individual nor the army as a whole,
But the everlastin' teamwork of every bloomin' soul.'

"I think President Wilson hit the nail on the head when he said, 'the only patent to nobility in modern times is achievement'. He meant that the only nobility worth while nowdays are the working people, those who devote their lives to achieving things of value to everybody."

"Yes, sir, Bob, that's exactly what he meant, and Abraham Lincoln once said something that I have always remembered. Your club members all should know it. He said, 'I do the very best I know how, the very best I can; and I mean to keep on doing so until the end. If the end brings me out all right, what is said against me won't amount to anything; if the end brings me out wrong, ten angels swearing I was right would make no difference.' "

Junior Letters

Hoard's Dairyman Juniors:—As I have not written to you for so long a time I though I had better write.

I have a heifer calf which my father gave me for my fourteenth birthday. On 3 lbs. of whole milk and 1 lb. of skimmilk she gained 18 lbs. in three weeks.

We are now milking 9 cows and 9 others are dry.

We have eight horses and two colts and a tractor. We would like to sell some of the horses. My father belongs to a cow testing association and we weigh our milk every night and morning.

We have two silos and had them both full but they have settled quite a lot now.

I would like to hear from some of the juniors. My address is R. R. 1, Montague, Mich.

Charles Myers.

Hoard's Dairyman Juniors:—My father has four hogs and four horses, one calf, and a cow that we milk. I have four chickens. I had a garden but it wasn't very big so I didn't get much from it.

My sisters and I go to school on the street car. I am nine years old and in the third grade.

I hope that my letter goes on the junior page. Well, I guess I will close.

Hastings, Minn. Walter Metz.

Hoard's Dairyman Juniors:—It certainly is my turn to write to the juniors. Several times I have attempted to do so but you all are well aware how easy it is to let such chances pass by.

I have been a member of the junior club for a long time and enjoy reading the junior page. Much valuable information and suggestions have I secured from this column. I have been a subscriber of the Hoard's Dairyman for a long time. I won last year's subscription for a prize.

Perhaps it will be of interest to tell about our boys' cattle judging contests, etc., which have been held at the Harford and Montrose fairs, of Susquehanna County, northeastern Pennsylvania. Many valuable prizes have been given each year for the past three years, at least first and second prizes being pure-bred Holstein calves. The first year I did not enter, yet a young boy from near my neighborhood won the prize, again another boy won last year's prize from near the same place, and this year's prize went practically to the same tion, and second prize to me, being calf. Boys, was I surprised? Indeed I

We judged the first two years by u score card and this fall by placing the in a class and choosing the best dair cow and why? Anywhere from 20 to 4 have entered each year. Also we have h growing and corn raising contests. Th are under the operation of the Farm B which is a wonderful investment fo farming county.

Hence there are many young jun would like to hear from and, too, n never too plentiful in camp as I have the S. A. T. C., of Uncle Sam where n all kinds is appreciated.

Let's hear from the juniors and I w to come again. Thank you. R. 1, S hanna, Pa.

Kenneth S. Ba

Hoard's Dairyman Juniors:—Well, d think I was dead?

School had been started a little ov month when everything was closed up count of the influenza. There are abo cases in and around Bishop.

We are only milking seven cows nov are to be fresh next month. One of ou had twin bull calves. The mother died two weeks later. We have and are seven calves.

The corn crop is not very good thi because we had so much cool weather summer. It is only about one-half the should be.

Our chickens are molting now a haven't had an egg for ever so long.

We are going to haul some hay today the fourth cutting we've had on this pi is Peruvian alfalfa. We have both P and Chilian alfalfa. The Peruvian gro or three inches higher but not so thi one piece we have both kinds and the P is about 2½ inches higher.

Well, I must close now, wishing juniors good luck.

California. Enid La

Hoard's Dairyman Juniors:—I am another pure-bred heifer calf this yea has a great deal more white on than th one. Her name is Queen Laurella Aagg cedes DeKol. I let her suck the cow u was five weeks old and then I began her milk out of a pail, then I comme put water in the milk and in four day gan to feed her calf meal and when t of calf meal was gone we got anothe I expect to feed her ensilage. You recor ed it to me for calves last winter and I to feed it to my calf and she grew fast that. We are raising three others wi My sister is raising a bull calf. He w in March 1918 and was on an old lar for five months. He grew like a weed before he was five months old we took the Orange County fair and he took prize against the breeders. He then about 600 lbs. He, too, is a pure-bred.

We are just cutting corn here. W about 30 acres of corn. It is pretty go year.

We have a new 15 H. P. kerosene eng a new cutter size L. We have one silo by 43 feet.

Good-bye juniors.

New York. Birdsey A. Yo

Hoard's Dairyman Juniors:—I am ju ting over an operation. My sister and our tonsils and adenoids removed.

Our beans are all threshed. I got te from my acre.

Our last month's milk check was from thirteen cows.

My heifer calf is growing fine. I her a few days ago. She is now abou months old.

I feed my rabbits alfalfa hay and E corn. I sometimes feed green stuff a rots. I always keep plenty of water the rabbits. I have two, two-story for them. The market for rabbits is have never had any trouble selling th

At high school they are organizing and pig clubs. I am joining the sheep am going to buy a Merino ewe for $20. enjoying my agriculture class very muc are studying the soil now.

It is nearly supper time so I will clo address is Box 136, R. B, Modesto, Ca

California. Merrill Worthin

Hoard's Dairyman Juniors:—I shou answered your letter a long time ago have not had time. My brother and I sheep. We sold 10 sheep this fall. W first started we bought 2 sheep and rowed a ram from the neighbors the fir By selling the rams and keeping the e soon had a small flock of sheep.

I have a liberty bond, war saving

LIME Never Fails to Show Profit

Fifty per cent better crops follow the use of Waukesha Agricultural Limestone. It never has failed to return its cost and at least 25 per cent more. It will do this on

Your Land—YOURS

This means that Waukesha Quality Limestone will earn fully 25 per cent on your land, no matter what the character of the soil. You can't invest the same amount of money and earn as much in any other way, as by applying Quality Limestone. Our booklet shows how to use limestone and why. It's free.

and some money in the bank, all of which I have gotten from my half of the sheep.

We are husking corn now; we are putting the stalk in the barn and will feed it to the cows this winter.

I take music lessons on the piano ever Wednesday at fifty cents a lesson.

Wishing all the juniors good luck.

Wisconsin. Kenneth Hagestad.

Hoard's Dairyman Juniors:—I hope that all the juniors are well. I am.

I have a cousin in the service.

At school football is a great sport.

I have a cow and a calf, five pigs and fifty hens and pullets. My cow is giving 27.03 lbs. of milk per day.

My pigs are doing fine. I will sell my sow and raise the pigs. The next pigs I buy will be registered stock.

I saw that war-time ration in the paper which some junior wrote. My hens are not laying good now.

My garden was a success this summer. I am putting some products in an exhibit this Monday, wishing to get a prize.

We had a fine exhibit. I won no prize but my sister won second on her cabbage.

New Hampshire. Archibald Thompson.

Hoard's Dairyman Juniors:—I have not written for a long time but I was going to school and did not get home very early. School is closed now because the Spanish influenza is going around.

We have nine little pigs and they are growing fine.

We went to Pleasant Valley Sunday afternoon and on our way we got some mistletoe from an oak tree. The hills are very pretty there.

We have a little brown pup named Twinkle.

I am going to town tomorrow and have a tooth pulled.

We are having unusually warm weather for this time of the year. The farmers are sowing their barley and wheat on the ground that was summer fallowed and are also winter plowing now. Most all work is done with tractors in Solana County.

Mamma's pullets are laying fine now. They were hatched in April. We sold all the roosters. Mamma's young gobblers are very large this year.

My sister belongs to the Hoard's Dairyman Junior Club but she never writes. My letter is getting long.

Wishing the juniors good luck.

California. Nina Van Pelt.

Hoard's Dairyman Juniors:—This is my second letter to the junior page. The first one I guess found the wastebasket. We have 16 head in our herd. They are Jerseys and grade Guernseys. The herd consists of 8 milk cows, one of which we want to sell, five heifers, two of which are imported Guernseys. They belong to my brother and me. We got them by being in the Boone County Guernsey Calf Club.

We have two old brood sows and one young one. We have one male hog and 12 shoats. All these hogs are pure-breds. We have 3 horses and 2 colts.

I hauled gravel last week. We are going to cement our calf stable.

The frost got most of our corn this year.

I wish some of the juniors would write to me. My address is R. R. 1, Kirklin, Indiana.

Paul Irwin.

Hoard's Dairyman Juniors:—It has been a long time since I wrote to the juniors. I am going to write the juniors a story of dairying.

We have a tester of our own. One day a man brought some milk to test so we tested it. He wanted to pay us so he gave me a quarter. I took the quarter and bought a setting of eggs. I set the eggs, then the eggs hatched. I raised the chickens and sold them. With the money I bought a sow which had a litter of pigs. I traded the sow and pigs for a heifer. I sold the heifer for $25, then I bought another for $25, then sold her for $30, then bought another for $25 and kept her until Oct. 7, and sold her for $100. Then I bought a $50 registered Liberty Bond and a registered Jersey heifer for $46.

Wish the juniors good luck.

Indiana. Russell Utz.

Hoard's Dairyman Juniors:—It's been a long time since I wrote to you. I enjoy reading junior letters.

I finished the country school and started in high school this fall. Last spring I joined the chicken and corn club and set 30 White Rock eggs and hatched 24 chickens. I raised 23 of them. There are 19 pullets and 4 cockerels. I took 5 of my best chickens to the fair and got $4 worth of premiums.

I have one acre of corn. The corn is fairly good considering the dry weather. We are going to begin husking it next week. We are harvesting our sugar beets now. They are pretty good. We are going to haul them to town next week. We have three old hogs and they have 26 little pigs. We have 37 pigs in all.

My oldest brother works at Edgewater Stock Farm. My other brother and myself help my father with the work. We have 27 head of cattle. We are milking 15 cows. We have 5 horses and 2 colts.

I live on a 95-acre farm 2½ miles from Fort Atkinson. I milk 4 cows every night and morning and tend to the chickens every day and gather the eggs. My brother has 12 ducks We are going to eat all of them.

My letter is getting long so I will close wishing the juniors good luck.

Wisconsin. Teddy Saur.

Direct From Factory To You

Greatest Typewriter Bargain the World Has Ever Known

Prices Smashed Nearly Half

Here is the most sensational typewriter offer ever made. And it comes from The Oliver Typewriter Company itself—the foremost maker.

We ship direct from our big factory, devoted exclusively to the manufacture and direct distribution of this wonderful Oliver. Don't send one penny. Merely send us the coupon and we ship you a brand new latest model Oliver Nine. Try it for five days. If you decide to keep it pay us $57 at the rate of $3 per month. If you don't want it, send it back. We even refund transportation charges. You cannot lose a cent.

FREE TRIAL

We ship this brand new Oliver to you for five days absolute free trial. No money down—No bank deposit. Be your own salesman and save $43. The most wonderful offer ever made.

Learn Typewriting at Home

This remarkable offer affords a fine opportunity for you and the members of your family to learn to typewrite. It is so easy to learn. If requested, we include free "The Van Sant System of Touch Typewriting." A similar course would cost $40 at a business college.

With our easy course, you learn it in a jiffy—it takes no time at all to learn to write on an Oliver.

Was $100 Now $57

Hundreds of Uses

The Oliver Nine is especially adapted to your needs. It comes complete—nothing extra to buy. Thousands are now used by the most progressive farmers.

The uses include: writing correspondence, addressing shipping tags, keeping farm records, drawing up contracts, etc. And best of all, carbon copies may be kept for record.

The farmer who uses a typewriter is thought of with greater respect by business men. And Mrs. Farmer can use it in writing letters to the folks and to absent sons and daughters. It's great for the whole family!

Only $3 Per Month

Guaranteed Service

Simplified construction is the secret of Oliver lifetime durability. The Oliver has far fewer parts than other standard typewriters. Don't buy until you've tried an Oliver.

And when you buy an Oliver you buy all typewriter—none of your money goes to middlemen, salesmen, agents, traveling expenses, agents' uncollectible bills, etc.

Don't Wait!

Mail the coupon today for your free trial Oliver. Note in the coupon that you are not under the slighest obligation to buy.

Or, if you want to know more about the Oliver, check the coupon for our free book, "The Typewriter on The Farm" and our beautifully illustrated catalog. It tells how your dollar does double duty.

Understand all up-to-date farm machinery. Will accept position anywhere. Can furnish best of reference. State full particulars and highest wages in first letter. Address BOX 375, care Hoard's Dairyman.

Weights of Milk and Cream

Investigation by the U. S. Department of Agriculture shows that the weights of milk and cream containing various amounts of fat are approximately as follows, at a temperature of 68 degrees:

Per cent of fat	Weight of one gallon	Per cent of fat	Weight of one gallon
.025	8.63	15.0	8.47
3.0	8.60	20.0	8.43
3.5	8.59	25.0	8.39
4.0	8.58	30.0	8.35
5.0	8.58	35.0	8.31
6.0	8.57	40.0	8.28

For all practical purposes the weight of milk testing from 3 to 5 per cent butterfat may be figured at 8.6 pounds per gallon.

Kansas Creamery Short Course

As usual, this winter the Dairy Husbandry Department of the Kansas State Agricultural College at Manhattan, Kansas, will offer an eight weeks' creamery short course. This course is open to all interested in dairying, including women, and is intended to fit men for buttermakers, ice cream makers, and market milk employees. Work is also given in cheesemaking and dairy farming subjects. Men who have been in practical work for several years will find this two months' schooling a valuable chance to learn the scientific side of the manufacture of dairy products.

Work begins January 6, 1919, and closes March 1, 1919.

For additional information, address Department of Dairy Husbandry, Kansas State Agricultural College, Manhattan, Kansas.

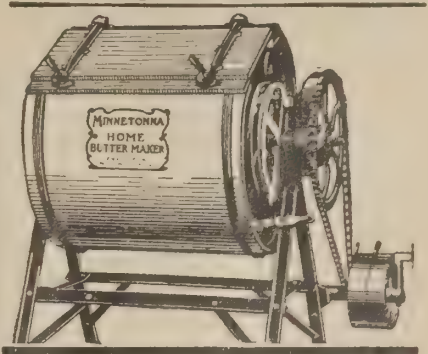
A Million Farmers Back It

o make extension work effective as been found necessary to or- ze county councils, county boards f agriculture, and farm bureaus to perate with the state colleges of culture and the United States De- ment of Agriculture in employing unty and a home demonstration t and in aiding them in carrying heir work. These county organ- ons are generally composed of ers and others in the county in- sted in agriculture. As a part of organization, there are local clubs committees who aid the agent in different communities of his coun- At present there are more than 0,000 farmers who are members of organizations assisting the county agent in his work.

In the South, special emphasis is laid upon community organizations of farmers. These are increasing rapidly and involve the work among men, women, and children. The tendency and general policy of the work in most of the southern states is gradually to form central county organizations, composed of representatives of the community organizations, to deal, in co-operation with the county agents, with such problems as are county-wide in their nature.

In the northern and western states the county organization is usually known as a farm bureau. The farm bureau is a non-partisan, non-sectarian, non-secret organization representing the whole farming population of a county, men and women alike, and acting as a clearing house for every other association interested in work with rural people. Its primary purposes are:

(1) To bring to the agent the counsel and advice of the best farmers in the county as to what ought to be done and how to do it.



(2) To provide an organization for easily and quickly reaching every community in the county with information of value to that community or to the county as a whole.

(3) To provide a plan for organized self-help, enlisting the co-operation of all farmers interested in carrying out a county agricultural program of work.

Membership is open to all residents of the county directly interested in agriculture, men and women alike. A small membership fee (usually \$1) is charged.

While the original conception of the farm bureau was an aid to county agent work, it was quickly realized that it has a broader field, and now it is coming to be recognized as the official agricultural body interested in promoting all that pertains to a better and more prosperous rural life.—U. S. Department of Agriculture.

The county that is best organized to further its own agricultural interests this year and next and in the future will command the attention of the buying public. That means profit.

Make Butter The New Way!

Butter making is now as easy as separating cream. Wonderful new Minnetonna Butter Maker puts churn to shame. Saves half to three-fourths of your time in making butter. Churns, washes, works, salts, and moistens 3 pounds to 25 pounds or more, all in same machine in less than 25 minutes.

Throw Away Your Back Breaking Money Wasting Churn!

The Minnetonna works easily by hand, motor, or engine. Gives you "over-run" adding 20% to 25% more butter from same cream. Wonderful quality creamery butter. Brings you 10c to 20c above market price per pound. Butter keeps longer. Wonderful quality buttermilk. The Minnetonna brings butter in 15 minutes, works, washes, salts and moistens in 10 minutes more.

ARE YOU FEEDING WORMS?

FEEDING wormy animals is wasting food. They eat more but they do not thrive.

Every farmer wants to be up to the limit of production now while the hungry world is calling for food.

Make every pound of feed you feed do its whole duty.

Drive out the worms and condition your stock for growth, for work—for beef, mutton and pork, by feeding Dr. Hess Stock Tonic.

Eliminate Waste and Increase Production

Condition your cows for calving by feeding Dr. Hess Stock Tonic before freshing. Then feed it regularly to increase the flow of milk. It lengthens the milking period.

It means healthy, thrifty animals free from worms. It contains *Tonics to improve the appetite, Laxatives for the bowels, Vermifuges to expel worms, Aids for digestion, Ingredients which have a favorable action on the liver and kidneys.*

The dealer in your town will sell you Dr. Hess Stock Tonic according to your needs and refund your money if it does not do what is claimed. Buy 2 lbs. for each average hog, 5 lbs. for each horse, cow or steer, to start with. Feed as directed and see how your animals thrive.

Why pay the peddler twice my price?

25-lb. pail, $2.25; 100-lb. drum, $7.50

Except in the far West, South and Canada.

Smaller packages in proportion.

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

Contagious Abortion of Cattle

(Continued from page 808)

and apparently healthy. In norma calving the membranes are quickl expelled. During pregnancy the serve as the attachment betwee mother and off spring rough whic the latter receives its nourishmen At the time of birth, however, tha attachment is broken and the youn animal begins to lead an independer existence, whereupon the membrane have no further function and becom dead tissue. Normally they are quickl ly expelled, but where there has bee disease the resulting inflammator process causes adhesions between th membranes and the uterus of th mother, which are not easily broke down. These dead tissues soon b come infected with the germs whic cause decomposition. If proper trea ment is not given, the protrudin parts rot through and drop away, an the uterus closes upon the retaine portions.

Nature attempts to remove th rotting mass, sealed up within th uterus, through absorption, and th poisonous products of decompositio and even the pus-producing germ themselves, are taken up by th blood. Blood poisoning results. The is an offensive, purulent dischar from the genital organs, the anim rapidly loses condition, and death not uncommon. If the animal h sufficient resistance to survive, the i flammation within the uterus caus a thickening of its walls and the d struction of its lining membranes, that there remains but a thick-wall sac containing a quantity of fo smelling pus. This completely d stroys the breeding function and t animal is rendered permanently ste ile. If she finally survives, she s dom regains her former condition health. These serious results c often be prevented and the breedi function preserved to the animal adequate treatment at the time abortion, but neglect has caused t ruin of many a fine cow.

Barrenness, or sterility, is anoth common accompaniment of abortio disease. It may result, as just d scribed, from structural change which render conception mechanica impossible. Furthermore, it has be discovered that the formation of cys within the ovaries operates to prevet breeding and, again, a chronic i flammation may have the same resu Experts are frequently able to remo these hindrances to breeding, b occasionally a case of barrenness s found where no structural defect c be detected and no other cause can discovered. The reproductive functi is one of life's processes so subtle i its operations that much still r mains a mystery, and causes of st ility can not always be assigned treatment prescribed.

Methods of Spread

It is necessary, before we can p ceed intelligently to control a disea to understand how the germs gain trance to the animal body, and methods by which they are carr from herd to herd. It has long b thought that the germs of abort disease were introduced directly i the organs of the female by the b at the time of service. Many ca cannot be accounted for in any ot way. More recently, however, in tigators have come to believe that fection may also enter through digestive system by means of c taminated food and water. In former case, the bull serves an fected cow; his genital organs bec contaminated, and he transmits infection mechanically to the n cow he serves. In the latter, the fected discharges from an abort cow contaminate the food, the ge

a carried into the digestive system, were they are taken up by the blood a l transported to the pregnant uter- u there to set up the disease which l er results in the death and expul- s n of the calf. In either case it is t infected cow that is the dangerous f tor. Infection is doubtless most f quently conveyed from herd to h d by the apparently normal but in- f ted female. The germs quickly die i the body of the bull and when once i ected, he does not become a con- s nt disseminator of the disease. P per treatment will render him s e again as a sire.—Circular 69, K nsas College of Agriculture.

[To be continued]

Eliminating the Middleman

HOARD'S DAIRYMAN:—To-day's pa- p says that the National Grange at S acuse recommends: "That the p sent system of marketing and dis- t ution is clumsy, wasteful, and in- e cient and should be abolished and t t unnecessary middlemen should b eliminated."

nasmuch as the difference between t farmers' 35 cents and the con- s ner's dollar is the price of distri- b tion, this is sufficient evidence of c msiness and inefficiency. And the p blem should be worked out scien- tically by expert economists.

Direct trading is no new thing in t world, but one thing has occurred t me, namely: The railroads, char- t ed for transportation and not for t imate distribution as are the ex- p ss companies or the mail service, a now under government manage- m nt and some reforms and efficien- c s have been effected. It is apparent t at the rights of way in all cities c ver large areas of real estate which i largely unused except for trackage. Why cannot this space be used for i mense produce terminals, munici- pal and other markets, cold storage plants, dehydrating facilities, etc?

A few days ago I laid aside a clipping from the North American of Philadelphia which I now send you herewith. And I would like to know how much the farmer gets for this same New York milk and just what are the facts? Incidentally, I note that the city papers do nothing to correct the prejudice against "those horrid old farmers who make our living cost so much". Even the Treasury Department's report on profiteering was edited for the papers under the headline: *"Large Profits of Dairies"* and said "The small dairymen made the largest percentages of increased profits—500% and more". What is the truth?

Le Raysville, Pa. H. G. N.

There is no question as to the need for a reformation of our system of distribution but just how it will be accomplished in a practical manner is the big question. It is mighty easy to criticize the present and prevailing methods but to get a workable substitute is what is most needed. We thought we had something along this line when the parcel post was established but experience teaches us that it has proven a mere drop in the bucket.

The larger question to be considered is as to whether the middleman's service is necessary; and if so, whether his charges are or are not exorbitant. On this subject we have had more discussion than we have had information, more noise than light. Our particular attention has been challenged by the cost of the delivery of milk. It seems inconceivable that it should cost as much to get the product to the consumer as it does to actually produce it on the farm, but it seems to us that this is not so much a question for discussion as it is a matter of proof, and thus far sufficient or adequate proof is lacking. Also, it has not been fully determined as yet as to whether the present system of distribution can be so changed as to effect the desired economies. As long as consumers demand a particular kind of service and will insist upon the liberty of choosing their particular milk distributor, they will have to pay the expenses of such delivery.

The unfortunate attitude of the average city newspaper, in so far as it concerns the producer, is due to a lack of understanding of conditions and the sorry fact that the majority of such papers are seeking to give their readers prejudicial information; or, rather, they are catering to their passions and prejudices rather than giving information. They seek to be known as the protector and friend of the consumer, whereas they may actually be his worst enemy in so far as ultimate effect is concerned.

In reply to the particular inquiry, we would say that the December price in New York will return the producer approximately 9 cents per quart for milk testing 3 per cent.

Show Way to Cheaper Pork

Pennsylvania farm bureaus, working with a number of hog raisers, have used feeding experiments conducted by the Pennsylvania State College to demonstrate that at least one-half of the grain feed bill in raising hogs can be saved by providing green feed throughout the growing season.

HEAPS OF DIFFERENCE

BUFFALO CORN GLUTEN FEED

Very Highly Digestible

A FEED

Low in Digestibility

What Do These Piles Mean?

THEY are intended to impress upon you how important a thing the digestibility of feed is. Because too many men, usually those who can least afford to pay for poor choices, are influenced in their feed buying by the size of the bag.

Every dairyman must know, surely, that his cows can make milk from only that part of their feed which they can digest, and cannot make milk from the part they cannot digest.

Why is it, then, that dairymen don't pay more attention to *the per cent digestible* of the feed than they do, and less attention to how feeds compare in apparent bulk?

Suppose you are at your feed store to buy feed. The dealer shows you two piles of two different kinds of feed, and each pile weighs a ton. But one kind is nearly all digestible and the other is not.

You can't tell much about how they compare in digestibility by looking at them. . . .

But you certainly can by feeding them. There's a heap of difference in the amount of milk you get.

You naturally would expect to get the most milk from the Buffalo Corn Gluten Feed, because it is so highly digestible, and you know all the time that it's only the digestible part of feed that makes milk.

The next time you go for feed, tell your dealer you want the best there is.

NEW YORK **CORN PRODUCTS REFINING COMPANY** CHICAGO

A Healthy Ayrshire

This champion three-year-old is a notable example of PERFECT HEALTH. Her yearly record is 15,056 lbs. of milk and 589.2 lbs. of butter fat.

Join the "HEALTHY COW" Movement

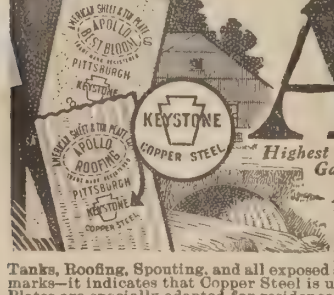
Present-day prices for dairy products are making dairymen everywhere think more about the milk production of their cows.

A cow in bad health is an expense, and the higher milk prices rise, the greater the loss. *The poor producer must go.*

The "poor milker" is usually non-productive because of some disorder of the digestive or genital organs that is sapping her health and strength. Even apparently slight troubles of this nature usually lead to more serious ailments so common among dairy cows, such as Abortion, Retained Afterbirth, Barrenness, Scouring, Bunches, etc.

What to Do with Sick Cows

A sick cow should be treated like a sick person—with medicine that will correct the trouble. Kow-Kure is the most valuable and best known remedy for the prevention or treatment of cow ailments because its medicinal properties act on the organs where disease originates.



There will be no trouble about the milk flow of a healthy cow; keep **yours** healthy by having KOW-KURE on hand always. Feed dealers and druggists sell it, in 60c, and $1.20 package.

Our great, free book, "THE HOME COW DOCTOR," is yours for the asking. It is full of valuable points for cow owners.

The Only "Drop Clean" Water Bowl Made

Manurial Values of Dairy Feeds

When feeding dairy cattle, and especially if purchasing high priced concentrates, it is well to consider the fertilizing value as well as the feeding value of feeds. Just as the value of a commercial fertilizer depends on the amount of available nitrogen, phosphoric acid, and potash it contains, so, to a large extent, does the value of manure depend upon the amounts of nitrogen, phosphoric acid, and potassium contained in the feed consumed by the animals. Those feeds which contain relatively large amounts of the three important plant foods make good manures and those which contain small amounts make poor manures.

The following tabulation shows the equivalents of nitrate of soda, 16 per cent acid phosphate, and muriate of potash contained in some of the common dairy feeds. The amounts of nitrogen, phosphoric acid, and potash contained in these feeds were taken from Henry & Morrison's "Feeds and Feeding", appendix, Table III. The nitrogen was then calculated as nitrate of soda, the phosphoric acid as 16 per cent acid phosphate, and the potassium as muriate of potash because these are the more common forms in which these constituents are found in commercial fertilizers.

One ton of corn contains the equi lent of 196 lbs. of nitrate of soda, lbs. of 16 per cent acid phosphate, a 12 lbs. of muriate of potash.

One ton of oats contains the equi lent of 240 lbs. of nitrate of soda, lbs. of 16 per cent acid phosphate, a 18 lbs. of muriate of potash.

One ton of bran contains the equi lent of 310 lbs. of nitrate of soda, lbs. of 16 per cent acid phosphate, a 52 lbs. of muriate of potash.

One ton of oil meal contains equivalent of 716 lbs. of nitrate soda, 236 lbs. of 16 per cent acid ph phate, and 40 lbs. of muriate of p ash.

One ton of cottonseed meal conta the equivalent of 774 lbs. of nitrate soda, 354 lbs. of 16 per cent acid ph phate, 56 lbs. of muriate of potash.

One ton of clover hay contains equivalent of 248 lbs. of nitrate soda, 52 lbs. of 16 per cent acid ph phate, 52 lbs. of muriate of potash

One ton of alfalfa hay contains equivalent of 288 lbs. of nitrate soda, 72 lbs. of 16 per cent acid ph phate, 70 lbs. of muriate of potash.

Figuring the Manurial Value of Fe

Calculating the manurial value these feeds at the present high pri of fertilizers (nitrate of soda 5 ce a pound, acid phosphate 1.2 cent pound, and muriate of potash cents a pound) corn would hav manurial value of $13.90 per t oats, $17.80 per ton; bran, $33.23 ton; oil meal, $48.63 per ton; cott seed meal, $56.95 per ton; clover h $26.02 per ton; and alfalfa hay, $3 per ton. Although one would not justified in buying nitrogen and p ash in commercial fertilizers at present prices, the above figures sh the comparative value of these fe as fertilizers, and should be use in determining the relative values the different feeds. As a rule, h ever, it is not necessary to add ni gen to the soil, if legumes are gr in rotation with other crops.

Manure Should Be Carefully Sa

One must remember that not all fertilizing constituents in a feed recovered in the manure. Averag the results obtained at the Ohio periment Station and those repo in Henry & Morrison's "Feeds Feeding", we find that approxima 75 per cent of the nitrogen, 80 cent of the phosphoric acid, 80 cent of the potash in the feed consu by a dairy cow are recovered in manure. In addition to the const ents which are lost in the proces digestion, much may be lost afterw Much of the waste manurial va through the loss of urine, by leach and by fermentation, may be vented by hauling the manure rectly from the stables and spread it on the fields. When this is not p ticable the manure should be kept der cover and compacted by allow the animals to run over it.—R GRADY, in Ohio Experiment Sta Monthly Bulletin.

Northern Ohio Note and Comment

HOARD'S DAIRYMAN:—Rapid char in milk transportation to the citie Northern Ohio and its distributio the consumers are fast being inau rated. Out of Cleveland, in every rection, one now finds paved road brick or concrete extending from to 100 miles, and these are work many changes in placing country duce on the market, direct from farms, by means of the auto tr Not the least have been the motor trucks, huge double decked aff carrying into the city a hundred ty-quart cans of milk from 25 to 4 more miles away. These trucks

by different milk companies that ge a rate for carriage about a h less than the railway com- es and deliver the milk to the s in the city without charge for age. Along their country routes, sees the small milk platform at arms, while at the principal four rs the dairymen meet the trucks, ng from farms more or less te, exchange their full cans for y ones, and then the truck moves the next loading point, and final- aches the city about 10 a. m. of the large city dealers, with neries in the country, load the s at their own plants and take nmense loads. Such a truck is ng as I am writing this, carry- 25 forty-quart cans.

me trucks gather in part for city concern, and the balance to the small retailers who take share from the truck. Yet an- innovation is that of the dairy- who takes his Ford truck to de- the milk of his dairy, and pos- that of a neighbor, to grocers in city who are retailing "fresh " to their customers direct. This is rapidly extending as these retail at two and three cents a t below the regular prices. A is fast springing up, men with trucks scouring the country for poultry, fruits, vegetables, and ike, that is proving of great bene- the farmers. They are receiving to city prices for their produce, ut the cost of shipping and the rtainty of returns from the con- nent.

e unsatisfactory plan of making prices in the past, the old meth- f milk distribution, and the ad- of the milk truck have led to the ation of a very large milk con- in the city, now known as the r Meadow Creamery Company. company consists of something 100 retail grocers of the city, taking $1,000 worth of stock. A central plant was erected in the t and furnished throughout with most modern dairy apparatus, ng about $50,000. Here all milk ought to be pasteurized, bottled, then distributed among the gro- and small dealers who are now coming to buy of the new com- instead of buying in the coun- as before. The company does no ling, but hotels and restaurants now large patrons.

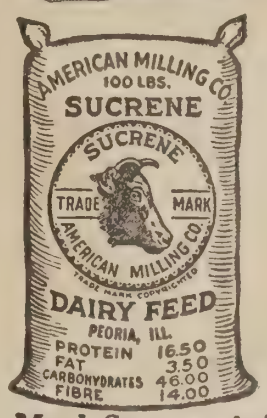
his new company started out in odest way, first knowing where could get a country supply and y demand. They send their trucks the country some 25 miles or so g different routes and five hun- -can trucks are now employed. is also shipped in by train. On mber 1, the company was getting thing like 750 cans a day. The e now paid the farmers is the one by the United States agents and n the embargo is lifted the com- will deal with the price com- ee of the Northern Ohio Protec- League.

he new company asks for little it. They pay every 15 days so e is never but 15 days' milk unpaid not 45 days as by the older cus- Neither does the new company pt accounts. Milk is spot cash y day on delivery; they do not to use so much capital. The com- y says that it is going to sell a so good, and at a living price for that there will be no occasion to r their stock or make tardy pay- ts to farmers. There seems to be eeling of confidence among the ners, and milk along their routes is g offered faster than the company now find place for. Its trade is dly extending, and will soon reach ll 1,000 cans per day, and all this showing at the close of the first month.

There seems to be a turn of the tide in selling train loads of cows in this section for export to somewhere in the United States and the farmers themselves now seem to be buying up all offerings, notably since prices of milk at the farms gradually went up from 28 to 35½ cents, where it is to stay for four months. There does not seem to be any great let-up to the auction sale of cows or any falling in price. The registered cow brings little more than a fine grade cow that promises as good milk yield. These grades are bringing from $125 to $175.

Ohio. JOHN GOULD.

"I've noticed", said the successful old farmer, "we're apt to value most those things which come to us because we go after 'em. And those who haven't the energy and force and fight to go after things, work overtime trying to convince the rest of the world that they have been cruelly left on the back door-step of Time."



What We Dairymen Know About SUCRENE DAIRY FEED

Results Prove Quality

During the 18 years Sucrene Dairy Feed has been on the market its milk producing ability has been proved to the satisfaction of thousands of dairymen. Leaders in the dairying business have adopted it only after thorough tests made in their own way, as compared with other feeds. Their uniform experience is that:

Sucrene fed cows give more milk at less feed cost;
Sucrene fed cows produce fine flavored butter;
Sucrene fed cows are less liable to calving troubles;
Sucrene fed cows on pasture give more milk than cows on pasture alone and are better producers all year;
All cows enjoy Sucrene Dairy Feed because of its variety, palatability and easy digestibility.

Much Stronger in Digestible Protein Than Any Grain or Ordinary Ration Sucrene Dairy Feed takes the place of all other concentrates. The guaranteed analysis of 16½% Protein, 3½% Fat, 46% Carbohydrates and 14% Fibre constitutes a scientifically balanced milk producing ration. It brings a substantial increase of milk flow, above the ordinary ration, when fed only with the usual roughage, because it supplies the cow, every day, with the proper milk producing nutrients in correct proportions.

High feeding quality in Sucrene Dairy Feed is secured by a proper combination of the following materials: Cottonseed Meal, Germ Oil Meal, Cocoanut Meal, Corn Distillers' Dried Grains, Ground and Bolted Grain Screenings, Clipped Oat By-Product (for necessary bulk), Pure Cane Molasses, Calcium Carbonate and Salt.

We would like to give you the experiences of other dairymen with Sucrene Dairy Feed. Carefully prepared illustrated literature sent free on request. Fill out and mail us coupon or write us a postal.

When Writing to Advertisers, Mention Hoard's Dairyman

for Calf Scours

Save every Calf. High meat and milk prices make control of Calf Scours doubly necessary.

Scouring calves indicate a germ infection that is likely to run through your entire herd with serious losses. The loss of one calf is bad enough, but nothing compared to your loss when the infection spreads, as it will unless checked. Then your year's work in building up your herd is wasted and your profits lost.

Our method of handling calves will promptly stop scours and finally banish it from the premises. One good calf saved will repay the expense of protecting your stock for a long time against the disease.

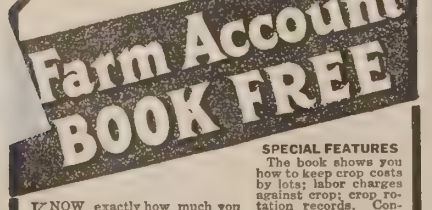
B-K, the powerful germicide and disinfectant, is especially adapted to this work. B-K contains no poison, acid nor oil. When used internally it destroys germs, heals inflamed membranes, relieves irritation, restores healthy action. B-K may be given freely in the milk and drinking water.

The B-K plan is simple and practical. It is giving wonderful results. A well known breeder of registered stock says:

"We found vaccines of no value in stopping calf scours, but the prompt, efficient treatment with B-K checked the trouble quickly and saved us the loss of many valuable calves."

B-K is sold by Dairy and Farm Supply Dealers, General Stores, Druggists, etc. If your dealer does not have it, send us his name.

There are over "145 Farm Uses" for B-K



FREE BULLETINS: Send for our valuable bulletin No. 136, "Calf Scours," also information on other farm uses and our "Trial Offer."

Brooks Appliance Co., 467 State St., Marshall, Mich.

Shrink in Milk

I have a choice grade Guernsey cow that dropped her calf Aug. 17 and cleaned O. K. She gave about 16 quarts of milk per day up to September 20 when she gradually dropped off until now she gives about 4 quarts per day and has developed the hardest milker we have. Formerly she was a good, free, easy milker. I bred her October 10. Can I do anything to bring her back to her milk?

Wakefield, Mich. W. J. W.

The fact that the cow has become a hard milker would indicate that structures or growths have formed in the ducts of the teats or that the udder has become somewhat affected by mammitis. Sterilized dilators should be used to increase the calibre of the milk ducts or growths should be removed. Have a veterinarian make an examination and he may decide to operate with a teat bistoury, if dilators (teat plugs) do not suffice. Meanwhile massage the udder well at milking time, which should be three times daily in such a case.

Abortion

Last winter one of my cows lost her calf when about 3½ months along; another when about 7 months along. And now lately one lost her calf 5 months along. Please tell me what is the trouble.

Tony, Wis. E. L. K.

The cows no doubt are affected with the contagious abortion disease, regarding which a bulletin recently has been published by the agricultural experiment station at Madison, Wis. Apply to the station for a copy and follow its instructions as to treatment. Meanwhile, isolate the cows, have them disinfected by a veterinarian and also cleanse, disinfect, and whitewash the stable under his direction.

Some farmers never think of painting their farm machinery. They should remember that paint is not only a beautifier, but a preserver.

Retained Afterbirth

When the membranes remain in the uterus of a cow and decompose, inflammation of the lining of the womb may be caused, and this, with the absorption into the blood of the products of putrefaction, leads to ill-health, emaciation, diminished milk supply failure to breed, and often blood poisoning and death.

Hood Farm Breeding Powder

causes the afterbirth to come away naturally in a few days, and thoroughly cleanses and disinfects the parts, leaving the cow in normal condition for breeding.

"After four years of experience I find Hood Farm Breeding Powder very necessary, for keeping my herd from aborting. It cleans the cows out quickly and clean, they breed early and are sure to stand."

Stuart Bird, Cropper, Ky.

Try Hood Farm Breeding Powder once and you will never again forcibly remove the afterbirth.

Prices prepaid $1.15, $2.75 and $5.00. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75. Mention this paper.

C. I. HOOD CO., Lowell, Mass.

"What Will the Baby be Like?"

A question every expectant mother asks a dozen times a day. Does she know that the answer largely depends on her own health, and that her own intestinal system, which is especially liable to constipation, must be kept clean or it will encourage the breeding of serious disease? There is sound medical advice to every prospective mother in a booklet called

"The Days That Go Before"

which will be sent on request, free, to any address. Write today — it may save your baby's future.

RALPH TRATT, WHITEWATER, WIS.

JERSEYS

How much are a cow's teats worth?

This depends on how much it costs to fill the udder and how rich the yield in butter fat. Jerseys are famous for the richest let-down at the lowest possible up-keep. Jerseys are known as "the profit breed" because they are natural money makers. Beautiful and hardy, their perfection has been standardized for over two hundred years.

Ask breeders for pedigrees and prices. Let us send you some very unusual information about this record-breaking breed.

OFFER FOR SALE

King Sadie Vale Urma 235352

Born March 30, 1918

Here are the records of his nearest dams:

DAM (two-year-old)	*20.04 lbs.*
ONE GRANDAM	*38.46 lbs.*
THE OTHER GRANDAM	*25.50 lbs.*
ONE GREAT GRANDAM	*41.06 lbs.*
ANOTHER GREAT GRANDAM	*41.06 lbs.*
The five average	*33.22 lbs.*
His 7 nearest Dams average	*31.27 lbs.*

Like his sire, he is dark in color, long, straight and deep-bodied.

The sire, King of the Sadie Vales, is out of a 38.46-lb. cow. His dam's dam is also his sire's dam, namely: Sadie Vale Concordia 4th (41.06 lbs. butter). His dam and grandam have the highest 30-day averages in the World, 157.71 lbs. butter. No other bull in the World can equal his three to nine nearest dams for 30-day butter production. The sire of King of the Sadie Vales is the only bull in the World with a 40-lb. dam, a 40-lb. sister and a 40-lb. daughter.

The dam of King Sadie Vale Urma recently made as a two-year-old: 20.04 lbs. butter, 399.20 lbs. milk (7 days); 73.26 lbs. butter, 1,571.30 lbs. milk (30 days). Her dam has a 25.50-lb. record, and her maternal grandam has a 26.38-lb. record. She is a granddaughter of Sir Urmagel Burke (three 30-lb. daughters), and a great granddaughter of Pontiac Korndyke (two 40-lb. daughters).

We have put the price on this bull that will put him well within reach of the small breeder. For further particulars, write, wire or come to

A Rare Chance

To secure a few choice

Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.
River Meadow Farms, Portlandville, N. Y.

Holstein Heifers

325 High grade heifers 1½ to 2½ years old, bred to freshen this fall and early winter, large, well marked, fine condition.

50 Registered yearling heifers, beautifully marked, very well bred, good size, nice condition, extra fine lot.

35 Registered heifers, bred to freshen early this fall, practically all springing now, fine individuals, bred to good bulls.

Positively the best lot of registered and high grade heifers ever offered for sale in New York State. Buy now before the price advances.
J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Springdale Farms Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. We are prepared to furnish carload lots of fresh cows, springers or cows due to freshen this fall, also two and three-year-old heifers. If you want large, heavy producing cows it will pay you to see our stock. You will find our prices right. F. P. SAUNDERS & SON,
Cortland, New York. Office 50 Clinton Ave.
Telephone 116 or 1476M.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.
Susquehanna Farms, Hartwick Seminary, N. Y.

A Grandson of the Famous $50,000 Bull

Here is a show bull, about three-quarters white, born Sept. 27, 1918. His sire is one of the best bred sons of the World's Greatest Sire,

KING SEGIS PONTIAC ALCARTRA

His dam has a junior three-year-old record of 22 lbs. butter and 482 lbs. milk. His ten nearest tested dams average 28 lbs. butter. Price $135. G. G. BURLINGAME, Cazenovia, N. Y.

Only 3 Bulls Left For Sale

They are sons of Sir Johanna Piebe White whose dam and full sister average 1030 lbs. butter for 1 year and his 1st 3 daughters to freshen, as Jr. 2-year-olds, made 19, 20, and 23 lbs. butter 7 days. These are Dec. and Feb. calves and their dams are good yearly record daughters of count of the Pontiacs. Herd on Fed. Accredited List.
RAY MEEKER, MUNCIE, INDIANA.
P. S. Meet me at the National Dairymen Sale.

Service Bulls

5 bulls from 1 to 2 years old. One a son of Pontiac Korndyke. One a son of King Segis Pontiac. The others and several not of service age are grandsons of these two great sires. Also a fine daughter of King of the Pontiacs and one by Pontiac Korndyke. Priced to sell. Write for full information.
WM. N. OSBORNE, WANATAH, IND.

FOR SALE—A YEARLING BULL

of 5% breeding, whose dam's 3-yr.-old record with two of her three nearest dams and his sire's three nearest dams, average 29.62 lbs. butter in 7 days. His sire from a daughter of Hengerveld De Kol, and sired by a son of K.P. Pontiac Lass. His dam by a 27-lb. son of Colantha Johanna Lad. Also, bull calves sired by a son of King Segis Pontiac, and whose dam is a daughter of Pontiac Korndyke. Priced for quick sale. For further information write, GLENN WILSON, Wanatah, Ind.

Holstein Breeders, Attention! Buy your bull calves young, 2 to 6 mos. old, good individuals, nicely marked from A. R. O. dams. Sire: King Segis De Kol Fayne 8th, whose dam has 7-day A. R. O. butter record of 25.63 lbs. His grandsire is the sire of Segis Fayne Johanna, the world's record butter cow for 7 days. 1 service bull for sale. C. I. Reamer, North Liberty, Indiana.

HIGH GRADE HOLSTEIN

Calves, either sex, from heavy producers, well marked, 4 to 6 weeks olds, 15-16ths pure. $25 each, crated and shipped to your station. Express and all charges paid here.
Highland View Place, - Whitewater, Wis.

A SON OF KING OF THE PONTIACS

The World's Greatest Proven Sire

For $350

This is half his value—but his color is against him, as he is nearly all black. He was born in August, is a splendid individual, and is out of a 19-lb. 3-yr.-old. Don't miss this chance of a life time.

Geoffrey G. Burlingame, Cazenovia, N. Y.

$300.00

Buys a Son of the Great Sir Veeman Hengerveld

Bull calf born Oct. 20, 1918, a large growthy fellow, and a fine individual.

Sire:—Sir Veeman Hengerveld, the latest century sire, and the only living sire with sixteen 30-lb. daughters. His daughters average the highest for butter and third highest for milk of any sire having 60 or more A. R. O. daughters.

Dam—Blanche DeKol Segis, a granddaughter of King Segis, and has the following A. R. O. record: Butter, 7 days, 28.48; 30 days, 109.86. Milk, 7 days, 617.9; 30 days, 2,604.

This young bull is offered at less than half his value, on account of his being dark in color.
W. D. ROBENS, POLAND, NEW YORK.

Owing to Long Continued Illness—

I have decided to sell immediately part or all of the Lakeside Herd, including heifer calves, yearling heifers, bred heifers, cows and bulls of various ages, several of them from dams with records of 30 to 35 lbs. butter in a week. A rare chance for parties who wish to breed a high class, embracing individuality, breeding and production. E. A. POWELL,
904 W. Genesee St., Syracuse, New York.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.
Henry Stevens and Son, - Lacona, N. Y.

THOS. STEWART, BIGGSVILLE, ILLINOIS.

Uneeda King Alcartra Pontiac

Born January 3rd, 1918

A Real Winner For Some Small Breeder or Beginner...

IT WOULD BE HARD to find a better individual than this young bull. He is marked about three-fourths black.

HIS DAM HAS MADE 21 lbs. butter in 7 days as a two-year-old. In 30 days she produced 78.86 lbs. butter from 1,755.2 lbs. milk.

SHE IS FROM Marion Korndyke DeKol, a cow with a record of 28.23 lbs. in 7 days from 648.60 lbs. milk. As a junior four-year-old she made 27.86 lbs. butter from 565.90 lbs. milk.

THE DAM'S SIRE is Korndyke Pontiac Aaggie, a son of Aaggie Alban Shadeland, 30.52 lbs. in 7 days from 616 lbs. milk.

HE IS SIRED BY Korndyke Pontiac Pet, a son of Pontiac Korndyke, who has 147 A. R. O. daughters, two of them above 40 lbs. and 19 above 30 lbs.

THE SIRE OF Korndyke Pontiac Pet is Pontiac Pet, 37.68 lbs., a former world's champion and daughter of Pontiac Korndyke.

NOW, COMING BACK to the sire of Uneeda King Alcartra Pontiac is the famous young sire, Uneeda King Alcartra, a full brother to King Joh.

HE IS FROM Uneeda Korndyke Abigail, the 33-lb. daughter of Johanna McKinley Segis, the only 40-lb. son of the famous King Segis. His dam is Johanna DeKol Van Beers, 40.07 lbs. in 7 days.

UNEEDA KING ALCARTRA is sired by the $50,000 bull, King Segis Pontiac Alcartra. He is from a world's record daughter of King of the Pontiacs and sired by King Segis Pontiac.

SON OF KING SEGIS and the world's champion producer, Pontiac Clothilde DeKol 2d, 37 lbs. in 7 days and 1,271 lbs. in a year.

TRACING, AS HE DOES, four times to Pontiac Korndyke, through two 37-lb. daughters, through King of the Pontiacs, his greatest son, and Korndyke Pontiac Pet, a 37-lb. son, Uneeda King Alcartra Pontiac has every reason to be a great sire.

$600 BUYS HIM DELIVERED to any point in the U. S. If he does not suit you as an individual, send him back at our expense.

FEDERAL TUBERCULIN TESTED and guaranteed sound in every way.

The E. C. Schroeder Farms, Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

If You Want Milky Bulls

CREATOR

Pabst's New Herd Bull

Sire: Sir Pietertje Ormsby Mercedes, the greatest sire of Association and Show Ring prize winners of the breed. He has three daughters with yearly records from 1,140 lbs. to 1,389.45 lbs. butter and eight with 7-day records from 30.66 lbs. to 42.31 lbs. butter.

Dam: Spring Brook Bess Burke 2d, the greatest living cow of the breed in many respects. She possesses a combination of size, individuality, short, and long distance records that cannot be equalled by any cow, past or present. She is a superb individual, weighs 2,225 lbs., has three 7-day records above 35 lbs., and three yearly records above 1,000 lbs. butter.

PABST STOCK FARM
Dept. A, Oconomowoc, Wis.

Yearly Record Bull Calf

Born August 8th, 1918

Sire—Iowana Sir Ollie, 2 A. R. O. daughters including state record jr. 2-yr.-old for 7 and 30 days. He is a son of the famous 31-lb. cow, Ollie Watson Prima Donna, and sired by a son of Jessie Fobes Bessie Homestead, 34.96 in 7 days and 932.73 in a year.

Dam—Groveland Inka Netherland. Butter, 1 yr., 832.75; milk, 19,640.4 lbs. Butter, 7 days, 24.87; milk, 556.20. Her sire is the old time show bull, Groveland Inka Hijlaard, and her dam a granddaughter of DeKol 2d's Butter Boy 3d. Calf is ¾ white and an outstanding individual. Write now for price, pedigree and photo.

WALCOWIS FARMS,
Lake Geneva, Wis. N. Dickinson & Son.

How About a Herd Sire?

MUTUAL FOBES LONGFIELD DEKOL 82959
A Splendid Son of His For Sale.

The Calf—M. M. Tritomia Fobes Longfield was born Feb. 2, 1918. He is nearly white, as straight as a line, and very well grown.

His Sire—Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters and a large number of younger ones coming on that will be retained in our herd. His sire is one of the good sons of Mooie Mutual DeKol and his dam, a daughter of Homestead Jr. DeKol, made 30.04 lbs. butter, 630.80 lbs. milk in 7 days as a jr. 3-yr.-old; 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days. (World's record when made).

The Dam, Milford Tritomia Fobes Homestead, a daughter of Canary Fobes Bessie Homestead, made 17.35 lbs. butter, 358.2 lbs. milk as a jr. 3-yr.-old; the second dam 17.38 lbs. butter, 408.3 lbs. milk; third dam 22.19 lbs. butter, 488.40 lbs. milk.

This is an excellent combination of breeding, the sire of this youngster and his dam's sire both being from daughters of Homestead Jr. DeKol, both with records above 30 lbs. butter and 600 lbs. milk.

The calf is priced within reach of any small breeder. Write us today for complete information about him.

MILFORD MEADOW'S STOCK FARM, Lake Mills, Wis.

Rock River Valley Farm

Awarded

FIRST PRIZE

In Wisconsin Dairy Cow Competition

The *Winner, Queen Juliana Dirkje*, produced in one year as a 3-year-old 1,021.72 lbs. butter, (80% fat.) Over 30 yearly record cows in herd headed by Mutual Piebe DeKol.

A few young bull calves from these cows sired by this bull for sale. (Herd tuberculin tested.)
JOHN HETTS, FORT ATKINSON, WIS.

FOR SALE—REGISTERED HOLSTEIN BULL
We still have one dark colored bull about eleven months old, well grown and a splendid individual, show ring type. His two nearest dams average 25 lbs. of butter for seven days, and 700 lbs. for the year, one of them as a two-yr.-old who gave 16,000, lbs. of milk in a year. They will be tested again at their next freshening and we feel very sure that both dams will make at least 30 lbs. He is sired by a grandson of the great King of the Black And Whites. Will make a great bull for somebody. Price $250.00—decidedly reasonable quality, breeding and records considered. Address:
Elm Leaf Stock Farm, Bear Creek, Wisconsin.
James McKone, Proprietor, William Lucia, Mgr.

Cloverlawn Johanna Piebe

His five nearest dams average 1,070 lbs. of butter, 23,809 lbs. of milk a year. Highest yearly record bull of the world 2 years old or over. Choice young bulls from our large yearly record cows for sale. 125 head. 29 yearly record cows. State exactly what you want.
JOHN PULS, - HARTFORD, WISCONSIN

A Bull That Will Suit You

He's sired by Dutchland Colantha Belle Boy whose dam is a 27.5-lb. 3-year-old daughter of Hengerveld De Kol, and whose sire is the great Colantha Johanna Lad. His dam is Johanna Theresa 2d, a granddaughter of Sir Johanna De Kol. She made 21.68 lbs. butter in 7 days, and 782 lbs. butter, 18,600 lbs. milk in 1 year. Moreover she's a show cow,—took first as a 4-year-old at the 1911 National Dairy Show. This youngster, just a little over 6 months old, is backed by short and long time records. Individually he's a dandy, nearly half white, just the kind you've been looking for. Other young bulls by the same sire and from A. R. O. dams for sale. Write
WAYSIDE STOCK FARMS, A. L. Williams, Est., C. A. Williams, Exec. Fond du Lac, Wisconsin.

WEST SALEM STOCK FARM We offer Registered Holsteins and Poland Chinas for sale; 30 choice milk cows, three to eight years old, in calf to our Junior herd sire, Sir Aaltje Pontiac Hengerveld, a 33.68-lb. bull, and one of the best individuals in the state. He was Jr. Champion at our Interstate fair. 25 heifers and 12 bulls, three to eighteen months. These are sired by King Segis Pontiac Polkadot 8th. Well grown and nicely marked. This stock is priced to sell in single or car lots. Also offer breeding stock, Wisconsin's greatest herd of Big Type Poland Chinas. Come and see our stock, or write us for just what you want in Holsteins or Polands. We can please you. Farm located right in City Limits.
J. D. McDONALD, WEST SALEM, WISCONSIN.

LSTEINS Registered and Grade Holsteins of all ages and both sexes for sale. Can furnish several car-loads of excellent females due to freshen this fall, for immediate shipment. Several bulls ready for service.

ERNSEYS We have an excellent lot of grade and pure-bred Guernsey females. Can supply a carload of cows and heifers due to freshen before winter. All in calf to good sires.

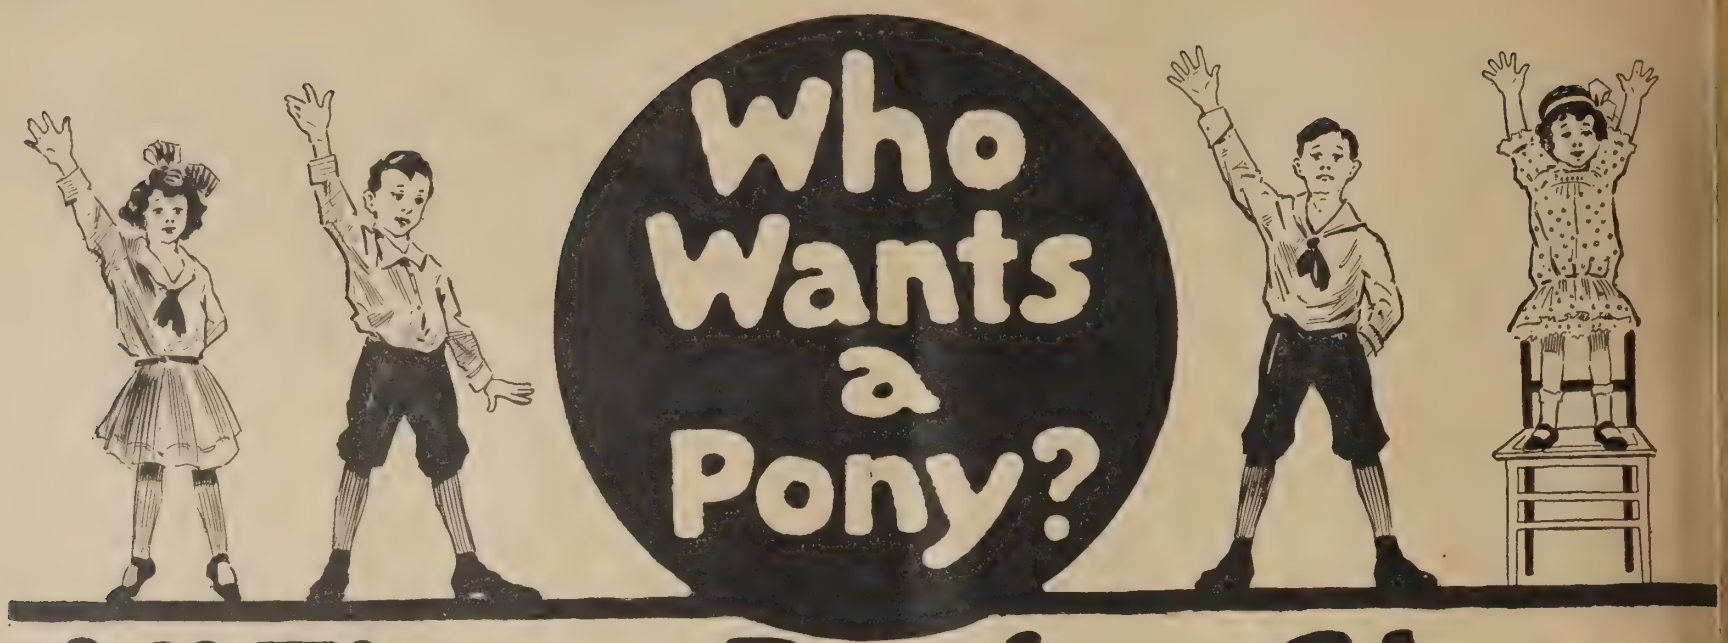
OC JERSEYS Anything you want in Duroc Jersey Swine.
tle sold on a 60-day retest guarantee. Write us at once before the best ones go.



GEWATER STOCK FARM, Fort Atkinson, Wis.

A. R. O. Holstein

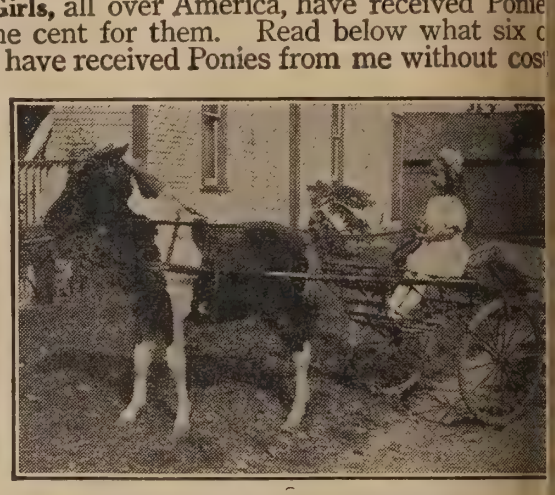
In order to make room in our barns we must sell a number of cows and heifers that are backed by large official milk and butter records. They are bred to
WISCONSIN STAR STOCK FARMS,

Cows and Heifers

our great herd sire, King Korndyke Veeman, whose two nearest dams average over 37 lbs. butter in 7 days. Write for particulars or come to
ED. M. SCHULTZ, Hartford, Wis.

All These Ponies Given to Boys and Girls

More than 500 Boys and Girls, all over America, have received Ponie from me without paying one cent for them. Read below what six o the Boys and Girls say, who have received Ponies from me without cos

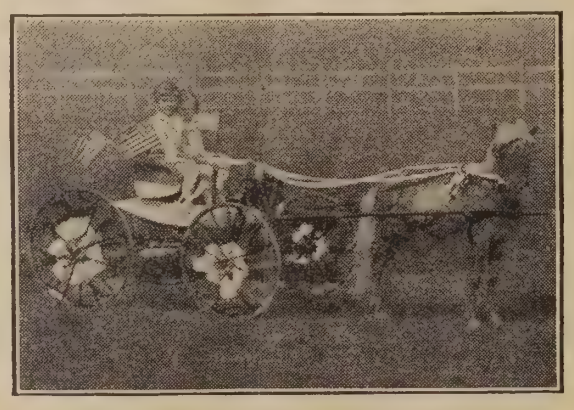


"Dolly" Given to George

George Edwin Adams lives in Cayuga County, New York. He sent in his name and I gave him "Dolly." George says: "Dolly" is a very fast little horse and he has been offered $150 for her.

"Snap" Given to Jennie

Can you guess which girl is Jennie Nadeau? Jennie should be the happiest-looking, because she sent in her name and I sent her "Snap." By the way, "Snap" is very fond of a bath, being unlike many people. Jennie and "Snap" live in Ionia County, Michigan.



"Kip" Given to Anna Ruth

Anna Ruth Miller lives in Logan County, Ohio, and she is one the little girls that received one of the 500 Ponies I have giv away. She is very fond of "Kip" and says he is a great pla fellow. "Kip" eats watermelon, cakes, crackers, candy and fru

"Marmalade" Given to Crystal

Crystal A. Andreas lives way out in San Bernadino County, California. She sent in her name and I gave her "Marmalade." Crystal says she can't tell all the good times she has with her little pet.

"Dapple" Given to Ernest

Ernest L. Heckert of York, County, Pennsylvania, saw my advertisement and sent in his name. This is the pony "Dapple," and the buggy and harness that I gave him. Ernest is driving here in the Memorial Day parade.

"Snip" Given to Harold

"Snip" is really one of the best looking ponies I ever gave aw although all of my ponies are prize winners. I sent "Snip" Harold Wilcox of Greene County, Iowa. "Snip" certainly has appetite; Harold writes me he eats candy, peanuts, cracke cookies, bread and butter, cake and ice cream.

Send Your Name for Free Pony Pictures

Now I am going to give away five more Ponies, and I want every Boy or Girl who sees this paper to stand the same chance. **If you are a Boy or Girl** send me your name right away. If you are the Father or Mother of a Boy or Girl, send in your Child's name. I will enter the name in my big Free-for-all Pony Club that starts right away, and write you all about how to win one. Don't let anyone tell you that you cannot win a Pony—our plan of giving Ponies is different from all others.

We make it easy for Children to get Ponies. We use them to advertise our big magazine, The Farmer's Wife. We have already given Ponies to more than 500 Boys and Girls, all over the country. Some of these children who received free Ponies were only 6 or 7 years old, so you know we must have made it easy for them to win. Just send your name and address and see. **No matter where you live,** no matter how young, every child will stand the same good chance to get a Pony with Buggy, Harness, Saddle and Bridle. Be sure to send in your name right now.

THE PONY KING, 321 Webb Bldg., St. Paul, Minn.

I want to send a Colored Pony Picture Circular Free to eve Boy and Girl that sends in his or her name. It gives the names and sho the pictures of the Ponies I am giving away. It also tells how to w one. Just write your name and address below and send it to me.

Just Send Your Name

THE PONY KING, 321 Webb Bldg., St. Paul, Minn.

Please send me the **Free Pony Pictures** and enter my name in your **Pony Club** so I will have a chance. I want one of the Ponies you are giving away.

My name is.....

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LVI | FORT ATKINSON, WIS., JANUARY 10, 1919. | Number 25

War Days on the Farm

HELEN S. K. WILLCOX, NEW YORK

H spring of 1917 was ushered in th an army of posters, adver- ents, and literature which blared t with much noise and thunder t "food will win the war", that farmer is in the first line n", that "an army travels on its l", in short—that the American r was expected, nay, command- gird up his loins, forget past emporary difficulties, and to "go as he never did before to literal- ed a whole new l.

I is ancient history how our farmers ntly met this new k on their re- es and responded st to a man with rd or a half more t crops. But, in pring of 1918, we not met with the en appeals and ng pictures of the previous. War become a matter ourse instead of tion and it was ly understood that body would shoul- his extra burden carry on without special urging. reasoning or con- on proved perfect- rrect, and, while on account of cription was not be had on many s for love or mon- nevertheless more larger crops were how planted, tend- and harvested this and now at the end of the present season, we find elves with breathing space and opportunity once again to look across the busy year and to take of our relatively big successes and l failures.

has indeed been a year of vement for the American farm- lso it has undeniably been a year exceptional toil, inconvenience, y disappointments—yet achieve- .

our own case, which might do as verage, we have encountered all e above mentioned difficulties and aps some additional ones—yet we very sure that it pays to work, as it "pays to advertise". Ours pure-bred Holstein dairy farm of ead and we are not yet out of debt his dairy. Hence for us there was an added incentive in doing just as much in the extra crop line as was possible—as well as being able to possess that sense of well-being which comes from a war duty conscientiously performed.

Our farm consists of 163 acres, 20 acres of which is wood-lot. It is a river farm and perfectly level and easy to work. We keep one man the year round when he can be hired within reason and last March my husband was decidedly fortunate in securing as helper an excellent young married fellow for $45 monthly and "findings". So we all got ready for business March first with a will. Our former man had left us in the lurch during haying the previous year—attracted to town by "war" wages. Hence my husband had been left alone during the 1917 harvesting and no fall plowing had been done. So we were handicapped for the 1918 season by having to literally plow up half the farm before planting could take place. This was done just as soon as the ground thawed out, but as one will recall—last winter was "some" winter and thawing took place far later than usual. But our new hired man was in truth a whirlwind worker—so he and my husband recognized no difficulties and forged ahead. The plowing and fitting was done as rapidly as possible and when the smoke had cleared away, our men had 14 acres of silo corn, 15 acres of oats, 1½ acres of potatoes, ¾ acre of beets and mangels, an acre of cabbage, and the remainder in clover, alfalfa, timothy, and pasture.

A real farmer can understand readily that even two young, strong, ambitious men would have to keep moving betimes in order to keep up with the hoeing, cultivating, spraying business of modern farming in war times. Our men did all this and more. They did our haying alone with the aid of a loader and although I longed to rake and ted because they were so rushed, the horse which was used on these implements was not a "woman's" horse—consequently I sat with hands folded (mentally) while neighboring women handled rakes and the like man-fashion. But my hands didn't remain long folded—you can be assured. During the fore-part of the harvesting of our 75 tons of hay, the beets needed weeding and I volunteered. If you have ever done this pleasant little chore, your back and little used muscles will remember it as long as they function. Oh—the aches—the stiffness—the reaction of that three weeks of back-breaking work on a woman who has never worked out of doors much can never be forgotten. But no one could be any more satisfied in her heart than I was when the work was finished and the men had not been called to assist.

AYRSHIRE CATTLE OWNED BY JOHN SHERWIN, OHIO

Along the first of August came potato digging time. Haying wasn't finished, although the two men worked until 9 o'clock each good evening—under the new daylight saving plan. So I, inspired and strengthened by contact with Mother Earth, as was the giant of old, started in to dig our spuds. At the end of the season I had mined nearly 200 bushels and picked them up—while the men at odd hours dug the remainder. I am sure those college-girl farmerettes had nothing on me! So the summer passed—the men on our farm working as they never worked before to keep ahead of the crops. The cabbages this year were exceptionally wormy and needed a lot of spraying. The potatoes threatened to blight and had to be sprayed weekly with expensive Pyrox. The clover and alfalfa were each cut twice—all taking time.

My husband owns an ensilage cutter and, with another man, who has an engine, goes to five different farms in the community "filling silo". These men in turn send their teams to each place and so the siloing is done community style. This took a solid month to accomplish this year. Then the threshing. We had 48 bushels of oats to the acre, which was nothing to brag of. Many had dried up and shaken off. We cut the immense strawstack into the big barn for bedding—running it through the ensilage machine. Lastly the cabbage was gathered—small, firm heads they were—and taken to the car at $12 a ton, a disappointing price. The beets have finally been pulled and stored—I helped pull, cut off their tops with a sharp jack-knife. Of these we have nearly 400 bushels and the pure-breds ought to make some fancy 40-pound records when we feed them! It is certain that beets "can't be beat" for milk, but they are too costly to feed as a general rule unless testing is involved.

For our year of all-round hard and strenuous labor, we have to show—75 tons of nice hay, 15 tons of which has been pressed and sold at $25 a ton. Our cabbage—9½ tons, brought in $113.

The refuse has eked out the pasture

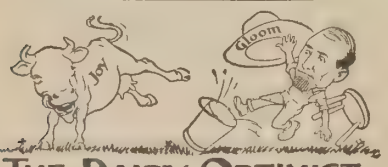
Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.



All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The Humanized Cow

Long before milking machines ever came in and cows were connected up like parts of a bath tub, I used to love to do the job by hand. There was real sentiment in milking, provided you knew how and were an experienced milker. We didn't have cream separators, and keeping dairy books was unknown. You trusted to luck. At the end of each season, if the sheriff didn't take the farm, you knew that you had made both ends meet and that selling milk didn't cost more than you got for it. Folks had a strange idea that a cow was a cow. If she had four legs and strength enough to walk to her fodder, there was no reason why she should not be as productive as any other cow.

Pedigree and breeding did not disturb us much. If we had only stopped to think a little, we would have immediately recognized the stupidity of such arguing. By the same deductions, one man could make as great success as another. Blood wouldn't tell.

But I am thinking of a Holstein I had. She wasn't all pure Holstein. Parts of her were a mystery. There were times when I was willing to believe that her ancestry dated back to the mule age. She could kick beautifully. Her great, great grandmother might have been an ostrich.

"Betty" was half human. I maintain that, too. The cow possessed the faculty of reasoning. She could think calmly and with profound analysis. I would go out to the field myself and lean over the fence and call to her. She knew I was there—I did it every evening at exactly the same hour—but do you think she'd come? Not a bit of it. She would stand and glance at me casually, and flick off a fly or two. I know she was saying to herself: "I hear him but I'll have some fun with the old gentleman. I'll just stand here and pretend I don't understand. As a matter of fact, I want to get to the barn and be milked but it's worth a minute or so to tease him."

It was always necessary for me to go out after her. When I was within a yard or so, she would quietly turn and start for home. And if cows smile, she always smiled.

It was in her stall that her human qualities found expression. She was a creature of strange and whimsical moods. Betty would not notice the flies until I was all settled and ready to milk. Then she would begin to slap at them and kick. She invariably picked out flies that were on my side. She finally became so adept that she could snap me under my left ear with her tail, nine times in every ten.

Yes, I am satisfied in my own mind that Betty really used her mind in a human way. Her eyes indicated that she did. Betty had big, fine, clear, intelligent eyes. There were shades of genuine sentiment in them, too.

I am thinking of the times the youngster would come out to the barn with a handful of salt or some lump sugar. Betty would lower her fine head and rub it against the little fellow, oh so tenderly. Cows love children.

Betty's sense of humor was highly developed. One evening my stool snapped under me and I rolled over on the floor. The bucket of warm milk went with me. I felt as if the world had started revolving rapidly and that the milky way was spilling a white stream.

That Holstein turned with great deliberation and grinned. I say "grin" advisedly. The cow really and truly laughed. Merriment rippled around the corners of her lower lips. She seemed to understand that I was a funny sight. She turned several times, and always with the same mild expression of contemptuous humor.

"What's the matter, old gentleman," she was doubtless ruminating, "can't you stay on the stool? Does milking make you dizzy? I could have told you the leg of that stool was in bad shape. You have used it steadily for eleven years and each evening you throw it into the vacant stall. No leg can stand that sort of treatment."

But there were other sides to her nature. I remember, also, the night she was taken very ill from eating something that did not agree with her. I could hear her calling in the early hours of that memorable morning. And she was calling to me. She knew I would help her. In cow language, she said: "Please, please come right away. I don't like to get you out of bed at this hour but cows can't help themselves. I'm a sick Betty. You'll know what to do."

And after I had hung the lantern on the upright and doctored her and brought her around, she gave me a look I shall never forget. It spoke to me a world of gratitude. Her damp nose went scrummaging around for my hand. She was so eager to express her thanks. She wanted to talk.

Yes, sir-e—that Holstein was human. But anybody who knows anything at all about cows knows that they have wise heads on their shoulders. Haven't you found it so?

"I see they have milk in powder form, now, Rastus."

"How's dat, Boss?"

"Oh, you can buy milk just as you buy sugar or salt—in dry powdered form."

"Humph! Dey must do de milkin' wid er suction sweeper, Boss."

DE LAVAL

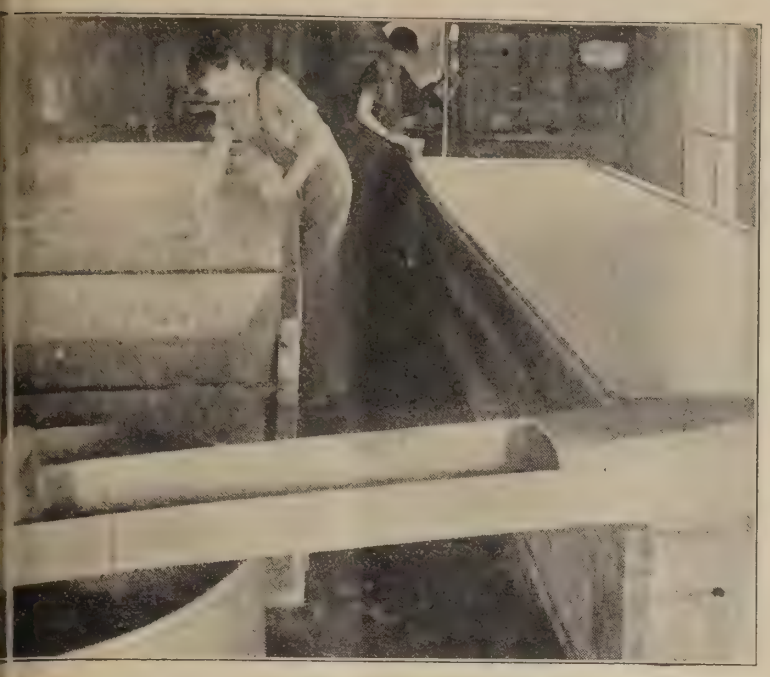
The World's Standard
CREAM SEPARATOR

What does that mean to you?

It means that all over the world men who have had experience with separators and who pay little attention to "claims" and a great deal to "performance" have set up the De Laval in their minds as the "standard" cream separator—the machine embodying the highest type of separator construction and rendering the best service to the user.

It means that the De Laval has more attempted "copies" than any other machine. No "makeshift" copy of De Laval construction or design, however, has ever been able to copy De Laval efficiency or to give De Laval service and satisfaction.

It means that if you buy a De Laval you will get a machine that will give you genuine service. That you will get the cleanest skimming, easiest turning, longest wearing cream separator that money can buy.



Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

Control of Abortion Disease

GEO. M. POTTER, Kansas College of Agriculture

[Continued from last week]

IN speaking of control, a distinction should be made between *control* and *eradication*. In the present state of our knowledge, we cannot truthfully say that the disease can be eradicated, but by methods to be later described it can be controlled to the point where losses are *negligible* and herd efficiency can be maintained.

It is natural, with such an obscure disease, that there should be great difference of opinion, especially regarding methods of control. Some believe that it is a hopeless proposition, but others, among them being some of the foremost veterinarians of our country, believe that by proper methods of herd management and attention to the principles of sanitation, it can be measurably controlled.

We have been groping about for cures, *but there is no cure*. At various times, drugs, such as carbolic acid, methylene blue, and others have been advanced as cures, but after trial have been discarded as worthless. The nature of the disease is such that drugs can have very little effect upon it. Some have claimed to be able to prevent an abortion, where the case is taken in time, but whenever the disease has progressed to the point that symptoms are manifest, the conditions are such that the calf can no longer live within the diseased uterus and it must be expelled. We would not prevent it if we could, for to have the dead calf retained would endanger the life of the cow.

Vaccines are somewhat more promising, yet they are still in the experimental stage, and only extensive use can demonstrate their true value. In many of our contagious diseases, where the animal survives, an immunity remains, and man has been able to induce this immunity artificially through the use of vaccines. In abortion disease, too, there is a decided tendency toward immunity, but our efforts toward developing a satisfactory vaccine have not been crowned with success. Our main reliance, therefore, must be placed upon preventive measures rather than drugs and vaccines.

Control of abortion disease is dependent upon three fundamental principles: Prevention of the dissemination of infection, developing herd immunity, and treatment of affected animals.

Prevent the Dissemination of Infection

It is through methods of herd management that most can be accomplished in combating abortion disease.

ISOLATE THE ABORTING COW AND DESTROY THE DEAD CALF AND MEMBRANES:—The dead calf and its membranes and accompanying discharges are teeming with the germs of the disease. They should be promptly gathered up and destroyed by burning, or buried deeply. The aborting cow continues to disseminate infection in her discharges for weeks, and far more disease is spread at this time than at any other. Consequently, isolation of the aborting cow is of the greatest importance in preventing the spread of the infection. The germs may be conveyed to susceptible cows in many ways where efforts are not put forth to limit the infection. For instance, in the dairy herd, a cow aborting in the line drops the infectious material in the stable, a careless attendant tramps through it, soiling his boots; he then walks up and down the feed alley or climbs into the silo, spreading infection wherever he goes. In the beef herd, on pasture or in the feed lot, the discharging cow contaminates the feed of the other cows. Quite often the aborting cow becomes a chronic "buller", and where the bull runs with the cows, as is commonly the case, he is continually transmitting the infection in an active form from the infected cow to the remainder of the herd.

TREAT THE ABORTING COW—Treat the diseased cow by flushing the genitals as hereinafter described. Immediately after abortion is the one best time for applying treatment, as the uterus closes within a few hours and cannot then be opened, except by an expert, without doing violence to the parts. Treatment is not only for the purpose of promoting recovery, but to prevent serious complications and avoid the dissemination of infection.

CONTROL BREEDING:—Do not permit the bull to serve any but perfectly healthy cows. Discharging cows and chronic "bullers" contaminate the bull, who in turn may carry the infection to others. Under no circumstances should such cows be permitted in the herd.

DISINFECT QUARTERS:—Stalls or other quarters should be disinfected whenever contaminated, because of the danger of the transmission of the disease from the infected environment. Remove all manure and litter, thoroughly clean floor and walls and spray with compound cresol solution, one part to thirty parts of water, i. e., a 3 per cent solution. Any other good disinfectant may be used. Finish by whitewashing, the wash being made thin and applied as a spray. Whitewash itself is a good disinfectant, and it has the advantage of being easily seen, thus serving as an indicator to show the thoroughness of the work.

PROVIDE THE PROPER SANITARY SURROUNDINGS:—Provide clean quarters, for where animals are kept under favorable conditions they thrive and amply repay for added care and attention. In combating contagious disease, sanitation is doubly important. Disease-producing germs live for a long time in dark, damp, filthy stables, and those same conditions are unfavorable for animals, lowering their vitality and resistance toward disease. Disease germs cannot long survive in clean quarters, well ventilated and flooded with sunshine.

FOLLOW PROPER METHODS OF FEEDING:—The pregnant animal must nourish two, herself and the offspring, and certain elements which produce muscle and the bone must be supplied the cow if a vigorous calf is to be born. Starvation, the use of spoiled feed or feed containing certain poisonous principles may seriously affect reproduction, especially in the presence of infection. A varied diet, containing all the elements necessary for growth, must be supplied to the breeding herd to promote vitality and the power to resist disease.

The principles enumerated above, namely, quarantine and treatment of affected animals to limit infection, disinfection of quarters to destroy the infective agent, and sanitary surroundings and proper feed to promote health and resistance to disease, are used by sanitarians everywhere in combating disease, whether human or animal. In fact, success is seldom attained without employing them. *They constitute practically the only effective means we have for controlling abortion disease.*

Develop Herd Immunity

Abortion disease is self-limiting. This fact has been repeatedly demonstrated in herds where there have been severe outbreaks attended by heavy losses. Where the owners did not become panic stricken and s pose of their herds, the disease often subsided as rapidly as it be and the herds have afterward gon reproducing with only slight This happy result came about thro the development of immunity in individual animals. Investigation shown that approximately two-th of the cows that abort lose t calves but once where properly tr ed, and thereafter they become mune. About one-third abort a ond time, and only a small per ce third time. It is true that in herds the disease may continu manifest itself for some time b occasional abortion, a retained a birth, or a case of sterility, but p tically the disease may be said t under control.

RETAIN ABORTING COWS:—Bec of this tendency to become imm the cow that has aborted and thr proper treatment has been rest to health should be retained. Sh more valuable in the infected than a new cow, which in turn m contract the disease. Many a fine has been sacrificed because of the taken idea that abortion can be trolled by disposing of affected mals. *Never sell a valuable bre animal, whether cow or bull, be of abortion disease.* Unprofitable hopelessly sterile cows shoul weeded out on general principles they require attention that shou bestowed upon the good ones. these cows should go to slaughter often they are sold into other h without the new owner being a that they are diseased. This pra of surreptitiously selling disease mals has spread this and other eases, far and wide, and it cann too strongly condemned.

RAISE FEMALE CALVES:—The orous heifer calves which reach turity in spite of the disease ar urally from the more resistant and they seem to inherit this ance, consequently they are les to abort in turn than cows from sources. Raise them. They will building up a herd immunity. improvement can also be se through the use of pure-bred si

DO NOT INTRODUCE NEW BRE FEMALES:—Do not introduce breeding cows into the herd if ble to do without them. Abortio ease persists indefinitely in a where cows are constantly bought and sold. The new cow n either infected and a spreader ease, or free and susceptible to the former case she introduce infection, and the owner has nothing by exchanging aborte the latter, a new victim has added to the herd. Abortion may be likened to a fire, wh new fuel is not constantly adde dies down. Herd immunity is oped, therefore, by retaining t mune cows, raising the calve avoiding the introduction of i cattle.

The foregoing practices hav found effective in preventing ination of infection and devo immunity to abortion disease in herds.

Treatment of Affected Ani

THE USE OF VACCINES, BAC ETC.:—The ideal method to contagious abortion, reasonin analogous treatment in other gious diseases, would be by v tion, and many such agents the market under the name of v bacterin, abortion, etc. The ma turers claim excellent results f use of their products. Some g as to issue a guarantee to e disease or refund the money. of this, careful unbiased inves accord but a very low immuniz ue to these agents. They h

PRIMROSE OF SCHLESWIG 2D, NO. 26500—OWNED BY F. F. THIELKE & SON, WISCONSIN
Record: 9,244.7 lbs. milk, 567.9 lbs. fat.

This pure-bred Guernsey won first place at the 1918 Wisconsin State Fair for the cow producing the most fat in a year's test in a Wisconsin cow testing association and entered for contest and exhibit. The feed consumed during the year consisted of 5 months pasture, 8,228 lbs. silage, 1,569 lbs. alfalfa hay, 395 lbs. clover hay, and 2,710 lbs. of a grain mixture consisting of gluten feed, oil meal, and bran. According to the association records this feed cost $104.91, while the value of fat produced was 61.7 cents per pound, or $350.26. This cow made a profit over feed of $245.35 and returned $3.34 for each dollar spent for feed.

Primrose was bred and raised by Thielke & Son, and her record is therefore of greater credit to them. Concerning the herd of which she is a member, Mr. Nander Nelson, the tester, writes:

"There are 18 Guernsey cows (13 registered) in the Louis Corners Guernsey Farm herd, of which Mr. Thielke & Son are the proprietors. The whole herd is of a uniform type and color and has made many good records the past three years in the New Holstein—Kiel Cow Testing Association. For the testing year ending March 31, 1916, this herd was first with an average production of 379 pounds fat. The next year, ending March 31, 1917, average production was 349 pounds fat, and the past year the average production of 18 cows was 369.3 pounds fat. Seven cows from this herd qualified and were entered in the Register of Production, which makes this herd one of the highest producers not only in Manitowoc County, but for the state of Wisconsin."

ensive Farming by the American Red Cross in England

CAPTAIN FRANK S. PEER

H Jersey cow was my first love,—
least among animals of the bo-
family. I look back on the day
e I secured my first Jersey cow as
letter day in my experience as
der. This was 'way back in the
l seventies.

ill recall most vividly my first
o the Island of Jersey in the
h Channel. It was in the spring
)2. I had been spending five or
eeks en route via the Azores,
gal, Spain, and France, and I
ssure you that I never was so
d to reach a place as I was at
ne when at last I set foot in a
where I could hear my native
spoken.

e that day my fondness for the
has "grown by what it fed up-
American farmers will forgive
r indulging in these personal
scenses, particularly when I
s to them that I am writing this
birthday. I am not going to say
one, as I do not care to see it
sed in numerals. I am feeling,
ard to my age, something like
cattleman I knew near Roches-
Y., who, when asked his age,
, "Well, really I most forgot,
near as I can calculate, I am
69 or 96. The truth is," he
reflectively, "I've been afraid
k in a glass for the last ten
for fear I would be tempted to
the wrinkles on my horns, and
might learn for a fact I was 96
l of 69."

r Jersey, I came to love Guern-
so. For several years I have
little home there. For twenty-
ars I have spent considerable
each year on these two beauti-
nds. Of course they are chief-
ble in the farmer world as the
f the Jersey and Guernsey cat-
One of their most attractive
s to me has always been the
ful production of the soil. I
ways been something of an en-
t on the subject of intensive
ture, and in this respect I be-
hese two little islands stand
nd shoulders above any equal
e of farming land in the world.
are endeavoring to install this
ype of intensive agriculture at
spital farm at Sarisbury, Eng-
Here the American Red Cross
chased an estate of 186 acres,

about 1,500 to 2,000 head;
dairy, where the milk will be
d, bottled, and sent to the

ne thing that induced me to
ke to set up a farm organiza-
tion at Sarisbury hospital was that with the experience I have had in Guernsey and the years of observation of Channel Island methods of intensive agriculture, I hope to be able to demonstrate that the same principles of intensive agriculture are as practical in Great Britain as they are in Jersey and Guernsey.

At present the Sarisbury farm is in a low state of cultivation, and a good deal of hay, straw, and grain must be bought for several years before the farm becomes self-sustaining for the number of stock we have installed. But that does not worry me, for I have been through the same mill on my Guernsey farm and feel that what has been done can be done again.

The art and science of agriculture consists in taking the highest possible yield per acre from the soil while leaving it in as good or better condition for the ensuing crop. On this basis, the farmers of the Islands of Jersey and Guernsey may be said to stand at the head of their profession. Speaking from memory and in round numbers, I believe the Island of Jersey contains about twenty thousand acres of tillable land, including orchards and gardens, with a pre-war population of 55,000 and 40,000 to 50,000 visitors annually. The Island also supports 12,000 cattle, 7,000 horses, and 10,000 swine, to say nothing of goats, sheep, dogs, and poultry. This figures out at about 3 persons and 1½ animals for every acre of land farmed. The marvellous feature, however, is that this 20,000 acres not only largely supplies all this number of people and farm stock, but in addition provides for export five to ten million dollars' worth of agricultural products yearly.

A model farm, according to the latest American ideas of intensive agriculture, is being established by the American Red Cross on the grounds surrounding the American hospital at Sarisbury, England. This farm is in charge of Frank S. Peer of New York. Of the little patch of ground shown herewith, Mr. Peer said: "We have just completed a week's feeding for ten head of full-grown cattle on seven square rods of oats and peas. The land was formerly a vegetable garden. The oats stand over 5 feet high; the land would probably grow at the rate of 5 tons per acre."

Frank S. Peer, director of the American Red Cross Farm, with one of the Jersey cows which furnishes milk for the big hospital at Sarisbury, England.

I doubt if there is a finer example of intensive agriculture anywhere in the world. The little Island of Guernsey does even better per acre than Jersey, but she has something like 700 acres under glass, while Jersey is strictly confined to straight farming.

The Channel Islands, then, are an object lesson in agriculture and horticulture to all the world, and especially to Great Britain. Now that the British government has committed itself to a policy of encouraging small farms for the purpose of keeping its young men at home, there could be no better schooling for the embryo farmers than to send them to the Channel Islands for a time as farm pupils before putting them on a farm of their own.

I am sometimes almost afraid to tell the truth in England regarding the size of the crops the Island farmers are able to win from their soil, for it sounds like a fairy tale. Here is what these farmers are getting per acre:

Potatoes	300 to 500 bushels
Wheat	50 to 75 bushels
Oats	75 to 150 bushels
Hay	3 to 5 tons
Roots	50 to 100 tons

If what has been done cannot be done again—we mean at least to give it a try at the Red Cross farm at Sarisbury. If it fails we may have the satisfaction of knowing why.

Our cows, as has already been told, are a donation from the farmers of the two channel islands. Jersey has given us thirty of its finest blooded dairy cows, and Guernsey has given us the same number. About four of the cows from each of the islands were given outright by individual farmers, the pick of their herds. The rest were provided by individual subscriptions, running all the way from $1 to $125. The subscriptions in Jersey reached a total of about $8,500 and in Guernsey about $6,000.

Twenty of these cows have already been delivered, and in the first few weeks the cows themselves have added several fine calves to our stables. The remainder of the herd will be delivered to us just as fast as our stabling accommodations are completed.

The first cow donated in Guernsey was given by Mr. and Mrs. E. A. Best of the "Brickfield Farm", who contributed their finest cow—"Guilbert's Rouge of the Brickfield".

I have before me the minutes of the first meeting of farmers on Jersey to start the gift of cows. It may be interesting to American farmers to see what some of their Jersey brethren had to say on that occasion. Thus I note that the secretary, H. G. Shepherd, in opening the proceedings, said:

"We have met here today to think over and discuss what part we, as a society of an island, can take in providing cows to give milk to the wounded American soldiers who will be in hospital at Southampton. Our American friends are linked very closely to us. For years past they have bought our cattle and we on our part have been pleased to sell to them. It will therefore be a gracious and proper act, now that they require cows to give them milk, for us to provide them.

"The Americans have fought side by side with our men for right and liberty and for the old flag of England and for justice. I am sure that the farmers of the Island will make it a point of honor to assist these American soldiers and sailors who have helped them to keep their homes together.

"The hospital erected close to Southampton for wounded men is in need of milk, and if this is needed to bring back health and strength to the wounded men of America, they can find no better milk than that of Jersey.

"We should make this gift without idea of our own interest and profit, for our friends in need should have the very best we can give."

One of the farmers, Mr. J. A. Pearce, followed by saying: "America has spent money lavishly since she entered the war, and even before that she had been feeding Belgium and France. The Americans have denied themselves to supply us with food. I think that all work in connection with this gift should be voluntary, and if the necessary amount of money is exceeded, there will be plenty of ways of spending it for devastated France."

F. E. Luce, another prominent breeder, said: "This is a Red Letter day in the history of our Island and society. Our farmers have benefited by the American dollars in the days of yore and they will now generously support and help the wounded Americans who fought for our cause."

[Editor's Note:—Mr. Peer, who has recently been commissioned a captain in the field service of the American Red Cross in England, is widely known in America as an expert in cattle breeding and intensive farming. His "international farm" on the Island of Guernsey in the English Channel is a famous show place and

68 West Kinzie Street, Chicago, Ill.

Sanitary, Economical, Durable

MECHANICAL REFRIGERATION

For Creameries, Milk and Storage Plants.

Vertical Twin Cylinder Refrigerating Machine.

Modern methods demand better sanitation in creameries, milk and storage plants. The imperfect system of "ice cooling" will no longer answer. Aside from the troubles arising from ice cooling, after the first cost, mechanical refrigeration is more economical. The difference in the cost of operating an ice machine and that of ice to do the same work, will soon pay for the installing of a refrigerating plant. Every creameryman knows the importance of temperature control, not only in the cooling room, but in the cream ripening process. With mechanical refrigeration you have perfect control at all times.

HORIZONTAL machines in all sizes from 6 TONS to 750 TONS daily capacity. If interested write for bulletins.

THE VILTER MFG. COMPANY, 874 Clinton St., Milwaukee, Wis.

When Writing to Advertisers, Mention Hoard's Dairyman

"Hebe" Milk Likened to Oleo

CHESTER C. FARR, WASHINGTON

SEVERAL farmers' papers are carrying a full page advertisement from the Hebe Company of Seattle and Chicago, proposing that the county agents and other extension workers, in behalf of the farmer whose "interests they are guarding and to whom they bring all that is of immediate practical value in our scientific teaching, should become informed about the new product Hebe and its benefits to the dairy industry."

The county agents in dairy sections should know more than what has been said in this article about this new product, but which truly is no friend of the dairymen. Hebe is another friend to "oleo". He wears a tin jacket this time instead of annatto paint and oil paper. Hebe is made from skimmilk, it is true, but from whole milk purchased from the farmer, skimmed at the factory, incorporated with imported cocoanut oil to replace butterfat and the butterfat itself thrown back onto the market as butter. This company which purchases millions of pounds of whole milk each day on the Pacific Coast virtually has control not only of the fluid milk market, but also the butter market as well.

This cheaper fat which replaces the butterfat is a vegetable oil and as such has recently been proven to be an imperfect growth producing food substitute. The recent investigations of Dr. E. V. McCollum of Johns Hopkins University, who is recognized as one of the greatest authorities today on dietary matters states: "We are not to speak of fats in our discussion of nutrition without recognizing that all fats are not of equal value to the animal during growth." To further explain this he says: "A butterfat substitute is not equal in its physiological properties to an equal amount of butterfat. It may possess as much energy and be as easily digested, but it will in no way perform the functions of growth." "So far as is known the only substances among human foods containing this are butterfat, eggs, and a small amount contained in meat." From this statement it is clearly shown that Hebe, containing none of the properties necessary for growth, cannot take the most valuable place of milk, that of food for growing children. This should be made clearly plain to every community. Those communities that are ordinarily poorly fed are usually those whose personal finances force them to purchase cheaper foods, and the package containing an equall, clean product, of equal volume and appearance, without making the purchaser conscious of the most recent information regarding its food value, will sell the more readily. These same purchasers are those who seldom buy meat or eggs at present prices, but a milk product is a part of every child's diet, and to supply it with this in face of present scientific knowledge of nutrition is to add materially to its improper health and growth.

In this respect the recent investigations of Professor O. F. Hunziker, embodied in his "Condensed Milks and Milk Powders", pages 177 and 178, states: "Nor does imitation condensed milk, such as 'Hebe' product, in which the butterfat has been replaced by a vegetable fat, supplement the lacking fat soluble accessory substance. The public should clearly understand that in milk or condensed milk, there is no substitute for butterfat and when the butterfat is removed the product no longer can take the place of milk."

And again it is made clear as to the best knowledge regarding Hebe as a food that "Experiments conducted at Ohio State University by J. L. Hutchinson, instructor in the partment of Agricultural Chemi under the direction of Professo Erf, Chief of the Departmer Dairy Husbandry, and Dr. J. F. man, Professor of Agricultural C istry, demonstrated that "Hebe" when fed to young white rats re ed in malnutrition accompanie stunted growth, sore eyes, and of some of the experimental in a similar manner as did othe tions in which the fat soluble mines were lacking.

Hebe milk has undoubtedly manufactured in this section ciently long to show its merits dairymen's friend. It was man tured here first and came into mercial life in these plants whic the farmers' milk. At this tim attitude of the dairyman here is thing but friendly toward "H He has failed to receive any market for his dairy products th sections where "Hebe" is not m factured, and his market has poorer than in some sections "Hebe" is not made. The dair feels and frequently expresses t lief that the Hebe product not acts as a means of lessening the sumption of his normal cond product, but also will lower the terfat market by placing on the ket the surplus butterfat which wise would have been consum milk in addition to the norma terfat demand, and thus the b fat supply is increased beyond n consumption. Certainly this p is not popular in its own home try.

Supplies of Cottonseed and Meal

HOARD'S DAIRYMAN:—With t minent abandonment of a majo regulatory price measures adop the government at Washingto ing the war, dairymen are nat wondering whether or not cott and linseed products will be af It is the claim of manufactur these feeds that the market wo on a higher basis than now qu not held in leash by fixed schedules. Still, the fixed pric much higher than in pre-war da view of this fact, it is well for men to take a glance at the con which prevail in the trade in seed and linseed cake and meal, are highly important concentra

An acute shortage prevails i cottonseed meal and cake and meal and cake in the face of a and urgent demand from live producers. First of all is the yields of both cotton and flax the United States this year which buyers of the by-produ commodities have been forced tend.

The production of cotton United States this year am to only 11,700,000 bales, co with 11,302,875 bales the pr year and a five-year average tion of 13,327,000 bales. The 1917 was the smallest on reco the production this year, only greater, has forced crushers of seed to operate without any over or possible surplus. The e timates of the Department of culture on the prospective 19 ton crop gave hope of a yield than 16,000,000 bales, but drouth sharply reduced the act turn.

American farmers, princip the Northwest, harvested a flaxseed this year of 14,657,00 els. The yield in the precedin

nunted to only 9,164,000 bushels, u he average for the 1912-1916 five- e: period is 17,600,000 bushels. rvers of flax have become dis- naged over crop failures the past e years, and the acreage devoted to ne crop has greatly diminished. Up o 909 yields of flaxseed in this ntry were comparatively large, u after that year, except in 1912, hi 28,000,000 bushels were pro- u-d, harvests have been light. The 9. yield of only slightly more than 0,000 bushels was the smallest on e d, while a crop of even 14,000,000 u els is far insufficient to supply e s of the crushing industry of this u try.

e following range of maximum ri s, fixed by the United States o Administration, prevail on cot- r ed feed: For Oklahoma and e s points, $50 for 36 per cent pro- i meal, $52.50 for 38.5 per cent e in, $55 for 41 per cent, and $57 r 43 per cent protein feed. In Ar- nas and states eastward, the price $ per ton higher than in Oklahoma exas.

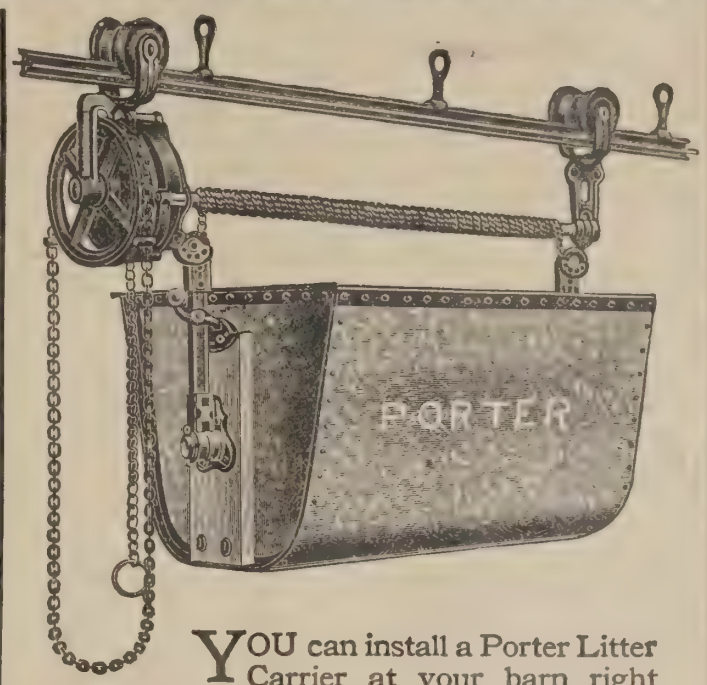
Oklahoma is practically out of the a et as far as supplies of cotton- e cake and meal are concerned. All i., as a rule, are sold ahead for e maximum period of 60 days al- 1 by the Food Administration. n in Arkansas, Texas, and other t n belt states, the available sup- y of cottonseed cake and meal is compared with the outlets. e range cattle breeders and feed- s re in the market for heavy quan- i , but only those who entered the market have been able to obtain than an occasional car of the The experience of the preced- year, when buyers withheld pur- s until winter had approached then found themselves unable to t n supplies, owing to a generally at demand, congestion of trans- tion, and shortage of cars for ng freight material, has made e cattle handlers eager to enter arly market. But this is not par- arly true of the small feedlot cat- andler. He is rather disposed to in ton lots, rather than in car- , willing to stand the heavy added se incident to making the small ase. Such a situation is due, it lieved, to uncertainty and nerv- ss over the future of the market at bullocks and beeves in general, r than to any apparent hope of prices for cottonseed products. ed prices on cottonseed allowed e United States Food Adminis- n are abnormally high—the at which the mill obtains its lies will average about $70 a Crushers of cottonseed prod- maintain that there is not suffi- profit in the industry with seed s at such a level, and much dis- nt prevails. The crushers point e lower oil content of the seed re- g from drouth. Cottonseed oil s also are fixed, the only prod- having no set price being the But, of course, these commod- must naturally sell, owing to re- l feeding value, at a lower level the meal and cake. Owing to ight yields of cotton, a shortage ed is anticipated before the end e crop year.

other factor which tends to re- the operations of crushing s in the cotton belt is the acute ity of labor. Many mills in the have been forced to reduce their ting capacity to half normal, and in the face of an exceptional de- for the feeds, is further aggra- g the situation.

rmally, a large portion of the ction of cottonseed cake and in the United States is exported urope. Germany, Holland, and um were heavy buyers of cotton- cake and meal from this coun- rior to 1914, when the world was plunged into a great war. There is considerable talk today of a resumption of this export business, but close students of the trade situation declare it is needless to give even slight consideration to the possibility of an export outlet. For nearly a year and a half, there have been practically no exports, and the ban on foreign shipments continues. This is of especial interest to the grain trade, for the European countries which normally depend on vast quantities of cottonseed cake and meal may be forced to buy more corn from the United States to take the place of the high protein cottonseed feedstuffs.

The flaxseed situation is not encouraging in the least. Even on a normal yield of the product, crushers in the United States are forced to turn to other countries of the world for supplies. Argentine, India, and Canada before the world war found a broad outlet for their yields of flaxseed in the United States. What, then, can we expect under a situation with a short yield, no carry-over from the preceding year, an embargo on imports from Argentine, and a light movement from Canada?

A late ruling of the War Trade Board at Washington announces that import restrictions placed against flaxseed shipments to this country last July have been modified to permit the issuance of licenses for importation of this commodity when originating in the River Platte district of Argentine and Uraguay, in a total amount of 20,000 tons prior to January 1, 1919, and 16,000 tons for each month of the first four months of the next year. While this will aid appreciably the domestic situation, conditions will still remain far from normal. There is hope that the War Trade Board will, after January 1, rescind entirely its regulations against imports from Argentine, to which country the United States looks for a large portion of its supply. The Argentine crop, however, is not available until March or April, and heavy imports before that time are doubtful. Europe will be a heavy buyer of Argentine flaxseed, owing to need for linseed cake and meal to feed the starving herds. India's crop will doubtless find its principal outlet in the United Kingdom. Europe's requirements are unusually large, owing to general feed shortage and reconstruction of the dairy and general live stock industry of the Old World.



Duluth is receiving the greater portion of the shipments of flaxseed from the country. The movement as a whole is light, and it is doubtful whether crushers either in the East or West have accumulated sufficient stocks to carry them through the winter. Shipments to the East via Lake routes already have ceased.

Linseed meal is quoted at a maximum of $56 a ton, basis Minneapolis. Most of the crushers are sold ahead for 60 days, and numerous orders for the commodity are being refused owing to lack of supplies. A favorable factor in the trade is the outlook for an enormous demand for linseed oil with the resumption of building operations throughout the United States.

Not a few dairymen in the country are forced to substitute other feeds for the cottonseed and linseed feedstuffs, being unable to obtain an adequate quantity of the concentrates. In view of the government's refusal to change bran and shorts prices, its fixing of hog prices and its desire to help enlarge the food supply, it is doubtful if present fixed levels on cottonseed and linseed feed will be removed or even modified until at least another crop becomes available. The belief prevails that government control of prices will continue until feed, live stock, and allied industries adjust themselves to peace conditions. But

Porter Litter Carriers

YOU can install a Porter Litter Carrier at your barn right now—cold weather need not be considered.

And the Porter Litter Carrier will save you time and labor on the farm's "toughest" job in the most disagreeable time of the year.

As for expense, it is not to be reckoned in comparison to the saving a Porter Litter Carrier makes possible.

"Simplicity, Sanitation, Durability"

No complicated mechanism to get out of order, no weak parts to wear out quick.

They are practical, efficient helps—the kind that go to make farming pay.

Readily operated. Dirt and weather proof. Tub tips either way. Run on Columbian steel track. Convenient, reliable.

Use Porter products for your barns—stalls, stanchions, pens, hay carriers, door hangers—every tested farmyard betterment made in the better way.

Your dealer can give you specifications. Write for our catalog.

Association Notes

Polk County, Wisconsin:—Two unprofitable cows were sold. Three new members have joined this association, one having a herd of pure-bred Swiss. The creamery paid 75 cents per pound fat. The feed prices are about same as last month.

Lake County No. 1, Illinois:—Cows are being fed winter rations now which improves their milk flow. Oats, barley, and oil meal are the chief grains fed. In December market milk sold for $3.77 per cwt. The average test required was 3.5% and for each point above 4 cents were paid. The creamery paid 72 cents per pound fat. Butter retailed for 67 cents per pound. Feed prices: Oats, $48 per ton; barley, $43; oil meal, $66; bran, $35; gluten, $59; alfalfa, $35; clover, $34; silage, $8.

Middlesex—Somerset, New Jersey:—Belleview Farm has a grade Holstein 8 years old showing a year's production of 11,907 lbs. milk containing 429.1 lbs. fat; fresh Dec. 5, 1917. The value of the milk was $433.96 and feed cost was $160.73, showing a profit of $273.23. Six pure-bred cows and eight pure-bred heifers have been bought this month and 12 boarders sold. There are 15 pure-bred bulls in this association.

Rutherford County, Tennessee:—Ten cows have been sold as unprofitable, two new barns are going up, one silo bought, one registered heifer bought with great production back of her, one pure-bred bull purchased. All members, with very few exceptions, are putting more enthusiasm in the work and are feeding and caring for their cows in a way which pleases. Needless to say production is increasing in most herds. The creamery paid 67 cents per pound fat. Silage costs $5 per ton; cowpea hay, $25; soy bean hay, $25; alfalfa, $28; bran, $2.40 per cwt.; cottonseed meal, $3.10; corn and cob meal, $1.40 per bu.

Rutland County, Vermont:—Five unprofitable cows were sold for beef, five other cows sold, and five registered cattle bought. Eleven herds are being tested for tuberculosis. In November market milk sold for $4.78 per 100 lbs.; test, 5%. Creamery paid 72 cents per pound fat. Feed prices: Unicorn, $70 per ton; bran, $45; cottonseed, $60; hominy, $72.50; molasses, $55; oat feed, $40; oil meal, $62.50; hay, $12; silage, $6 to $8.

White River, Vermont:—Golden Oxford Browne, a Jersey of Quechee Fells Farm, again leads the state for November. She has led in fat production several months. From April 8th to December 1st she produced 9,030 lbs. milk containing 567.7 lbs. fat.

Arkansas Valley, Kansas:—On Dec. 14th Arkansas Valley Association met and settled for 1918 and second year work and organized for 1919. Claud Wehrman, tester, stays with association for another year. He makes more clear money on a side-line than as wages. He buys go cows and puts them out on nal with a good caretaker. Result is th good grade cows paid for themsel in 1918 and he bought one registe at auction here Dec. 12 for $500, to handled on same terms. Every me ber of association use a pure-b bull.—F. L. H., Wichita, Kans.

New York Dairy Notes

HOARD'S DAIRYMAN:—As Dece ber advances and farmers are wo ing hard to catch up the work, feeli unusually pleasant over the mont income for milk, they seem to be vided between real satisfaction a certain dismal forebodings. They getting average cost of produc milk, but there are rumblings of proaching trouble. The city dai are stirring up discontent in the ci by publishing sensational trash garding the profiteering of dairym and the alleged conspiracy of p ducers and distributors to multch public in high prices for milk. Inve gations are in process to prove vi tions of laws in setting league pri and by dealers in respect to re milk, particularly the former.

As a result of this agitation th is a decrease in buying milk as a taliatory measure on the part of public. Poor people are said not to able to get milk on account of pr and they are doubtless buying les it, whether from necessity or f choice. Doubtless it is commonly f choice and the choice is due to ag tion. Where a wrong exists it is to make it known, but to contend t dairymen are getting abnormal pr ought not to be urged to the ex that it is without first finding such is really the case. It is doin world of harm to dairymen. If were all we could simply protest, it is also harming the consumers causing them to use too little milk their own good.

Uncertainty as to Future Mar

Farmers are becoming somev alarmed over the city attitude. do not know what the result will President Cooper of the Leagu the other day that there is a shortage of milk. Some of the c ers say there is a surplus. Cer creameries and stations are b closed. There is turmoil and anx in many quarters. Uncertainty se to be supreme. Somehow our problems seem to multiply and t is a good bit of need to be in gre readiness for all sorts of emer cies. A farmer-owned creamery fine thing but that is not enough needs an all around equipment, a needs experience and training to dle it. This the farmers should d

Nestle Company Absorbs Compet

The condensing, evaporating, dry milk business are all factors in our milk territory. The dry people appear to be coming to

rt somewhat. About all the con-
e ing would now seem to be under
n control, which is disconcerting.
veral years ago the Anglo-Swiss
o lensed Milk Company was oper-
ti g somewhat in this country. It was
e rted that they and the Bordens
n red into an agreement by which
h Anglo-Swiss were to stay on the
t side of the Atlantic and the Bor-
e this side. Within a short time back
h Nestles Company, an English cor-
o tion, has absorbed the Anglo-
w s and, if reports are correct, has
a n under control the condensing
n evaporating concerns of this
o try. This concern, the Nestles, is
n her cause of worriment in the
i situation. They are too strong
n may doubtless do harm. They
a the power. And so we worry
c g. The Bordens are said to be
o ng plants and striking further
e in the hope of securing cheaper
i. In a few days there may be
o sunshine in the situation. At
r rate e are doing fairly well in
e mber and perhaps we may as
e enjoy the comfortable feeling
h it lasts. It is not wise to be-
r too pessimistic, only a little so.
eds are advancing very consid-
a y. Many have thought we would
e a decline and some of us who
r put in a supply for the winter
r almost felt sick of the bargain.
oks now like a saving of five or
r lollars a ton on most of the pur-
a es. There are no wheat feeds and
a / of us are using ground oats.
n e cost nearly sixty dollars and
a is too much, but we pay it be-
u e we get nothing to take its place.

January Prices Not Fixed

Since I have commenced to write I
had a talk with one of the head
e among milk dealers. He expect-
s to get an agreement on January
l prices before this time, but there
s been a hold-up. The League
rs and the dealers seem willing to
t into an agreement, but the Food
l inistration appears to have with-
a n. The dealers say they do not
n to make a bargain with the
a ue without some legal authority
n npire, for doing so renders them
l to fine and imprisonment. The
a ue officers are exempt from pun-
n nt for such action by the law of
w winter, but not so the dealers.
i is the dealer's attitude. Once
l ight have thought it a policy of
a to bring this up, but now we
e inclined to think there may be
a n for the contention, especially
t the absurd comments of the city
e and of the investigating attor-
y office.

I does not appear at this moment
t the dealers are likely to contest
e eague price, although a day now
c change the situation. This deal-
w hom we have known for some
a and who is regarded with confi-
n , claims that the retail milk
l et has not been cut more than
e r two per cent by the December
r ice in the price of milk. There
s een a large decline in consump-
s since last August, he says, but
d not seem to attribute it so
l largely to advancing prices.
e are various views to take. He
t ts a surplus of milk much of
m me from now until next August.
t s be true, it looks a bit dubious
f r dairymen. Much now depends
e manufacturers, especially con-
s s. Butter and cheese can hard-
l us out on the present plan of
e prices except possibly in June
l little each side of that month.

abbages a Good Milk Feed

re may be too much milk pro-
even now, and the prospect is
ger production. We market but
xcept milk and a few potatoes
bbages. These two productions
are in over supply and there are really no markets for them.

Speaking of cabbages, only a few have been sold from our section this year. The price at the car has seldom been above thirteen dollars a ton, and most of the time only ten. There is a general opinion here that at anything less than fifteen dollars, the cows ought to get the most of them. Some dairymen assert that at the present price of feeds, cabbages are worth twenty dollars a ton. I have yet to learn of a dairyman who is not enthusiastic in reference to feeding cabbages. They are milk producers and not a difficult crop to grow. They are said to put on flesh as well as produce milk. It is a good deal less labor to harvest the crop if fed to stock than to prepare it for market, although when the prepared heads are sold there is quite a bit of refuse that may be fed. Saving labor in harvesting and in hauling to market is a good bit of an item.

New York. H. H. LYON.

Iowa Milk Prices

J. V. Lingenfelter, General Manager of the Iowa Dairy Marketing Association, Des Moines, has recently issued a circular letter to the members of that association, from which we take the following:

"It is with no little pleasure that we again advise you of another increase in the price of milk, effective January 1, 1919. The price will be $3.75 for 100 lbs. of 3.5% milk, with the 5 cents per point up or down. The distributors have been convinced of the wisdom of our demands and accept without protest this increased price. While the raise is beneficial to the farmer, the price of retail milk will not be affected.

"With these nice advances over our old, ineffective, individual methods, it seems to me that much has been accomplished within the past year. Few, indeed, would be willing to go back to the chaotic conditions existing before we had the organization.

"The past year has been one of many problems, but with your splendid support much has been accomplished. With an average price above $3.40 per 100 lbs. for milk for the year, and beginning another year with the price above announced, a membership of nearly 800, no debts over us, a nice surplus in the bank, we indeed have reasons to be proud of our efforts. With a loyal membership and your hearty support, we have much to look forward to."

Feed Rich in Protein Needed

Please tell me how I can make a good dairy feed out of corn, oats, and barley that I have on hand. Will I have to mix some other kind of grain to make a good milk feed? I have silage and mixed hay for bulk. Have a few cornstalks in the barn.

Marine City, Mich. C. W. K.

We would suggest a mixture of 200 lbs. ground corn, 200 lbs. ground barley, 200 lbs. ground oats, and 150 lbs. of oil meal to supplement the clover and timothy hay and corn silage. We would let each cow have daily about 30 lbs. of the corn silage and all the hay she would care to consume without waste. Feed about 1 pound of the mixture suggested for each 3½ lbs. of milk produced.

If oil meal cannot be obtained, then we would suggest using 200 lbs. of gluten feed instead of oil meal, or 150 lbs. of cottonseed meal. It is necessary to select some feed rather rich in protein in order to supply an adequate amount in the ration so that the cows will do good work.

Small But Important—

The service you get from ready roofing depends not upon the roofing alone. In the long run the roofing is no stronger than the materials which hold it in place. So the next time you buy roofing don't overlook those small but important items which are packed in the center of the roll—lap cement and nails.

Good lap cement must spread smoothly when applied. It must hold the edges of the roofing together *flat*. It must be water-proof and weather-proof. *And it must retain all these qualities throughout the life of the roofing.*

Ru-ber-ine Lap Cement has been specially prepared for use with Ru-ber-oid Roofing. Its composition is such that, when applied, it unites with the roofing itself and *practically welds the sheets together.*

The nails must be strong enough to drive home without bending. Their heads must be large enough to hold the edges of the roofing firmly without danger of tearing. *And they must be rust-proof.*

Ru-ber-oid *Sherardized* Nails are *absolutely rust-proof.* By the patent process of Sherardizing, the zinc coating is practically *soaked into* the base metal and stays there. Ordinary galvanized nails are *not* rust-proof because the protecting coat flakes off and exposes the under metal. The nails which are sold with over 60% of prepared roofing are *neither* Sherardized nor galvanized. All the more reason why you should buy Ru-ber-oid and be sure of the best.

Ru-ber-ine Lap Cement and Sherardized nails are manufactured to measure up to the same high standard of excellence that has made the name, Ru-ber-oid, representative of *the best* in ready-roofing.

Turn Water Into Milk

Get More Milk on Same Feed

Improve Cow Health

Prevent Contagious Diseases

MILK IS 87% WATER

That's what you can do with your dairy cows, besides saving a lot of time and labor in watering, by installing this most up-to-date system of stall watering—

Libbey Automatic Water Bowls

Milk is 87 per cent water and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15 to 20 per cent, which soon pays for the bowls.

Libbey Bowls are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circulars, prices, *Free Daily Milk and Feed Record.*

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

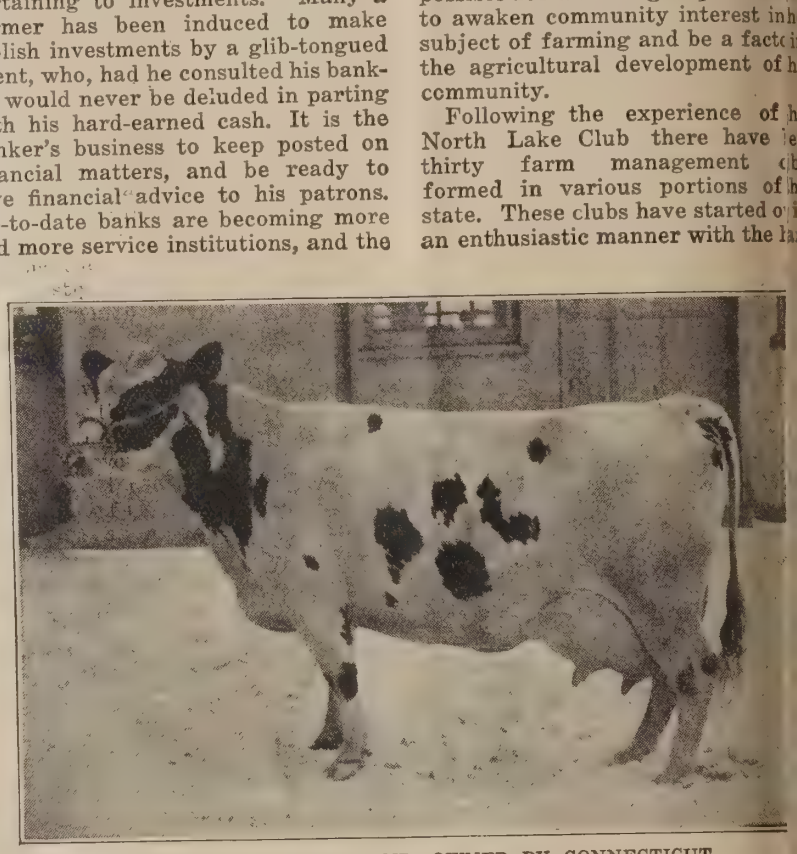
Farm Management Movement in Wisconsi

D. H. OTIS, Wisconsin College of Agriculture



FARM management clubs have been organized in Wisconsin for the purpose of enlisting the co-operation of the banker and the farmer in a study of the business management of the farms for the purpose of increasing farm profits and encouraging farmers to do business in a business way, through the banks. There are probably no two classes of people who are more dependent on each other than the banker and the farmer. The country banker is dependent upon the farmer for the largest share of his banking business. The farmer is dependent upon the banker for a place to deposit his receipts, for loans to tide over certain periods of the year, and for advice upon financial matters pertaining to investments. Many a farmer has been induced to make foolish investments by a glib-tongued agent, who, had he consulted his banker, would never be deluded in parting with his hard-earned cash. It is the banker's business to keep posted on financial matters, and be ready to give financial advice to his patrons. Up-to-date banks are becoming more and more service institutions, and the farmer fails of his opportunity and privilege if he does not avail himself of this service.

During the last few years the bankers have taken a keen interest in the farmer and his business. They have not only loaned him money, but they have helped him to get better seed and better live stock. The Wisconsin bankers have published the Bankers' Farm Bulletin for the benefit of their farmer patrons. These bulletins have been full of helpful suggestions in matters pertaining to the farm. The bankers have also helped in arranging for banker-farmer meetings both locally and at Madison, and have provided programs full of practical suggestions for enterprising farmers.

During the past two years the banks have shown special interest in getting their farmer patrons to keep inventory and financial records of their business transactions. In order to do this effectively, farm management clubs have been organized with the banker usually acting as secretary and treasurer. The farmer who comes into these clubs promises to keep his records and study the results at the end of the year. In order to defray the local expenses of this work the farmer has paid a $2.00 membership fee. This fee has been used to cover the expense of his account book, the expense of collecting the account books at the end of the year, and also the expense of figuring out a factor sheet, showing where each man st in comparison with the average best at the end of the year.

One of these clubs, North Lake, a been running for three years, and interest and growth of the clu shown in its membership. It sta out with 22 members, the second this was increased to 30, and at beginning of the third year to 60. club has been instrumental in sti lating interest in farm managen problems in that community. In fall of 1917 it pulled off what called a "Banker-Farmer Mixer" the county. It provided an excel program and by vigorous adverti succeeded in getting 3,000 people This club has demonstrated that possible for a small group of far to awaken community interest in subject of farming and be a fact the agricultural development of community.

Following the experience of North Lake Club there have thirty farm management formed in various portions of state. These clubs have started o an enthusiastic manner with the l

...Cream, the Soldiers' Symbol of Home

...Ice cream in France has always ...been made more or less to pamper the ...particular taste of American tourists, ...now, of course, with the scarcity ...of milk it is a thing practically un...known. From the moment the Yank ...sets foot on a transport, ice cream be...comes one of the poignant memories ...of home, a symbol of all he has left ...behind, and a dangerous thing to men...tion. The word brings up a picture of ...docks and side porches and mother and best girl and everything like that.

An American soldier, blinded by gas, had been brought after weeks of torture to a hospital in the suburbs of Paris. Into his world of pain and darkness came suddenly one day the quiet voice of an American woman: "Wouldn't you like some ice cream?"

With quivering face he lifted himself from his pillow. "What!" he said excitedly, "is the war over?"

It was a woman from the Soldiers' and Sailors' club who put a dish of ice cream into that blind boy's fumbling hands. The directors of the club had asked themselves: What would give wounded doughboys the most sheer, undiluted joy? There was simply one answer—ice cream. "Why," said Mrs. Beekman on a hot September day, "if the American army thought there was ice cream in Berlin, it would be there next week!" So the club started its plan of taking ice cream to the Paris hospitals. The club originated the idea and gives the service; the Red Cross generously contributes the ingredients for the treat.

An American had been brought in from the desperate fighting on the Ourcq. He was unconscious. The identification tag had been torn from his wrist. He was dying. No one knew who he was. Then that question close to his ear, "Wouldn't you like some ice cream?" did what doctors had been unable to do—brought him back to consciousness. He couldn't eat the ice cream, but he gave his name, told what regiment he belonged to and how he had been wounded, and whispered a message to his people at home before he died.

When the men get in shape to be moved they are loaded into motor trucks and driven to the club for their cream. Almost any day you can see a row of trucks, borrowed from the army or the Red Cross, rolling up in front of the club rooms on Rue Royale near the Madeleine, out of which climb a bunch of expectant Yanks. Sometimes they have to be helped out and carried up the stairs, while others, with arms in slings or bandaged heads but sound legs, mount the stairs themselves.—From "A Little Chunk of U. S. A.," by Webb Waldron, in Collier's Weekly.

Who'd throw dollars out of the window? Yet many farmers throw manure out of the stable onto a heap where much of its fertilizer value is lost.

Another FEDERAL

A Federal which is earning bigger profits for the Lindell Dairy Co., of St. Louis, Mo.

Save Those Pennies With a Federal

DAIRYING is largely a matter of transportation. Your products must be delivered regularly, quickly and economically. This almost demands the type of service rendered by the Federal Truck, if you want to be sure of the utmost profit at the end of the year.

Many of the leading dairymen have found the Federal superior for their work, because of its unusual stamina, ruggedness and very low operating expense. It stays on the job—every day in the year—giving you the right kind of service—the service that makes for greater profit.

Write us and we will send you the monthly magazine, "Traffic News"—a publication for the truck owner and buyer.

ALFALFA

AMERICAN NORTHERN GROWN

For fifteen years our advice concerning the seeding and care of Alfalfa meadows, and our seed for sowing them, have been standard—the best that was to be had. The catalog tells how, and prices the seed, not Turkestan, "Dwarf Alfalfa," which we refuse to handle, but the best of American grown seed, including usually Montana, Idaho, and the great "Dakota 30," which rivals the Grimm itself.

GRIMM ALFALFA Next to Hansen's Siberian, the greatest variety grown in America. We have the genuine; also limited amounts of the Siberian.

SOY BEANS Whether used for grain, hay, silage, or fertilizer, this crop pleases all who grow it, and is being more extensively grown each year. We have tested hundreds of varieties, besides breeding up some very remarkable sorts of our own, and offer only the best; standard or new ones that can be depended upon.

WING'S GARDEN and FLOWER SEEDS are grown for the most critical trade. Write for free catalog. Lists many new and rare specialties.

Oregon Butter and Cheese Makers Meet

With every section of the state represented, despite the epidemic of influenza, the Ninth Annual Convention of the Oregon Butter and Cheese Makers' Association was the most successful in attendance, number of exhibits of butter and cheese, and enthusiasm of any meeting the association has ever held. The convention was staged at the Hotel Portland, Portland, Oregon, December 11 and 12. There were over one hundred butter and cheese makers in attendance. Thirty-six samples of butter, and twelve samples of cheese were entered in the contest.

The assembly was opened Wednesday morning by President S. O. Rice at which time he appointed several committees to serve during the coming year. The two-day session was replete with splendid addresses and over ninety members remained for the banquet Thursday evening.

At the business meeting the following officers were unanimously elected: President, R. E. Cavett, Portland; vice-president, R. S. Trask, Cottage Grove; secretary-treasurer, P. S. Lucas, Oregon Agricultural College; executive committee: H. V. Franklin and H. C. Raven, Portland, and P. C. Jorgensen of Carlton. A resolution was unanimously passed urging the state legislature to oppose the suggested bi which would abolish the present office of dairy and food commissioner as such, and place it under a public health commission.

The awards in the butter contest went to C. M. Barklow of Norway Creamery, score 94; H. C. Berg of Douglas County Creamery, score 93.75; and S. O. Rice of Mt. Angel Creamery, score 93.5. In the cheese contest Albert Wade of Cloverdale Factory secured first place with a score of 96; H. W. Thomas of Red Clover Factory, second place with a score of 95.5; and Albert Schlappi of South Prairie Factory, third with a score of 95.

Fifth Liberty Loan

There never was a time during the progress of the war when the farmers of the United States as a class did not measure up to the standard of 100 per cent plus Americanism. They gave their boys and their hearts' blood to the cause of humanity and world democracy; they labored early and late and right loyally in raising bumper crops to feed America and her Allies; they bought Liberty bonds to the very limit of their finances, and gave cheerfully and generously to each and every one of the numerous war charities. They proved themselves patriots at "every spot in the road," and, to a man, they stood back of the fighting forces at the front and raised the food that put the final kick in the Yankee punch that finished the Hun.

Moreover, there is no reason to believe other than that the farmer fraternity of the country will as loyally rally to the support of the Fifth Liberty Loan, which is heralded by the Treasury Department as coming next spring. It further is announced that it probably will be of shorter maturity than any of the preceding loans and that the rate of interest will be attractive.

Some of the readers of Hoard's Dairyman, without giving the matter serious consideration, may ask: "Why another Liberty loan when the war is over and we are sending no more troops to France?" The reply to this natural query is best given by a statement recently made by Secretary of the Treasury Carter Glass—almost, by the way, his first official utterance

Sell Your —Milk—

Don't feed valuable milk to your calves. Sell it! You can put your calves through to a healthy, vigorous, early maturity on BLATCHFORD'S Calf Meal at less than half the cost of using milk.

Read What Mr. Rase Says

"Enclosed find pictures of the best twin calves in the state. Their mother died when they were six days old and have been raised by hand ever since, their only food being BLATCHFORD'S Calf Meal. They are ten weeks old, weighing 240 and 235. They are as sound as a dollar."—J. F. RASE, R. R. 11, Box 87, Ft. Wayne, Ind.

Raise Your Calves on

Blatchford's CALF MEAL

Blatchford's Calf Meal has been used successfully by farmers and dairymen in this country for over 38 years. It is the *original* Calf Meal and the *best*.

"We have used BLATCHFORD'S Calf Meal for several years. Noother will fill its place. We can't possibly raise good calves without it."—SANFORD S. PLAYLE, Montezuma, Ia.

Raise Your Calves Easily, Successfully and Profitably

Calf-raising is made easy and profitable by the use of Blatchford's Calf Meal. This is convincingly testified to by the perfectly matured calves that *have been* and are *now being* raised on it by thousands of farmers and dairyman. These people are using it because they have found it a complete milk substitute, easy to feed and more economical than milk.

r taking up the reins of office laid
n by William G. McAdoo:
The initial stages of peace may be
id even more expensive to the
ple of the United States than war,
use several very essential mat-
have yet to be attended to. For
thing we are still at war with
many, although experiencing a
on of peace—the peace of an ar-
ice—and there is no telling what
unt of police work may have to be
. Germany has no stable or guar-
ed form of government, and revo-
n and armed opposition may be
untered by the American army
ccupation at any time.
An army of about 2,000,000 men
nearly half that number belong-
to our sea forces have to be paid,
transported, and then returned
e and demobilized. Enormous
rnment contracts for supplies
ot be repudiated; the goods must
aid for in full. Our great ship-
ling activities, designed to make
t least the second greatest carry-
power in the world, must be car-
out at a cost of hundreds of
ons of dollars, to the ultimate ad-
age of every business man and
er in this great country. Our Al-
if they need money, must have it.
To draw back now and refuse to
d money would be to place our-
s in the position of a business
who, having sunk an enormous
unt of capital and effort in a busi-
enterprise, quits just at the mo-
t when the business is on its feet
is about to pay dividends.
The war is over, but the govern-
t's need for money is not; there-
, the Fifth Liberty Loan. The
eeds from the Fourth Loan are
usted. Uncle Sam never was in
ter need of funds than now. Let's
h the job."

s Calves to Build Up Herd

OARD'S DAIRYMAN:—I like to read
rs published in your paper that
been written by men who have
e a success in dairying, and I very
n get hints in this way that are
h dollars to me in the dairy busi-
In your issue of November 29th,
Barnard discusses starting with
-breds in which he advises pur-
ing mature cows. During the
fifteen years I have purchased
a number of cows and calves,
every time I have found it much
to buy calves. A good dairy-
will keep a sire with a fine pedi-
and will grade up his cows. In
hasing look up the butter records
of this pedigree, then look over
ows and get your calves from the
cows and this sire. In this way
are almost certain to get better
than those which the owner al-
y has in his barn.
nother adv..ntage in buying calves
at you are not so liable to bring
contagious abortion, which is a
ty expensive disease. I would
r have a heifer abort with first
than to have it occur with a ma-
cow as the loss in milk will not
great and the heifer will gain
ze considerable for her second
tion.
would like to see all the dairy pa-
take a firm stand on this abor-
problem in order to get the gov-
ent and the states sufficiently in-
ted to clean up certain districts.
y opinion this may be accom-
ed by selling out the entire herds
have aborted and after six
hs or a year these farms be re-
ed with fine heifer calves.

ng for that territory!

It's a John Deere Plow

FOR many years farmers everywhere have associated the name "John Deere Plow" with special plow quality—with better and longer plow service. Getting this quality is especially important when you buy a tractor plow. A tractor plow does work on a big scale—the quality of the work counts in proportion. A tractor plow must stand heavy strains—its ability to *keep on* doing good work year after year counts strongly in making plow profits. Remember, you get this special quality when you buy a

JOHN DEERE TRACTOR PLOW

Equipped With Genuine John Deere Bottoms—the kind that have an established world-wide reputation for long wear, good scouring and thorough seed-bed making. You can get the shape and type suited to your soil.

Holds To Its Work At Uniform Depth—It is *locked into the ground* at plowing depth through the action of the power lift. And here's another mighty important feature assuring the John Deere's good work—the land wheel is set back, balancing the weight of the plow over all three wheels, just as on your sulky or gang plow. Makes plow run steady and *assures plowing at uniform* depth in uneven ground.

Quick Detachable Shares—Strong and close fitting. Loosen one nut to remove the share. Tighten the same nut and the share is on tight. *It stays tight.*

Extra Strong Construction—Extra heavy beams of special John Deere steel. We guarantee them not to bend or break. Heavy beam braces, long lapped and securely joined to beam with heavy bolts and lock washers.

High and Level Power Lift—Lifting mechanism is simple, strong and positive. Parts move only when plow is being lifted or lowered—practically no wear.

Three Sizes—Two-bottom, three-bottom and *four-bottom.* One of the sizes suits *your* tractor. And, remember, the adjustable hitch adapts the plow for use with any standard tractor.

Farmers Everywhere are making sure of continued good plow service behind their tractor by getting John Deere Tractor Plows. You can't afford to get less than that behind your tractor. WRITE TODAY for full information.

Get Acquainted With the John Deere Full Line

Let us send you free our big 156-page book, "Better Farm Implements and How to Use Them." Full of valuable farming information. A book to which you will often refer. Worth dollars. Tells all about the complete line of John Deere machines listed below:

(Continued from page 844)

quired somewhat of a reputation among some cattlemen because the disease apparently abated materially following their use. But abortion being in a measure a self-limiting disease, the vaccines simply received credit for a result that would have taken place without their use. No responsible person claims that vaccination is not along approved lines of treatment in the handling of contagious and infectious diseases. But the chronic nature of contagious abortion and the low natural immunity following an outbreak indicate that by our present methods we canot hope to establish a satisfactory artificial immunity.

THE USE OF CARBOLIC ACID:—Carbolic acid administered in various ways, such as in the feed, with salt, or injected under the skin, has probably acquired a greater reputation as a drug valuable for the control of contagious abortion than any other agent. The chief reason for this is because, as a rule, no treatment is attempted until the disease has reached its maximum, and in the natural course of events there is a great reduction in the slinking of calves the following year. It is during the height of the disease that the use of carbolic acid is instituted, and it receives credit for the natural decrease in the number of aborted calves. The fact that abortion has increased, in spite of the use of carbolic acid for many years, is an indication that it is not a specific, and is of very questionable value.

THE USE OF METHYLENE BLUE:—This is an anilin dye, claimed to have antiseptic properties, and to have specific action in contagious abortion. It was extensively used a few years ago for this purpose and inquiries are still received regarding it. Its value as agent for the cure or control of contagious abortion was greatly overestimated, and it has almost fallen into disuse for that purpose.

FLUSHING OUT THE FEMALE GENITALS:—By this is meant the washing out of the uterus by introducing various liquids, especially disinfectant washes, which process mechanically removes a large amount of decomposing and putrid material. If properly performed it is undoubtedly of great value, though there are many limitations. For instance, it is recognized that it is impossible to absolutely disinfect such a large infected cavity as the uterus by any means now at our disposal. But we can by applying disinfectants reduce the vitality of all germs, and especially those causing ordinary infection, and thus control the infection so that nature will have an opportunity to effect a cure. Strong disinfectant washes should never be introduced into the uterus, as they have a certain corroding influence. When too strong they do more harm than good. Likewise, weak disinfectants should be immediately withdrawn, because if retained in the uterus they have the same, though slower, corroding effect, and in addition, being poisonous, they may be absorbed from the raw interior of the uterus and produce poisoning.

A general knowledge of the anatomy of the parts is absolutely essential to treatment. The opening into the genitals is spoken of as the vulva, and is succeeded by a large cavity known as the vagina. In the front portion of this is the neck of the uterus. This latter structure varies greatly, depending upon the pregnant or non-pregnant state of the animal, the nearness to parturition, the length of time after parturition, and whether the afterbirth is retained discharged.

There is a popular misconcepti regarding the neck of the cow's ut rus, largely because many live sto men have had occasion at some ti or other to examine this organ in t mare, and believe the anatomy to the same in the two animals. This wrong, for while the neck of the ut rus in the mare is soft, straight, a usually more or less open so that finger may readly be passed throu it, in the cow it is rigid or ha tortuous, and in its normal state i pervious to the finger. These latt facts many times cause a cat owner to believe that his animal barren because she is not "open".

In the pregna state, the neck the uterus is closed and sealed with plug of mucous. In the healthy n pregnant animal it is likewise i pervious, though there is no plug mucous. Immediately preceding a during calving, the "neck" is wid dilated or practically disappears, t it will again contract to its non-pr nant state shortly after the act calving is completed. However, if t afterbirth does not come away t hangs out through the "neck" it w keep the latter open, while, on t other hand, if the afterbirth is tained *entirely within the cavity the uterus, the "neck" will close* a imprison the decomposing afterbir The question of washing out the u rus depends entirely upon the ab ty of the operator to overcome these difficulties. As long as "neck" is open the procedure is a s ple one, becoming increasingly d cult as the "neck" closes, or the aft birth is retained.

Immediately after the abortion uterus may be washed out with fr a few pints to several gallons of lu warm disinfectant solution. amount used varies, as a rule m less being needed when there is little infection and when the abort has taken place at an early period, cause at this time the uterine cavit much smaller than at a later per The general rule is that the wash out is to be continued until the so tion comes away clear.

The following disinfectants may used: (1) A one-half of 1 per c water solution of carbolic acid, w for practical purposes may be m by adding a teaspoonful of carb acid to one quart of water. (2) A one-fourth of 1 per cent water s tion of compound solution of cre being one teaspoonful to one-half lon of water. In some instances, s pecially immediately after calving abortion, even such weak solut cause the animal to strain violen In that case it is probably bette use (for a few days) a salt water lution made by adding salt to t water in the proportion of a sm teaspoonful of salt to a pint of wa

The solution is best introduced means of a piece of soft rubber ing passed through the neck of uterus, and as far forward into uterus as possible, attaching a fu to the free end of the tubing, ele ing the latter three or four feet, permitting the solution to enter gravity. The use of an injec pump is not advisable, as by m of the latter too much force is times exerted, resulting in ruptur the uterus and death of the cow. the uterus becomes filled the solu may be withdrawn simply by lo ing and inverting the end of the and attached funnel, so that it act a siphon. During this process t is a tendency for uterine folds, a birth, and shreds of membranes t drawn into the tube so that the l must be kept free by means of hand inserted into the uterus al side the tube. If the solution ca be so removed, it then becomes n

s y to insert the hand and arm into t animal's rectum, with the palm of t hand downward, and then by s oking the uterus from before back- w rd, the solution may be massaged o .

he number of washings also vary g atly. If the infection is slight, as i icated by little or no discharge, o washing may be sufficient; if t re is much discharge, the washing s uld be repeated daily, gradually re- d ing them as the discharge de- c ases.

n all of this work it is of prime i portance that the strictest cleanli- n s be observed. Under no circum- s nces is it permissible to insert f y hands, or introduce dirty in- s uments into the genitals. Likewise b ore commencing the operation the o side genitals must be cleansed by w shing with soap and water, fol- l ed by an antiseptic such as pre- v usly recommended.

FLUSHING OUT THE MALE ANI- MALS:—The long hairs at the opening o the sheath should be kept clipped a short as possible. An area, having a iameter of about 2 feet immediate- l surrounding the opening of the s ath should be thoroughly scrubbed w h soap and water, followed by a 2 p cent solution of some good hog d or other reliable disinfectant. The i erior of the sheath may be disin- f ted with the same class of agents a previously recommended for flush- i out the uterus of the cow. The s ne form of apparatus may be used f irrigating purposes, i. e., a piece o rubber tubing and funnel, or a hu- n fountain syringe is very ser- v eable. The disinfectant is permit- t to flow into the sheath by gravity u il that organ is distended with the s ution. Outflow is momentarily pre- v ted by grasping the opening of t sheath in one hand, and at the s ne time manipulating the sheath w h the other, so as to cause the dis- i ectant to permeate all parts of the s ucture. By thus alternately filling u and emptying the sheath, and re- p ting the process before and after e h service the spreading of abor- t n by the bull will be practically e minated.

Removal of the Afterbirth

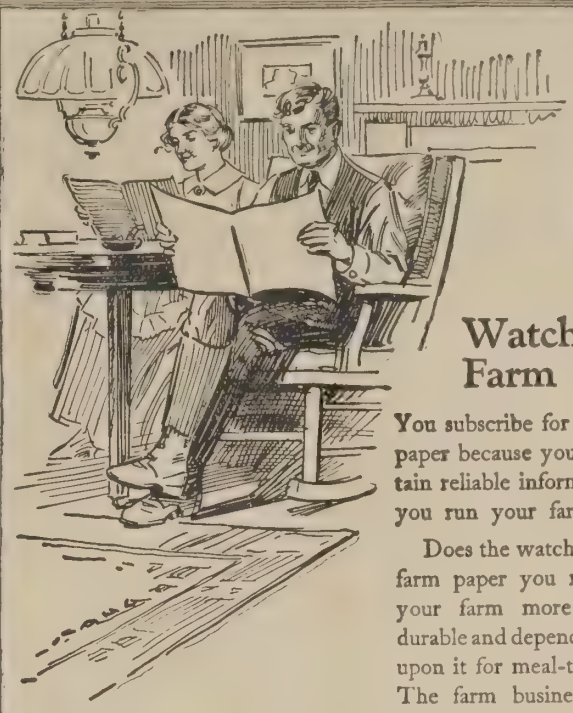
f abortion occurs during an early s ge of pregnancy, the afterbirth is u ually passed out with the young. At a later stage it is almost invariably r ained, and in those herds in which c tagious abortion is present, but in w ich the calves are carried full term, r *tention of the afterbirth is fre- q ently the only symptom. When this f lure to promptly pass the after- b th is observed in several members o a herd, it is almost c nclusive evi- d ce that the disease commonly spok- e of as "contagious abortion" is p sent.*

t is almost a physical impossibili- t to completely and thoroughly re- m ve the retained afterbirth of con- t ious abortion, and many good ani- m ls have been ruined by attempts to d so. In the cow the afterbirth is u ually held tightly in that portion of t uterus closest to the ovaries, and t s is beyond the reach of the longest a ned operator. The result of an at- t pt at removal is that most of the a erbirth, *with the exception of that i the inaccessible part* of the uterus, r emoved, and this remnant, through d omposition, causes a chronic dis- c rge. The diseased condition thus p duced causes a thickening of the w lls of the uterus, and possibly hope- l s barrenness.

n the present state of our knowl- g e the best that can be done with a r ained afterbirth is to keep the out- s e genitals as clean as possible with a iseptic washes, to wash out the va- g a daily with an antiseptic wash so a to remove accumulated decompos- ing material, and to insert into the uterus a gelatin capsule, having a capacity of approximately 1 ounce, filled with iodoform. The capsule will dissolve so that the practically non-irritating though powerfully disinfecting iodoform will be in contact with the afterbirth so as to prevent the formation of bacterial poisons and the resultant septicemia or so-called blood poisoning. Instead of a capsule containing iodoform, a mixture of 1 pint of olive oil and 1 ounce of iodoform may be used, being introduced by means of a funnel and rubber tubing. Cottonseed oil and mineral oil may be used as cheap and efficient substitutes for olive oil. One of the foregoing antiseptics should be used as often as twice a week as long as the afterbirth is retained.

Regarding the afterbirth itself, it is to be pulled on gently by grasping it with the hand in the vagina and as close to the neck of the uterus as possible, and it is to be removed only when it comes away easily. It may be necessary to repeat these manipulations daily for several days; patience and perseverance, combined with the skill of experience, will bring the best results. Under no circumstances should force be used, nor should a portion of the afterbirth be removed, because, as stated heretofore, as soon as the afterbirth no longer hangs through the neck of the uterus the latter will close and imprison the remaining portion so that it cannot be removed, but must be slowly absorbed, leaving the animal's health permanently ruined and her breeding power destroyed.

It is not the idea to convey the impression that ideal results will be obtained from the foregoing treatment. If properly carried out, though it requires severe and exacting labor, it will give better results than any other line of treatment practiced at the present time.



Treatment for Sterility

Sterility or barrenness is a condition in which the cow fails to conceive though bred repeatedly. It is a common sequel of contagious abortion as either the abortion germ or the germs that enter the uterus as a result of retained afterbirth are capable of maintaining the uterus in a serious state of ill health. Other conditions, in addition to infection of the genitals, that are responsible for barrenness are diseased ovaries and occasionally disease of some other part of the female genitals. The handling of these conditions demands an intimate knowledge of anatomy and pathology, and vast experience. The novice, and even the expert, is bound in some cases to be disappointed in the results obtained.

If a cow's afterbirth is promptly discharged or, if retained, the infection that accompanies it is controlled by the methods outlined in the preceding pages, then barrenness from that source will be reduced to a minimum. In this connection it is well to remember that in some cases a portion of the afterbirth is retained, or the infection is so severe that at the end of four to six weeks of treatment no improvement is observed. In such cases the animals should be slaughtered as incurable and as a menace to the remainder of the herd.

There are many erroneous ideas about barrenness, the commonest being that the animal is not open. It is well to repeat what has been stated previously, that in a state of health the neck of the uterus in a cow, contrary to that of the mare, is impervious to the passage of a finger or even an object much smaller than a finger, and an attempt to "open" a cow in order to make her conceive is bound to result in failure or may end

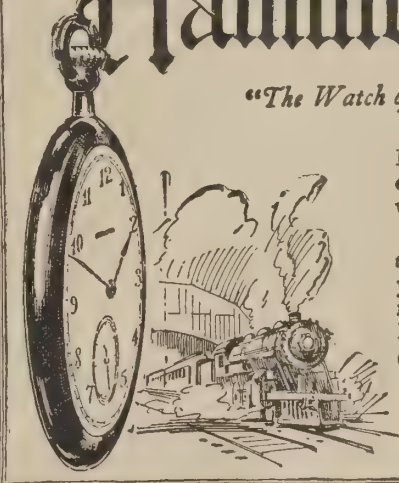
HAMILTON WATCHES



Watches and Farm Papers

You subscribe for your favorite farm paper because you believe it to contain reliable information that will help you run your farm most efficiently.

Does the watch you carry, like the farm paper you read, help you run your farm more efficiently? Is it durable and dependable? Can you rely upon it for meal-time, for train-time? The farm business, like railroading, has become so complicated that it has to be run on a careful schedule.

Hamilton Watch

"The Watch of Railroad Accuracy"

The sturdy dependability of the Hamilton makes it the favorite watch of train-crews, and makes it just the watch for the farm.

Go to your jeweler's today and inspect his Hamiltons. You may choose your Hamilton from a total of 22 models, ranging in price from $32 to $160. Hamilton movements alone $17 ($19.50 in Canada), and up.

Send today for "The Timekeeper"—the story of Hamilton Accuracy

Western Canada's "Horn of Plenty" Offers You Health & Wealth

Western Canada for years has helped to feed the world—the same responsibility of production still rests upon her. While high prices for Grain, Cattle and Sheep are sure to remain, price of land is much below its value.

Land capable of yielding 20 to 45 bushels of wheat to the acre can be had on easy terms at from $15 to $30 per acre—good grazing land at much less.

Many farms paid for from a single year's crop. Raising cattle, sheep and hogs brings equal success. The Government encourages farming and stock raising. Railway and Land Co's. offer unusual inducements to Home Seekers. Farms may be stocked by loans at moderate interest. Western Canada offers low taxation, good markets and shipping; free schools, churches and healthful climate.

For particulars as to reduced railway rates, location of land, illustrated literature, etc., apply to Supt. of Immig., Ottawa, Can., or

George A. Hall, 123 Second St., Milwaukee, Wis.
Canadian Government Agent.

WESTERN CANADA
Farm Lands at Low Prices
The Wheat Belt of America

It Pays to Dehorn

Dehorned cows give more milk; take less room; are gentle and easily handled. Steers fatten quicker and are harmless—they pay better. The new

Improved Keystone Dehorner

removes horns quickly, cleanly and safely. Shear has sliding cut; no bruising. Easy to dehorn. Money-back guarantee. Send for booklet.

Coming Events

Massachusetts Dairymen's Association meets in Horticultural Hall, Boston, Mass., Feb. 10, 1919. Acting Secretary, O. A. Jamison, Amherst, Mass.

Western Dairy Products' Show and Annual Meeting of Western Dairy Instructors' Association will be held at Boise, Idaho, Feb. 10, 11, 12, 1919.

Minnesota State Dairymen's Association hold annual convention at Waseca, January 21-23, 1919. Chris Heen, Secretary, Osakis, Minn.

Illinois State Dairymen's Association at Bloomington, January 21, 22, 23, 1919. George Caven, Secretary, 136 W. Lake St., Chicago.

Wisconsin Buttermakers' Association hold annual convention at Eau Claire, February 4-6th, 1919. Prof. G. H. Benkendorf, Secretary, Madison.

Kentucky Dairy Cattle Club meeting and Dairy Show, Jan. 30, 1919, at State University, Lexington. Secretary, J. J. Hooper, Lexington.

Waste Nothing at Butchering Time

HOARD'S DAIRYMAN:—In butchering various farmers have various ways, each no doubt believing his method best. So it is with myself. Having had many years of experience in the operation I wish to briefly relate some things which may or may not be of interest to other readers of Hoard's Dairyman similarly engaged at this season.

For 24 hours previous to killing I withhold all feed from the hogs. When this is done the entrails are less likely to be ruptured than when full and the work of removing the fat adhering hereto is more conveniently done. When ready to kill I exercise care to avoid all undue excitement. When the animals are quiet at the time of being killed this aids a freer discharge of the blood which, if retained in the flesh, prevents successful curing of the meat and causes it to not keep well during hot weather. Some men knock their hogs in the head with an axe before sticking, others simply stick them and let them bleed to death. The method I prefer is to shoot them with a good 22 calibre rifle before sticking them, being sure that the first ball fired enters the brain. I think we should be humane in killing hogs and do it as quickly as possible to prevent their suffering. When life is extinct the hog is stuck with a knife of medium length with a keen edge, the knife being inserted just forward of the breast bone and close to it. The blade is then turned and thrust full length toward the tail, being quickly turned from right to left to sever the veins of the neck and avoiding a side or shoulder stick or other defective work.

Before killing everything has been made ready, water heated, gambrels and spreading sticks at hand, etc. It is very important to get a good scald so that the hair can be easily and quickly removed by the scrapers. The water is first brought to the boiling point, then a small quantity of wood ashes is put in which helps loosen the hair and removes scurf from the skin. The water is allowed to boil briskly for a few minutes before being used. I am not in favor of guessing at the temperature for scalding. I use a thermometer with which the right temperature can be obtained every time. For large hogs weighing 300 or 400 pounds 170 degrees F. is about right, for smaller ones the water should not be above 150 or 160 degrees and then the hogs should not be kept in the water long. Anyone who has had experience in killing hogs knows that it is better to have the water too cold than too hot, for in the former case it may be remedied by adding hotter water, while in the latter case the hair becomes set and the skin cooked tender so that with ordinary scraping the skin comes off.

I have a scalding tank with two trace chains across it on which the hog is laid. One end of each chain is fastened on one side of the tank and when the carcass is on the chains two men each holding the free end of a chain let the hog down into the water, roll the body about three or four times and then pull it out to air. The process is repeated until the hair "pulls easy". When the hair comes off freely from the legs and ears the scald is sufficient. The carcass is then laid on the platform and the scraping process begun, the legs and head being first cleaned. After the hair is all removed the carcass is hung up by means of a rope and pulley blocks to a firm support previously prepared. The body is washed by drenching it with hot water and all scurf and stray hairs removed by scraping it down with a keen knife. When this is done the carcass is given a dash of cold water and the scraping continued until the hog is thoroughly clean.

To remove the entrails with dispatch and cleanliness requires some skill. With a sharp knife I open up the front of the body taking care not to cut into the intestines. As the entrails are being removed a large tub is ready to receive them. The fat is removed from the entrails while they are yet warm. The heart, liver, lungs, windpipe, and tongue are cut out all together. Then having placed a cob or piece of wood in the mouth to keep the jaws apart and the spread stick half way down the belly to open the sides, plenty of clean, cold water is dashed in until the interior is perfectly clean. The carcass is allowed to hang until cold, but not allowed to freeze. Then it is taken down and cut into sides, shoulders, and hams.

I always dry cure my meat. For every 100 pounds of meat I take 4 pounds of coarse salt, 2 pounds of brown sugar, 1 pound of allspice, 2 ounces of saltpeter which is well powdered, and one ounce of carbonate of soda. These are all mixed well together before being applied. I rub the meat first with about one pound of sorghum molasses for every 100 pounds of meat, then rub with one-half of the preparation until it begins to stick well, which is usually about five minutes. I then stack the meat

A CHAMPION HOLSTEIN JUDGE

Miss Elizabeth R. Cook won highest honors in judging Holsteins in the Students' National Contest at the 1918 National Dairy Show. Miss Cook ranked fifth in the contest which comprised the placing of three classes of each of the four leading dairy breeds and the writing of reasons on two of these classes. She has the further distinction of being the first woman to participate in this contest. She was a member of the Cornell, New York, dairy judging team.

in a large box, first putting in a thin layer of salt at the bottom. A layer of sides is put on this with the rind downward, then all the other cuts are placed on them. After 24 hours I turn and rub again, using one-fourth of the above named mixture, then in 48 hours I repeat the same process, applying the remainder of the preparation. I let the meat remain in the box for six weeks, wash it in water just warm enough to bear my hand in, and then brush each piece with a coarse brush which removes all fat, slime, etc. It is then placed in a tank of clean, cool water and let remain for 24 hours. This takes out the surplus salt. Afterwards I hang the meat up in a dry place where there is a good draft. If the days are fine and dry with a little breeze blowing, the meat is generally sufficiently dry in about a week, when it is smoked.

In smoking the cuts the smoke is conducted to them as cool as possible. The walls of the smoke house are 12 feet high, the meat being hung up close to the top and the cuts placed about six inches apart. From four to five days smoking is given, care being taken not to smoke too much, which greatly affects the flavor of the meat. I use oak wood for smoking. A small fire is started beneath the meat on a large piece of sheet iron. The wood is kept dampened which causes it to produce much smoke and little blaze. I smoke the meat until it is of a light brown color. After being smoked the meat is placed in cheap cotton cloth bags, care being exercised to tie t tightly at the top, and hung from ceiling of the smoke house until weather begins to warm in the sp It is then packed away in perf dry bran.

Some may think I go to unneces trouble in the care and handling o meat and I will admit that I p good deal of work on it, but I the best and I have never eaten that I liked better than the meat on my farm. By treating the me the way above described I can, should wish to do so, keep it for in good condition.

In the care of meat there is point that should not be lost sigh and that is maintaining as fa possible an even temperature. much heat will cause the fat to and turn musty, and if too dan will sweat and decay.

In refining the lard we use a iron kettle set over a slow fir small amount of water is poured the kettle, the vessel then being to the brim with fat which has cut in small pieces and washe free it from blood and other im ties. A lid is placed over the kett prevent the entrance of fo matter and the fat kept simmerin several hours. The cooking mus be hurriedly done. From time to the fat is stirred and the cooking tinued until the contents ceas bubble and become clear. There is water in the kettle as long as the tents show a cloudy or milky ap ance. To refine a large kettle of thoroughly, from six to eight constant cooking is required. Whe liquid becomes clear the kettle moved from the fire and the con allowed to cool. The cracklens dipped from the kettle, the then being pressed out of them a lard press. The lard is str through small wire sieves which vent any of the fine particles getting into the lard cans whic purchased at the stores. These are those used by packing house have, of course, previously held

The trimmings of the meat, tog with the head, feet, liver, and kid are used in making sausage, souse, and head cheese, all of are sold to people in town except which is preserved for future u our home.

Illinois. A. O. CHOA

Offer Reconstruction Cours Agriculture

Agricultural reconstruction lems are to be given careful con ation in a special eight weeks' c at the Ohio College of Agricultu ginning January 6 and ending F ary 28. The subjects taught w live stock management, soil fer farm crops, dairying, fruit gr and gardening, poultry raising, management, and farm mech While this course is in charge o same faculty members as the year course, it is distinctly diff and especially prepared for the farmer who wants to get the word in agricultural informatio as related to current conditions.

In commenting recently on th visability of enrolling in su course, Major W. S. Pealer o State Draft Headquarters said personally from my knowledge agricultural conditions existin Ohio would urge every agricu worker to avail himself of the o tunity offered by such a course. country must prepare for the justment and reorganization th going to follow a signing of peac one of the problems is going that of agricultural production. scarcity of labor must of necess made up by the increased efficie those engaged in such work."

ying in Three Forks, Mont.

Sunflowers as a Feed

OARD'S DAIRYMAN:—The geo- hical head of the longest river in h world is about three miles from h town of Three Forks, Montana. e the three rivers, Gallatin, Madi- o and Jefferson, unite to form the ouri, which from this point to the of Mexico is 4,200 miles long. town of Three Forks is thus situ- near the apex of a vast fan- ed body of land drained by the e rivers named, and whose valleys ain more fertile, arable land than er one of several of the states in Union.

e Gallatin Valley has been for 's noted as one of the most fertile s in the world, producing enor- s crops of wheat, oats, peas, bar- clover, timothy, and alfalfa. Po- es and all garden vegetables suit- to this latitude also grow abund- y. What is true of the Gallatin ey is also true of the valleys of Madison and Jefferson rivers. The ison Valley, having no railroad er than Three Forks, is not agri- urally developed like the others. Jefferson Valley, although the st settled portion of the state its tributaries are included), has cultural possibilities not yet med of by its inhabitants. But it f the possibilities of the country nd Three Forks for dairying that ostly wish to write. In the first e, it has unsurpassed transporta- facilities, the main line of the ago, Milwaukee, & St. Paul Rail- , and the Butte line of the North- Pacific running through the town. re is an empire of land lying just t to irrigate and oceans of water which to irrigate it. Alfalfa and t other kinds of forage and pas- grasses grow here to perfection. ithin the last three years the tana State College at Bozeman been conducting an extensive line experiments with sunflowers, both silage and fed green (chopped) gratifying results. By irriga- a crop of 24 tons, and in some s more, has been produced to the . Careful and exhaustive experi- ts at the state college have dem- rated that, pound for pound, sun- er silage is the equal of corn si- . When it is considered that near- wice as much of sunflower silage be raised here as of corn silage in consin or Iowa on an acre of land, that with irrigation sunflowers a surer crop than corn in the t, one can readily see that with our ge crops and abundance of good er and the cool nights here in sum- , that this part of Montana is des- d to become a dairy center of im- ance.

hree Forks has the honor of build- the first silo in the world for the usive purpose of ensiling sunflow- Many will be built next year and into operation. I know (for I e talked with many of the farmers think there is nothing but corn silage) that the idea of putting flowers into a silo will appear ri- lous. But let the scoffers remem- that not many years ago the silo corn was not popular and some ners, even in Wisconsin now, are osed to them. But the silo has e into pretty general use just the e.

GEO. H. WEBSTER,
Ass't. State Dairy Commissioner.

ick Spreading Saves 70 Per Cent of Manure

With manure worth $8 a ton, it is ntial that the whole amount be erved by hauling it right from barn to the field which is to go in- orn next spring," says Emil Truog he Soils Department of the Uni- ity of Wisconsin.

This statement is not true for the specialized farmer who has rough or hilly land from which the manure will wash off before planting time. On the hilly farm the manure should be carefully saved under sheds or manure pits and then used next spring on acres sown to corn. It has been estimated that at least one-third the value per ton of manure is lost by improper care, such as dumping the fertilizer outside and allowing it to remain there and leach over winter.

"The specialized farmer, such as the truck gardener, can probably make the best use of the manure by composting it. The well rotted manure of the compost pile will suppy best the requirements of the garden in the spring."

Ensiled Oats, Barley, and Wheat Straw

HOARD'S DAIRYMAN:—In the November 15th issue of Hoard's Dairyman I saw an inquiry from R. K. E. I am a herdsman at the experiment station here. A stave silo was built this season. The intention was to fill it with oat, pea, and vetch mixture. Owing to the wet, cold season, peas and vetches did not grow. It was decided by the manager to fill the silo with anything in the shape of grain. The oat crop was cut between showers and was shocked and remained about 15 days before filling started. Barley was cut past milk stage. Spring wheat, frozen in milk, was also cut into ½ inch lengths. Water from hose was turned on every few minutes, then shut off until more was cut. Interned German aliens from a camp nearby were put tramping in the silo. When nearly three-quarters of silo were filled, it was seen that there was not enough to fill silo, so a stack of threshed fall wheat straw, along with a few loads of rye (unthreshed), was cut near top.

When straw was being cut, I kept hose running pretty steady (¾ inch hose) and started to feed four weeks after filling was completed. About 8 inches were moldy but from there down it was fine. It was a rich brown in color and smelled very much like good corn silage.

The cows in milk failed about an average of 1 pound a milking when first fed, but seemed to relish it. I fed about 25 pounds to each cow once a day in evening. Calves, yearlings, and stock bull all are eating it fine. The only difference in handling it from corn silage is that if you do not use it every day, instead of getting moldy and unfit for food, it dries out and is much the same as cut, dry straw, the difference being in the color.

From our experience with this trial, never again will I be afraid to ensile anything that cattle eat in the way of grain, grass, or corn crops. I think R. K. E. may safely try it as we are highly pleased with the feed. I forgot to state after all the unthreshed rye was cut, there remained about 3 feet to fill. It was filled with threshed wheat straw alone, and was, as stated, relished by all stock at first feeding; not one since has refused to clean up.

I find Hoard's Dairyman better than when I first took it over 20 years ago. I may say it was largely through reading and putting into practice its teachings that I developed a fondness for dairying. I followed its precepts so closely in my first dairy that a gentleman visiting my barn and seeing the system carried out said to me, "Say, young fellow, you must be reading Hoard's Dairyman". I left the dairy some years ago and did not see a copy of it again until taking my present position. I subscribed for it again. It is the light on top of the bushel to dairymen.

Ontario. E. D. BERTRAND.

You'll OKay This Feed For Best Results

Some feeds lose money for you, others just about put you even, but the feed that will make you the most money all the time is

Happy Cow Feed

There is no doubt about the quality of this feed. You will Okay it, even before you feed it, and you'll do it on its composition.

Happy Cow Feed is composed of cottonseed meal, corn meal, wheat bran, alfalfa meal, cocoanut meal, velvet bean feed, unhulled peanut oil feed, rice bran and polish, and ½ of 1% salt.

These high grade materials are scientifically combined to give the best results in milk production, and they do. A trial will prove its great value to you.

Get this complete dairy ration from your dealer. If he cannot supply you and won't, write to us for sample and price.

In This Sign You Conquer

THIS is the sign of the LAUSON Dealer. Wherever you see it you have only to step in and look at the pattern of the Tractor Industry. You have only to ask him and he'll arrange a demonstration on your ground.

You can have one of the children come out and run it if you like. Undoubtedly, in hundreds of places in America today 14 year old boys are running LAUSON Tractors as well and easily as any man.

That is because it is not only hard for a LAUSON to get out of order; it is hard even to put a LAUSON out of order.

So in this sign you conquer, completely, the problem of Power on your farm.

The Lauson

For All Power Work on the Farm

You do all your field work rapidly and steadily and when that is done you do your belt work, your pumping, threshing, dragging or silo filling with equal ease. You can handle three times the acreage with the same power and one-third the trouble.

Write for the LAUSON Book on Power Farming. It is FREE.

There is no other tractor like the LAUSON. The tractor experts have called it "The Pattern of the Industry" and we are proud of the name they have given it.

The LAUSON Tractor has back of it our 23 years of experience and reputation as builders of the famous Frost King and Lauson high grade engines.

The John Lauson Mfg. Company, 538 Monroe St., New Holstein, Wis.

EDITORIAL COMMENT

In one of the Milwaukee high schools attempt is being made to determine the effects milk will have upon children who do not receive it in their homes. Quite a large percentage of children who come to the schools of that city are never given any milk, but instead are given strong coffee three times a day. It is to such children that milk is being given and their physical and mental improvement observed. Last winter one of the Milwaukee schools obtained milk for some of its children and a decided improvement was noted in the physical and mental conditions of the children.

ARE YOUR COWS COMFORTABLE?

The making of milk is the function of motherhood. The cow gives up much energy every day when she produces 20, 30, 40, or 50 lbs. of milk. This is a drain upon her system. Therefore she requires different attention than is given a steer. A steer gives up nothing until he is killed. As he proceeds to fatten, he provides himself with a blanket, so to speak, and does not mind cold or even lying in the snowbank when he is filled with corn or other feed, but not so with the dairy cow. In the first place she does not carry as much flesh and, also, the energy she gives up in producing milk is a drain on her body. Moreover, she is a mother once a year, and this draws upon her strength.

The cow should not only receive an adequate amount of feed but care should be taken, especially when it is cold, to give her a little extra carbohydrates. We consider it a good plan to feed a pound or two more of corn meal per cow per day when the weather is zero or below. Further, care should be taken to prevent the cows from being in drafts, but they should have an adequate supply of pure, fresh air; for air, in a measure, is a food. It is the substance that renews the blood. It is the little attentions given to a herd of cows, such as caring for their comforts, providing them with plenty of water and feed, keeping them warm and out of drafts, that provide for the largest and most profitable flows of milk.

ADVANCING THE CLOCK

The farmer works by the sun and not by the clock. Advancing the clock one hour last summer to save daylight did not meet his approval and many refused to advance their clocks. This was not stubbornness, for a farmer must adjust his work to the sun. The clock is incidental.

The cows come up from the pasture in the early evening. The horses know when it is noon. It is the sun that tells them the hour of day. Advancing the clock one hour has more disadvantages for the farmer than advantages. In the spring it forces him to do his chores in the morning by the lantern. At the time of haying, harvesting, and threshing, the dew is not gone by seven o'clock by the sun and it is eight by the clock; the dew governs the work in the morning. At night it is six by the clock and five by the sun. If the farmer follows the clock he quits, and in many cases he is forced to, because the hired help insists upon attending entertainments in the city, and the city is governed by the clock.

There was one advantage this past summer by advancing the clock one hour. It gave the business men an opportunity to go to the country after the stores had closed and give the farmers a boost with their work. Advancing the clock one hour as a war measure was undoubtedly of advantage to our industries as a whole, but in times of peace it would not be approved by the farmers.

BUTTER WANTED

It has been reported to us from several sources that oleomargarine is not enjoying the large sales anticipated by its manufacturers. The spread in price between butter and oleomargarine is larger than it has ever been, yet people are using good butter.

The Chicago Dairy Produce mentions editorially a dealer who handles both butter and oleomargarine. This dealer said that although there was a difference of 42c in the price of extra butter and the best so-called substitutes, the consumers pay the price for butter. In previous years, a difference of 8 or 10c was sufficient to turn a large part of the trade to cheaper products. This dealer reasoned from his own experience. He had gone into one of the poorest appearing retail groceries in Chicago, patronized by common laborers, to collect for butter delivered from his store. He asked the proprietor about the butter trade and the prices he was getting and was told the trade was very good for fine butter. The retailer had plenty of money, paid his bill, and increased his order. When asked about the demand for so-called substitutes, the retailer said it was poor.

People want good butter and they will buy it when they can pay for it and they have the money now. This is the crux of the whole matter in a nutshell. Oleomargarine does not satisfy the taste. We may grow concerned over so-called substitutes, but dairy farmers and manufacturers of butter hold the situation very largely in their own hands. Produce a high grade, even quality of butter and the consumer will buy it if his pocketbook will permit.

WAR BROUGHT MILK

Much has been written regarding the consumption of milk in the various countries and its importance to the welfare of the nations, especially in Europe. It may surprise our readers to know that Great Britain has adopted drastic measures to provide milk for her babies, according to J. C. Welliver in the National Geographical Magazine. "If an adult patron of a public eating house," he says, "buys and drinks a glass of milk as a beverage, he is liable to a fine of $25 and the proprietor subjects himself to a like penalty. The result is that the death rate among infants under five years old has been about half the rate in pre-war times. For the first time in the modern history of Great Britain there is milk enough for all the babies, and good milk."

In some of the European countries there has been a high mortality among babies because of the lack of milk, but it took the great war to teach the people of Great Britain the necessity and importance of good milk for babies. It is not a high compliment to Great Britain that her babies should not have had a sufficient amount of milk before the war, but the lesson learned through the war can never be forgotten.

The world war cost millions of lives and billions of dollars, but it has emphatically impressed upon the minds of all people the importance and food value of milk, and who knows but that this great war, horrible as it has been, might not be the means of saving millions of lives.

FARM AND CITY WAGES

In discussing editorially the question of the disparity between farm and city wages, the Chicago Tribune draws attention to a very important phase of the question that is more often overlooked than understood. It says:

"It is not proper to introduce sentimentalism into an economic subject; yet there is something of the artist in the average farmer, for he inevitably will neglect the economy of his labor that he may devote the full measure of his skill and energy to the art of agriculture. He perceives at the cost of infinite pains that he is creating life all about him and that upon him rests the responsibility of conserving that life to the point of a fruitful harvest. The mechanic lays down his tools at intervals scientifically calculated best to insure his physical, moral, and mental fitness. But a crop of wheat does not wait upon a neatly adjusted social survey. There is in the growing field the urge of creation. The farmer feels this and so devotes his energy without stint."

To this we would add that the farmer is not only moved by the artist's desire to create, but he plants and cultivates with high hope that Providence will be kind and bless his labor with abundant harvests. He is spurred on to untiring effort by his faith in the season's bounty and with the hope that the market will properly recompense his efforts. His is not an assured wage, but to a degree it is the gambler's wage, with all the intoxication and spur of winning that is the enticement of that profession. He knows he is assured of a living, for he can produce his necessities, and so he stakes his labor against the seasons and the markets. Properly interpreted it is sublimated gambling grounded on the sound desire to create life and make things grow.

Turning from the discussion of the farmer, the Tribune speaks of necessity of knowing the costs of production that distribution may be properly controlled and directed after the farmer is assured of his proper wage. It then gives the following excellent statement of the city man's responsibi

"It is doubtful if any citizens have found th steps of readjustment more congenial thar farmer; for the first time his prices have somewhere near the proper relation to co production. Of course this has had its effect cities, where high prices have been universal sented. But we have been compelled to poir that persons may not live in the cities enjoyi the advantages of consuming without contrib a just proportion of their gains in return fc immunity they enjoy from the labor of produ We must not expect to enjoy comfortable and the luxury of palatable victuals deliver our doors without adequate compensation."

LET US BE MORE THAN TH AVERAGE

When a man speaks of the farmers of a st nation he speaks of a very wide diversity of Although all are engaged in tilling the soi from it raise the productions upon which th pend for revenue, yet the resemblance stops The men themselves are very dissimilar. We if any other class can show such a wide diffe in character, ability, intelligence, and the which comes to their hands. The great stimu purpose with every man, whether he is a fa merchant, or mechanic, should be to rise abo average of his class. The farmer, in parti should be filled with the ambition to show the that he is something more than an average fa He should strive to keep better cows, shee hogs than his neighbors; show a better syst farm management, better crops, etc.

Such a man will make larger profits an larger respect from all classes. Too many ha ambition to own a large number of acres, th that will bring them larger respect and which, however, is not true.

It is a splendid ambition, which leads a mar a fine, skillful farmer. One cannot help adi such ability when it is shown in the neat, we house and grounds, the spacious, well painted and outbuildings, good fences, well bred fan mals, and a thorough system of farm manag

Such men are true artists; they have the a sense and ability to construct a fine farm p Their neighbors can learn something from every day. There is an unconscious tuition goes out from their lives and example.

Such farmers are a blessing to their comm and their state. "May their tribe increase." much finer and larger in every sense is it young man to have the ambition to be such a er than to enter the over crowded professions towns are full of men who have been a s there. Many such a man has spoken to us b of the folly of his youth in leaving the farm. ern agriculture, with its machinery, improv stock, its books, experiment station reports, schools, colleges, and strong intellectual fo work on every problem, is a different thing that of 50 years ago.

A young man of education and ability ca on the modern farm, opportunity for all the power, all the skill and energy he can muste rewards in money, health, comfort, and tru pendence of character, as well as the resp his fellows, are greater here than in the to is a larger field, full of the fascinating myste animal and vegetable life.

Wise is the young man who says early i "I propose to make of myself a first class f I will take all the advantages that wide r and study can bring me. I will show my and my skill in the appearance and outcome farm. I will establish a neat, tasty farm hon will show the passerby that a man of taste telligence lives here. My farm shall be my p well as my profit."

Such a man will make a grand, good citi well as farmer.

Qualifications of a Cow Tester

What are the qualifications for a cow t Does he have to have special training in th of work? Where can he obtain such traini there much of a demand for cow testers, an pay do they usually receive? Tell me someth the nature of their work.

Pupico, Mo. SUBSCR

The cow tester has much to do with the su ful working of an association. He should b fitted temperamentally and should have had training for the work. Punctuality, regu and accuracy are of great importance, for he has these qualities the records may not be

ion of the value of the respective cows. The e should also have the ability to advise and he farmers, and for this reason it is neces- iat he be constituted temperamentally to vice in such a manner that it will be accept- followed. The position of cow testers offers nt opportunities for dairy students to gain al experience and is the best kind of school hem for responsible positions in connection iairy work.

ning for the position of a cow tester may be ed at the various state agricultural colleges o at some of the county agricultural schools. ntly a man who has had dairy experience ows how to figure correctly and to operate bcock test is enabled, through a little coach- the supervisor in charge of cow testing as- ons, to take a position as tester and give a ccount of himself.

tester is expected to accurately weigh and the milk of each cow and then make a test of it. He also keeps a record of the t of feed given to each cow and then makes record for the entire herd from this compu- He has his books to keep, in which all this ation is entered and the profit over cost of shown. He spends one day at each farm present at the time the milk is weighed, both g and evening. There is at present a very emand for testers and the salaries paid will from $50 to $75 a month, the tester re- his board and lodging while at each farm. he farmers may either transport the tester some cases, they allow him extra compensa- ien he provides his own conveyance.

her information as to the opportunities and ments for cow testers in Missouri may be l by writing A. C. Ragsdale, College of Agri-, Columbia, Missou.i.

g Feeds to Buy Bran and Oil Meal

ly balance me ration for milk cows of the ng feeds: I have on hand oats, barley, ear ood silage, clover hay, and good corn stover. always favored mixing in bran which I can se at $36 per ton and oil meal at $60. I ike to know which of the home-grown feeds sell to best advantage to get the bran and l as I have plenty of all home-grown feed on Oats are selling at slightly over 2 cents per barley at a trifle less than 2 cents, and corn ts.

tkinson, Wis. H. J. Y.

ay be said that oats is a little more valuable ed than bran, and corn a little more valu- an barley, but there is not enough difference feeding of these grains to be really measur- Whether it would pay you to sell the oats, is worth $40 a ton, and buy bran at $36 a a question which our inquirer must decide. se, it will cost something to grind the oats will cost something to exchange the oats for n. Just how much, can be determined by the of time required to bring a ton of oats to nd take back a ton of bran and the cost of g a ton of oats.

at 1¾c a pound is a little cheaper than bar- 2c a pound. This being true and there is a of these two feeds, it would undoubtedly be sell the barley and feed the corn, although l not be out of place to feed some of each.

ould suggest that each cow weighing 1,000 fed about 30 lbs. of silage daily. Some will tle more, others a little less. We would also ch one all the clover hay she would care to e. A very good mixture to supplement the nd the clover hay would be 200 lbs. ground 200 lbs. ground corn, 200 lbs. bran, 100 s, and 100 lbs. oil meal. This mixture pro- number of feeds and it is well to have sev- ds in a mixture. We would feed about 1 lb. mixture for each 3½ to 4 lbs. of average milk produced, that is, testing about 3.8%. not convenient to feed the mixture we have d, then it may be made of 400 lbs. of either barley or corn, 300 lbs. bran or oats, and of oil meal. As we stated, we like a variety in the mixture and would prefer the first if it is convenient to make it.

Naming Cattle

give me a system for naming cattle.
n, Ia. P. S.

ly to the above question we herewith pub- system of naming cattle as followed by W. t, a prominent and successful Wisconsin

gard to my system of naming cattle I have h aims to convey all the breeding possible with the shortest possible name. I will take two instances to illustrate; one Johanna and the other Colantha.

"We will suppose that these cows both have heifer calves, these calves would be named in the numerals, viz: Johanna 2nd and Colantha 2nd, and so on with all their heifers. If Johanna should drop a bull sired, say, by a son of Colantha, it would be named Sir Johanna Colantha or Duke or King, any short name as a prefix. On the contrary, if the sire and dam of a calf of this breeding were reversed the Johanna-Colantha would be reversed, always giving the name of the dam first, and the combination name second to indicate the blood of the sire.

"Now, then, we have, say, Johanna 2nd and Colantha 2nd and will suppose that Johanna 2nd drops a heifer calf from a Colantha bull; we would name that calf Johanna Colantha. On the other hand, if Colantha 2nd should drop a heifer sired by a Johanna bull we would call it Colantha Johanna. Now, either of these calves dropping heifers would be named in the numerals same as Johanna and Colantha originally. When we have a name either single or in combination without any numeral attached, we simply name the female offspring in the numerals, but animals named in the numerals and carrying a combination name like Johanna Colantha 2nd, etc., we drop the second combination name Colantha and supply a name that comes with the sire so long as we can, but if not, try to select a name beginning with the same letter so the animals will have but two names. For instance, the first daughter of Johanna Colantha 2nd was sired by Sir Fayne Concordia, hence the daughter coming from this cross was named Johanna Concordia. The second daughter by this same bull would have been named Johanna Fayne but having used this name in one of our other similar crosses we gave the second daughter the name of Johanna Colonia. I have dropped the plan of giving possessive case in my naming like Colantha 4th's Johanna as I like to indicate all I can in the naming and have it as short as possible.

"Our bull calves we give the same system when we can but frequently submit this to the purchaser who usually will want all the name he can get, like Johanna Colantha Champion, or Johanna DeColantha Champion, or Johanna DePauline 2nd Colantha Champion. I think I have made this plain and need say no more."

Recipe for Corned Beef

I wish to butcher a yearling steer and corn a part of the meat for future use. Can you help me to a recipe for corning beef?

Whitehall, Mont. C. M. H.

The following recipe for corning beef is taken from Farmers' Bulletin 183:

"The pieces commonly used for corning are the plate, rump, cross ribs, and brisket, or in other words the cheaper cuts of meat. The loin, ribs, and other fancy cuts are often used fresh, and since there is more or less waste of nutrients in corning, this is well. The pieces for corning should be cut into convenient sized joints, say, 5 or 6 inches square. It should be the aim to cut all about the same thickness so that they will make an even layer in the barrel.

"Meat from fat animals makes choicer corned beef than that from poor animals. When the meat is thoroughly cooled it should be corned as soon as possible, as any decay in the meat is likely to spoil the brine during the corning process. Under no circumstances should the meat be brined while it is frozen. Weigh out the meat and allow 8 pounds of salt to each 100 lbs.; sprinkle a layer of salt one-quarter of an inch in depth over the bottom of the barrel; pack in as closely as possible the cuts of meat, making a layer 5 or 6 inches in thickness; then put on a layer of salt, following that with another layer of meat; repeat until the meat and salt have all been packed into the barrel, care being used to reserve salt enough for a good layer over the top. After the package has stood over night add, for every 100 lbs. of meat, 4 lbs. of sugar, 2 ounces of baking soda, and 4 ounces of saltpeter dissolved in a gallon of tepid water. Three gallons more of water should be sufficient to cover this quantity. In case more or less than 100 lbs. of meat is to be corned, make the brine in the proportion given. A loose board cover, weighted down with a heavy stone or piece of iron, should be put on the meat to keep all of it under the brine. In case any should project, rust would start and the brine would spoil in a short time.

"It is not necessary to boil the brine except in warm weather. If the meat has been corned during the winter and must be kept into the summer season, it would be well to watch the brine closely during the spring, as it is more likely to spoil at that time than at any other season. If the brine appears to be ropy or does not drip freely from the finger when immersed and lifted, it should be turned off and new brine added, after carefully washing the meat. The sugar or molasses in the brine has a tendency to ferment, and, unless the brine is kept in a cool place, there is sometimes trouble from this source. The meat should be kept in the brine twenty-eight to forty days to secure thorough corning."

Paying for Milk at Condenseries

We have recently installed a condensing outfit in connection with our creamery and are anxious to get some information as to how the prices of milk are fixed; in other words, to get on a standard basis of buying our milk just as other condenseries in the West and East are doing. Can you give us this information so that we can get on the same basis that we are now working on in buying our butterfat?

Selma, Alabama. R. W. B.

There is no one standard that condenseries use in paying for milk, this being largely adjusted according to local conditions and the various competitive markets. In the West and along the Pacific Coast it is the general custom to pay for the milk according to its butterfat content, and in most cases making additional allowances for the value of the skimmilk. In the Middle West and in the East the condenseries are now paying the same price and upon the same basis as the market milk distributors are paying for their milk. Condenseries in the territory tributary to Chicago and beyond are paying the same price or a slightly lower price than is received by farmers delivering milk to the Chicago distributors.

At the present time this price is based upon the Pearson formula as interpreted by Judge Lamb. The price for December is $3.76 per hundred pounds for milk delivered at the country receiving plant. The required test is 3.5 per cent and allowances of four cents per point are paid for higher tests; that is, if milk tests four per cent the producer should receive $3.96 per hundred pounds.

In certain sections of Wisconsin condenseries are paying on the basis of four per cent test. One recent case has come to our attention where the condensery at Menomonie, Wisconsin, is paying $4.00 per hundred for four per cent milk during the current month. We are not advised as to what deduction or addition is made for lower or higher test, but assume it is based upon a three cent to six cent per point basis.

In the New York market milk section prices are fixed upon a three per cent fat basis, and three to six cents per point fat is allowed for higher tests.

We would also call attention to the reports of prices received for dairy products as given in the weekly reports from cow testing associations. The several methods now in vogue will be noted.

How to Feed Rutabagas

In one of your issues I notice what you had to say about feeding rutabagas to milk.. cows, and I will be glad to have you advise me if these are to be fed whole or run through a food chopper, and if they are chopped is it done freshly before each feeding, or can you chop at one time enough for a day's feed.

I would also like for you to advise me how often a cow giving around three gallons of milk a day should be fed, and what proportion of her daily feed should be given at each meal.

Greenville, S. C. J. A. S.

Rutabagas should be run through a feed chopper before feeding them. It is quite customary to cut them fresh every day and it is wholly feasible to cut enough at one time for the day's supply.

It is quite customary to feed cows three times a day. Some people feed five times a day. It does not matter so much how many times a day a cow is fed, provided she is fed regularly and given enough to eat of good, wholesome, palatable feeds. Grain and silage or roots are fed in the morning and at night. At noon an allowance of hay is given. It is the practice of some dairymen to give their cows some dry roughage after they have consumed the succulence and grain both at night and morning.

Value of Whey for Feed

Please inform me the value of whey for feed.

Iron Ridge, Wis. F. S.

Whey is worth about one-half as much for feeding live stock as skimmilk. One hundred pounds of skimmilk are worth about one-half bushel of corn. This would make 100 lbs. of whey equivalent to 1 peck of corn in feeding value.

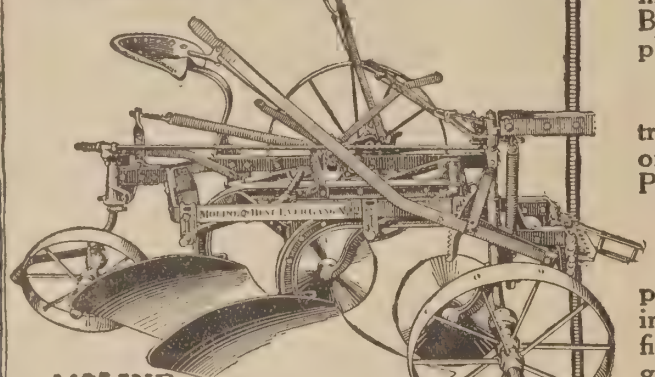
MOLINE PLOWS

For Tractor or Horse Use

IF you need a walking, sulky, gang or tractor plow, buy a Moline and you will never regret it. They are backed by 54 years' plow building experience.

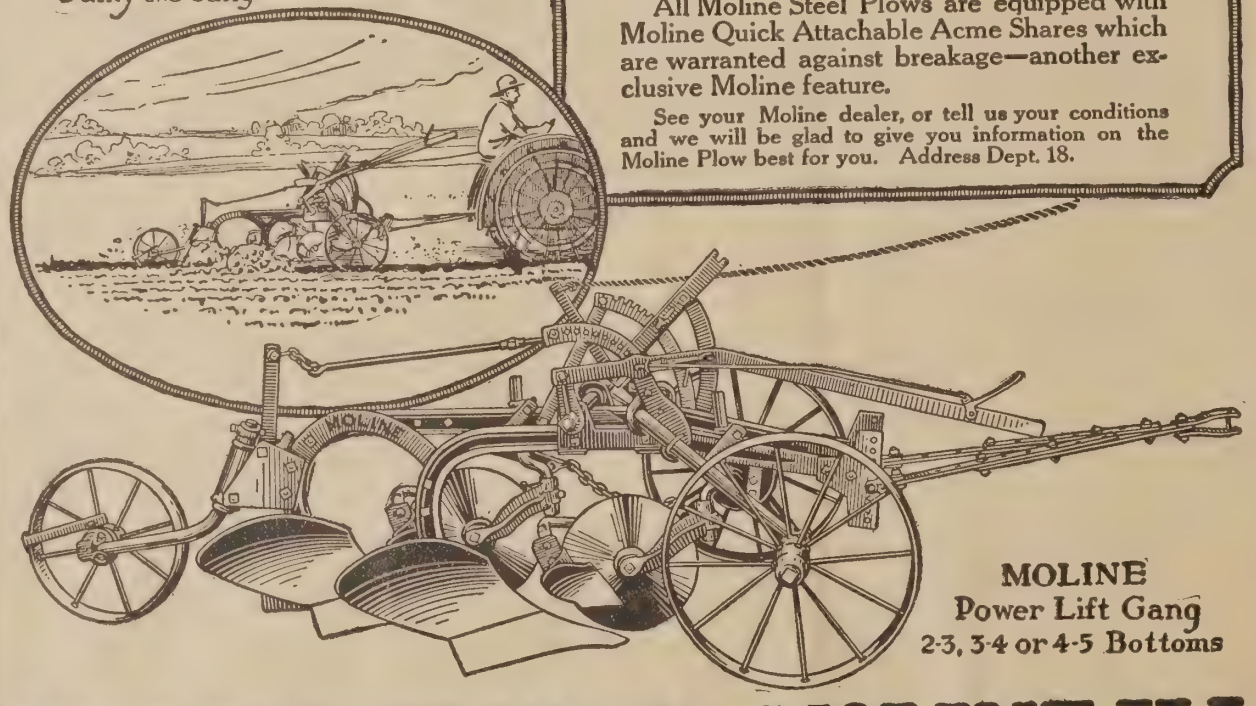
The Moline Best Ever Sulky and Gang have long been famous for good work, ease of handling and light draft.

W. V. Clark of Winterset, Ia., says: "My Best Ever Gang runs easily one horse lighter than my other gang." "My four horses handle my Best Ever Gang easier than they did the sulky plow I had," says W. C. Moore of Martel, Neb.



* * *

The Moline Power Lift Gang is the ideal tractor plow for work behind any size or style of tractor. A tractor owner with a Moline Power Lift Gang will never have occasion to find fault with the work of his outfit. It is equipped with a positive power lift. By simply pulling a cord you can raise the plows, full depth out of the ground, or any intermediate distance to vary the load in difficult conditions to prevent stalling of the engine. This is only one of several equally useful features you get with Moline Power Lift Gang.



* * *

All Moline Steel Plows are equipped with Moline Quick Attachable Acme Shares which are warranted against breakage—another exclusive Moline feature.

See your Moline dealer, or tell us your conditions and we will be glad to give you information on the Moline Plow best for you. Address Dept. 18.

MANUFACTURERS OF QUALITY FARM IMPLEMENTS SINCE 1865

A Holstein Story

Holstein breeders will be interested in the following enthusiastic and humorous article prepared for his local paper by Mr. J. H. Lewis of Wisconsin:

"John W. Beran has been elected to membership in the National Holstein-Friesian Association, the headquarters of which are located at Brattleboro, Vermont. This in itself is nothing to get excited about; you cough up fifty bones, but before the Association accepts your spondulix, you have to qualify. And qualification here has a regular University course backed clear off the boards. After scanning the records we arrive at the just conclusion that Mr. Beran is a scientific stock raiser. There is first a record in which is kept a complete biography of Miss Holstein from the day she is born down to even date. She is christened of course and, as in the Beran case, you pick all the prettiest names first. If you suspect about now that a woman has had a hand in the business you have guessed correctly. And such names as Lucretia, Regina, Alice, and Gwendolyn appear on the register.

"The question arises when Beran applies for membership, is his particular bunch of pets, pure-bred? The expert at Brattleboro reads over the record, obtains at first hand comparative data backed by testimonials from several governors of states, a few United States senators and some poor and respectable breeders of blood royal Holsteins, such as the Morgans, Goulds, and Rockefellers, and decides that John W.'s herd is genuine blue bloods. His money is accepted and he is elected to membership.

"Talk about aristocracy—Ward's New York 400 are cheap cross bred mongrels compared to the spotless purity of these queens of the Holland ruling house.

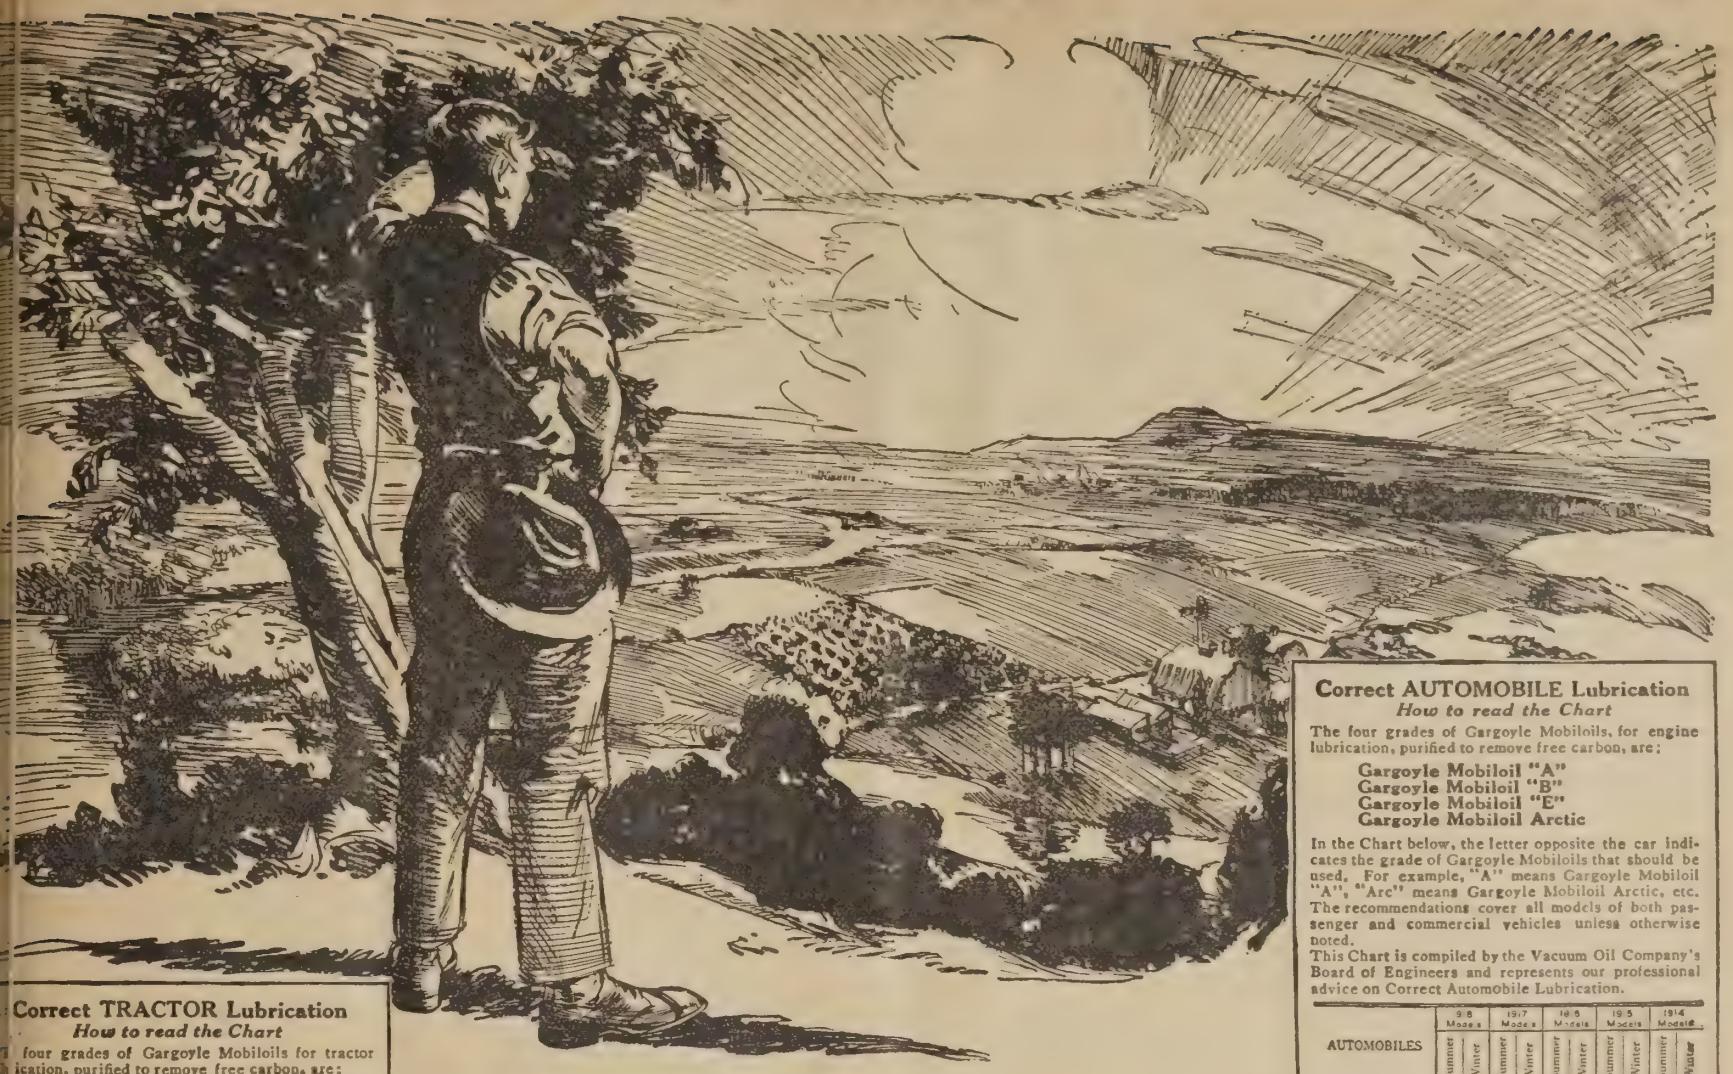
"And a pure-bred Holstein as a butterfat producer, considering investment and return, is a closed corporation with the stockholders drawing down anywhere from 100 to 1,000 per cent dividends annually. As a side issue, the owner of the herd comes along now and then and cruelly separates Baby Holstein from Mamma Holstein at the rate of $100 per baby, and sometimes a whole lot more. The longer the record and the purer the strain, the deeper the Holstein lover digs into his wallet. The more lovers the baby has the more certain are the rivals for her heart and foot to bid up the ransom demanded.

"It's a great business, this of raising a Holstein family. Aside from the wealth begetting faculties involved are the enticing charms of cow and record. A clean, well kept, pure-bred Holstein is a doll and you can't help falling in love. Many cases are reported of love at first sight. We have been proud of our family records usually kept on the front page of the Bible, but for a Holstein record you must produce something vastly more comprehensive than names and dates. The measured proportions of Mr. and Mrs. Holstein occupy a whole page each drawn down to the most exacting fraction of the first unit of measurement and the markings are shown both sides, with unfailing accuracy."

Self Sucking Cows

On this subject G. C. D. of Wausa, Nebraska, writes: "I saw the inquiry of T. T. A., of Jacksonville, for a means of preventing a cow from sucking herself, so I thought I would tell you of a way my father used on one of his cows. A piece of wood or iron is bent into the form of a horse collar, so shaped as to bring the ends nearly together. This was placed over the cow's neck just in front of the shoulders, with the open side down. Half way down on either side of this collar the end of a short rod was attached, the other end being securely fastened to rings in her halter. When she attempts to turn her head to suck, these rods stop her."

A Massachusetts subscriber gives his method, as follows: "Put a head halter on cow, also a surcingle just back of front legs, not very tight, in fact mine is quite loose. Fasten a ordinary harness snap on one end of a stick about five feet long; a fork handle is about right size. When you turn the cow out, put stick between front legs and through surcingle snapping into ring in halter. She can eat, drink, and do anything necessary except to lick or suck herself. When she lies down, the stick prevents her from sucking herself. Take it off when she is in the barn."



A. A. of Chardon, Ohio, writes: "My method of preventing a cow from sucking herself is to place a sack over her udder. It costs but very little and is the most satisfactory method. A surcingle is placed around her body just back of her forelegs, a strap runs from this to and around the tail, the whole being similar to the usual back pad, back strap, and crupper of a harness. Two half-inch straps are attached to the back strap just in front of the hips so as to cross diagonally, one end of each strap extending over the hips to the rear of the udder and the other straight down to the front quarter on the opposite side. A piece of canvas or grain sack is cut to proper size to cover the udder, each corner of which is attached to the ends of the half-inch straps by means of a ring and snap. The half-inch straps should have a buckle at the top, so they may be conveniently tightened up."

Leslie Myers of Kansas states his experience as follows: "If the reader will put a straight bit bridle on the cow it will not harm her, as my cow was able to eat and didn't seem to mind it. The bit prevents the cow from lapping her tongue around the teat. Usually one or two months will be sufficient to break her."

F. A. C. of Winfield, Kans., suggests the following for a self-sucking cow: "Fasten a common pointed bridle bit in her mouth by means of a halter headstall. Let her wear this continually. Adjust it so it will not make her mouth sore. Have tried it and it works."

Jersey Cattle Notes

For week ending December 27th: Number of animals registered: Bulls, 125; cows, 361; total, 4... Number of transfers recorded: Bulls, 139; cows, 371; total, 510.

The Years Ahead

OLD farm methods are being thrown aside. The tremendous margin between what the farmer *has* produced and *can* produce—what he *has* earned and what he *can* earn—becomes every day more evident.

He realizes at last the vital part he plays in the welfare of his nation—and the other workers of the country are looking to him with a new respect.

For war has shown the people the true importance of a man who produces Food.

The farmer who has formed the habit of looking ahead, plans every year for a marked increase in his crops. He realizes that the productive possibilities of his soil have not been touched.

A sixteen year old boy has recently raised 169 bushels of corn on one acre. Illinois, our best corn state, averages per acre 29 bushels.

Recent experiments in Indiana, by scientific cultivation and fertilization of wheat, brought an increase of over 40% over the average crop.

Cases like these are becoming more common every day.

The two chief factors in the increase of yield per acre are proper fertilization and proper farm machinery. The one type of farm machinery that is doing the most to increase production per acre is the tractor.

Think of it! Not many years from now millions of horses and mules now on the farms will be replaced by tractors.

Fewer men will cultivate more land. Arm labor, leg labor and back labor will be taken over more and more by machinery.

The farmer will be a business executive. He will work more with his mind and less with his body. He will have more time for recreation. His will be one of the most interesting, independent and worthwhile ways in which men earn their living.

* * *

TO the Vacuum Oil Company it is a matter of great satisfaction that, almost without exception, the leading tractor manufacturers consider Gargoyle Mobiloils first choice among the tractor lubricating oils.

Gargoyle Mobiloils are put up in 1- and 5-gallon sealed cans, in 15-, 30- and 55 gallon steel drums, and in wood half-barrels and barrels.

Write for "Correct Lubrication" booklet containing complete automobile and tractor chart, and other valuable data.

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloils from your dealer, it is safer to purchase in original packages. Look for the red Gargoyle on the container

VACUUM OIL COMPANY, New York, U. S. A.

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world

Domestic Branches: New York, Boston, Philadelphia, Pittsburgh, Detroit, Chicago, Minneapolis, Indianapolis, Kansas City, Kan., Des Moines

Correct TRACTOR Lubrication

How to read the Chart

The four grades of Gargoyle Mobiloils for tractor lubrication, purified to remove free carbon, are:

Gargoyle Mobiloil "A"
Gargoyle Mobiloil "B"
Gargoyle Mobiloil "BB"
Gargoyle Mobiloil Arctic

The Chart below, the letter opposite the tractor indicates the grade of Gargoyle Mobiloils that should be used.

Correct AUTOMOBILE Lubrication

How to read the Chart

The four grades of Gargoyle Mobiloils, for engine lubrication, purified to remove free carbon, are:

Gargoyle Mobiloil "A"
Gargoyle Mobiloil "B"
Gargoyle Mobiloil "E"
Gargoyle Mobiloil Arctic

In the Chart below, the letter opposite the car indicates the grade of Gargoyle Mobiloils that should be used. For example, "A" means Gargoyle Mobiloil "A", "Arc" means Gargoyle Mobiloil Arctic, etc. The recommendations cover all models of both passenger and commercial vehicles unless otherwise noted.

This Chart is compiled by the Vacuum Oil Company's Board of Engineers and represents our professional advice on Correct Automobile Lubrication.

DELCO-LIGHT
Blazed the Way

Delco-Light has carried the conveniences and labor-saving efficiency of the city to the farm districts.

It has proved that electric light and power on the farm multiplies man-power and saves both time and labor.

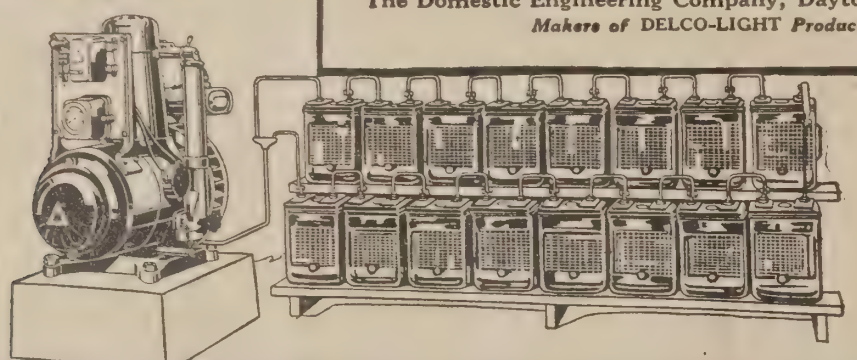
Delco-Light is accomplishing these results today on more than 60,000 farms.

It is a good investment because it actually pays for itself.

Delco-Light is a Complete Electric Light and Power Plant;—

It furnishes power to operate the fanning mill, grind-stone or washing machine—to milk the cows, operate the cream separator or tumble the churn—to pump fresh running water to all parts of the house and barn.

It supplies bright, clean, safe electric light—makes it easy to do chore work after dark without the bother and danger of old-fashioned lamps and lanterns, thus reducing the fire hazard.



Delco-Light runs on *Kerosene*. The same coal oil or Kerosene formerly used in lamps and lanterns now furnishes both light and power.

Thousands of testimonial letters prove these things in actual experience of Delco-Light Users

The Domestic Engineering Company, Dayton, Ohio, U.S.A.
Makers of* DELCO-LIGHT *Products

A Complete Electric Light and Power Plant for Farms and Suburban Homes—Self-Cranking—Air Cooled—Ball-Bearings—No Belts—Thick Plate Long Lived Battery.

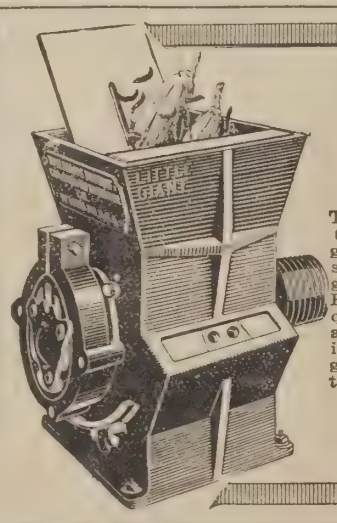
RUNS ON KEROSENE

More Light Than 20 Oil Lanterns

AT LAST—the light of lights! A lantern that lights with common matches just like the old style oil lantern, but makes and burns its own gas from common gasoline, giving a brilliant, steady, white light of 300 candle power.

Most Brilliant Light Made

Brighter than the brightest electric bulb. More light than 20 oil lanterns. Cheapest and best light made. Costs less than one-third of a cent per hour. Safer than the safest oil lantern. The



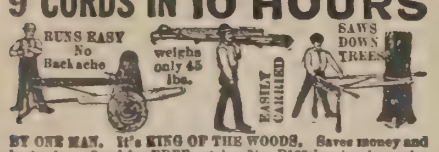
Coleman Quick-Lite

No wicks to trim—No globes to wash. No dirt or grease, no glare or flicker. Absolutely safe. Fuel can't spill—no danger if tipped over. Guaranteed Five Years—will last a lifetime.

If your dealer can't supply, address our nearest office for Catalog No. 9

The Coleman Lamp Co.
Wichita, Dallas, St. Paul, Chicago, Toledo.

Grind Your Feed
With the Wil'iams Patent LITTLE GIANT GRINDER



The Little Giant Grinder will grind your Ear Corn (husk, cob and all), your Oats, Wheat, or any other grain, into either a fine, medium or coarse meal as desired. It will not merely crack these grains but will grind them into a real meal.
Equipped with genuine SKF ball bearings power requirements are reduced to the minimum. Four sizes give a wide range of capacity. Hundreds of farmers are using this machine, therefore, if you are anxious to save grain and reduce feeding costs investigate and install this machine. Bulletin No. 699 explains in detail.

CANADIAN RANCH FOR SALE

One of the finest wheat and stock ranches in Alberta for sale. Contains 800 acres—250 in cultivation. Elaborately improved; good water. If you want a farm and home that will pay for itself in one year, see this. Priced for quick sale at $35 per acre. Terms—for photos and all information, write owner.
BOX 13, - BIG VALLEY, ALTA.

Control of Abortion Disease

[Continued from page 855]

in the death of the animal. Likewis breeding powders and similar prepa rations or concoctions administere by way of the mouth, injected into th genitals, or given in any other manne will not overcome the diseased condi tion of the genitals, which is largel responsible for the barrenness. I case of valuable animals, consult graduate veterinarian experience in this work. Let him make an exam ination and render an accurate diag nosis upon which intelligent treat ment may be based.

It should be understood that n hard and fast rule for handling abor tion disease can be laid down. Eac herd is a study in itself and treat ment must vary with the condition *A man who will not follow a definit plan of herd improvement need ex pect no help, for no help can be give* There is no easy way of getting ri of this disease. Its suppression is de pendent upon a realization on the par of the owner of the principles under lying disease, and the thoroughnes with which he carries out the detail of sanitation.—Circular 69, Kansa College of Agriculture.

The Creamful Cow

Kansas has reached the climax o her prosperity as a grower of porter house steaks. The manufacture of th porterhouse steak ensconced in th Hereford steer from now on will b a hazardous business. For it require a weather-worshipping, cloud-gazing large acreage farmer with a bi capital and lots of credit and exper sive experience to make it go. Tha kind of a farmer lives about four t a section, and a crop failure puts hi on the ragged edge.

The dairy farmer requires a sma farm, a big barn, and a silo, and h snaps his fingers at the clouds. A weather looks alike to him; no cro failure can affect his business; h needs little capital; for every day i the year is an income-bearing day he makes his capital as he goes. H township settles up; he can only far an eighty and he has lots of neigh bors. So the boys and girls stay on th farm and country schools fill up wit children. For manufacturing butte and cheese pays better than manu facturing porterhouse steaks. Th Hereford requires three acres fo grazing; the Holstein is a closer fee er.

In dairying communities bank de posits run up into high figures pe capita, and the deposits are farme depositors—lots of farmer depositor In the meat-growing business a fe farmers have the big deposits an many take the losses. Wheat growin doesn't pay at the present price o land and labor. And a town that help farmers get into the dairying bus ness creates a steady market fo high-grade merchandise. So Emporia in lending the energies of the Cham ber of Commerce to the dairyin interest, is trying to improve th economic status of all Lyon Count If the country grows rich the tow also will grow with the country. Th Chamber of Commerce is taking hol of the most practical manufacturin enterprise it ever promoted. For brings high-grade people to the com munity, who stay generation afte generation, and always are prospe ous.—W. A. WHITE, in Program o Kansas Dairy Tour.

Farmers should remember tha birds are friends of agriculture. A few crumbs thrown out when th heavy snows come may be bread cas upon the waters which will retur next summer in crops saved from in sect pests.

Used in the Best Dairies—on the Finest Pedigreed Cows

When many a country's best known dairies, whose owners keep the highest class and most valuable stock, thoroughly investigate the mechanical milker question and then put their O. K. on the Hinman by installing it, it means that the Hinman ***must be correct in principle, a profit to the owner and a comfort to the cows.***

A man with a herd of high priced cows wouldn't take a chance on a milker about which there was any question. The fact that the Hinman is used on so many fine, pedigreed and registered cows is a ***guide to you*** in the purchase of a milking machine. You are doing the ***safe*** and ***sure*** thing when you buy the milker that is the most favored of all by dairymen in general, as proved by the number of machines sold and in use.

HINMAN MILKER

Big and little dairies install the Hinman to save a lot of time and to solve the help problem. Later they find that there are many other advantages. For instance they find that cows that were hard milkers and others that were restless and nervous when milked by hand, were milked *more easily* and were *more contented* and *comfortable* after the use for a week or two of the Hinman!

They found that the help liked the Hinman method far better than the hand method. Naturally, it was a great deal easier—did away with all the drudgery. Help prefer to work in a dairy that is Hinman equipped!

They found in many cases that the milk flow *improved, increased* with the use of Hinman Milkers. And the milk was *cleaner—showed a better bacterial test.*

They found that their simple Hinman equipment paid in actual extra profits enough to cover its entire cost within a year!

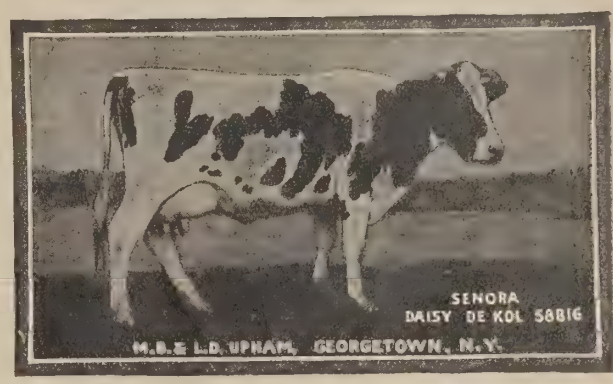
You are offered all these advantages. The cost is *low* compared to all that you get. Merely to be relieved of that back-breaking work of hand milking is enough to justify installing the Hinman! Think of it—no more sitting on a hard stool, crowding up under a cow, perspiring, chasing away the flies!

The machine does all the milking for you—and does it better, more uniformly.

Don't be without Hinman Milkers. It isn't like tying up money for mere pleasure. *You get back all you spend in a very short time* and then it's that much extra profit right along!

New, Big Catalog Free

Send for the new Hinman Catalog. It covers the subject of milking machines thoroughly. It is *interesting* and *enlightening* and it is full of impressive illustrations. A postal will bring a copy to you free.



Lowest Cost

Because the Hinman is simple—has no stationary pump, vacuum tank, vacuum gauge, relief valve, pipe line, and pulsator—its cost is about half that of other milkers.

Evansville, Wisconsin.

IOWA DAIRY HERDS

Holsteins, Jerseys, Guernseys, Ayrshires, Brown Swiss, Milking Shorthorns

We have on file in our office the following information on practically all of the dairy herds of Iowa.

Owner's name, location, shipping facilities, blood families represented in herd, sires in use at this time, records of cows in herd, records of cows not in herd but with offspring in herd, number in herd with age and sex.

This information has been compiled for the use of buyer in order to conserve their time and expense, and to serve the dairy breeders of Iowa. It can be examined in our office or mail inquiries will be promptly answered.

There Is No Charge Whatever For This Service.

GREATER IOWA ASSOCIATION, Davenport, Iowa.

A 1919 Proposition

30-Lb. Ready for Service 30-Lb.

Dam: A 30.36-lb. 4-year-old daughter of Colantha Johanna Champion with his nice list of 30—35-lb. daughters.

Sire: A 35-son of Sir Pietertje Ormsby Mercedes with his great World's record producers.

He is about one-half white and when you see his pedigree you'll want to breed him on the best daughters of your old bull.

His pedigree is waiting for you. *"Home of the Johannas."*

W. J. GILLETT & SONS, - ROSENDALE, WISCONSIN.

HOLSTEINS

Holstein cows, heifers of all ages. If we haven't what you want will help locate. Three weeks old high grade Holstein heifer calves at $20 each. We are in a position to handle any limited sized order. We guarantee high grade satisfaction and safe arrival. Pure-bred bull calves by 30-lb. sires or better at $40.00. We also have a few service aged bulls, at $150 and up.

YOHN'S STOCK FARM, Watertown, Wis.

JERSEYS

FOR SALE

Six choice young bulls, nearly ready for service; eight yearling heifers and heifer calves. All from R. of M. dams.

Glenwood Farms, Mrs. Josiah Letchworth, Prop.
Address: Thos. Rose, Mgr., Essenore, Cayuga Co., N. Y.

Biblical Butter

Butter wherever it occurs in the Bible is chemah, signifying curdled milk. In Deut. XXXII, 15, we find, among the blessings which Jeshurum had enjoyed, milk of kine contrasted with milk of sheep. Butter was much in use among the Hebrews and was prepared as is done today by the Arabs and Syrians, but it was not used by the Greeks and Romans except for medicinal purposes.

The Arabs of Hejaz put milk in a large copper pan over a slow fire and a little sour milk or portion of the dried entrails of a lamb is thrown in. Milk then separates and is put in a goat skin bag, which is tied to one of the tent poles and constantly moved back and forth two hours. The buttery substance then coagulates, the water is pressed out, and the butter put into another skin. In two days the butter is again placed over the fire with the addition of a portion of burgoul (wheat boiled with leaves and dried in the sun) and allowed to boil for some time, during which it is carefully skimmed. It is then found that the bourgoul has precipitated all foreign substances and that the butter remains quite clear at the top. This is the process used by the Bedouins, and is also employed by the settled people of Syria and Arabia. The chief difference is that, in making butter and cheese, the townspeople employ the milk of cows and buffaloes, whereas the Bedouins, who do not keep these animals, use that of sheep and goats. The butter is generally white, of the color and consistency of lard, and is not much relished by English travelers. It is eaten with bread in large quantities by those who can afford it, being taken in a mass with a morsel of bread and not spread as with us.

The butter of the Hebrews might have been sometimes clarified and preserved in skins and jars as at the present day in Asia, and, when poured out, resembles rich oil (Job XX, 17). It acquires a rancid taste that is liked by the natives. All Arab food considered well prepared swims in butter and large quantities are eaten independently of other food.

Butter and honey were used together and were esteemed among the richest productions of the land (Isa. VII, 15) and Arabs use cream or new butter mixed with honey as a principal delicacy.

Strike in New York

HOARD'S DAIRYMAN:—On Tuesday, December 31st, it became necessary for the Dairymen's League to call off the milk from the dealers commencing the first day of January, as the New York Conference Board of Milk Dealers refuses to pay the price set by the League. The League asks $4.01 according to the Warren formula, and the dealers practically offer $3.60, both at 150 miles from the city. There is a surplus of milk now and the dealers are reported to be out for the finish of the League. There are a good many independent dealers who have contracts for some months ahead at League prices who will continue to take milk as agreed. Today there are many uncertainties, but it looks like a serious situation. It seems to be deliberate on the part of the dealers.

The milk investigation still goes on in the city. It is said that the League officers, while exempt under the state law, are supposed to violate the federal Sherman law, and arrests are possible if we may believe some of the city prosecuting officers. The dealers claim to have so maneuvered as to avoid arrest, and this may be possible. Many believe that the city officials are in collusion with the dealers, and they and the city press are almost certainly against dairymen, and likely against the League as an organization. We are told that the trouble of October, 1916, will soon be considered as a mere skirmish. All sorts of stories are, of course, afloat now on the eve of the trouble.

New York. H. H. LYON.

DAIRY MARKETS

CHICAGO, Jan. 2—Butter—Creamery, extras, 66½c; standards, 64c; dairy, firsts, 61½@66c; seconds, 58@60½c.

Eggs—Ordinary, 59@60c; firsts, 63½c.

Cheese—Twins, 35@35½c; Young Americas, 36@37c.

MILWAUKEE, Jan. 2—Butter—Creamery, tubs, 66½@67c; prints, 68@68½c; extra firsts, 64@65c; firsts, 61@63c; dairy, fancy, 45@50c; poor, 20@30c.

Delaware College, Newark, Delaware.

Contagious Abortion

Don't sell the aborters. Clean out the infection. Breeding animals are worth more than ever before. Control of Abortion is doubly necessary.

The Abortion infection causes Barrenness, Retention of Afterbirth and Calf Scours in addition to Abortion. Unless checked it is likely to run through your entire herd.

B-K is a powerful non-poisonous antiseptic—scientifically correct for this work. Used as a douche, it dissolves the slimy albuminous matter in the vagina and uterus, kills the germs, stops discharges and controls the infection. B-K is much more effective than lysol, carbolic acid, Lugol's solution, bichloride of mercury and coal tar disinfectants, all of which tend to coagulate or thicken the albumins.

Contagious Abortion is being successfully controlled in many herds by following our simple plan with B-K. Send for "evidence."

FREE BULLETINS: Send for our valuable bulletin No. 52 on "Contagious Abortion," also "145 Farm Uses" and our "Trial Offer." If your dealer does not have B-K send us his name.

A Word from the Publishers of Hoard's Dairyman

FORT ATKINSON, WISCONSIN

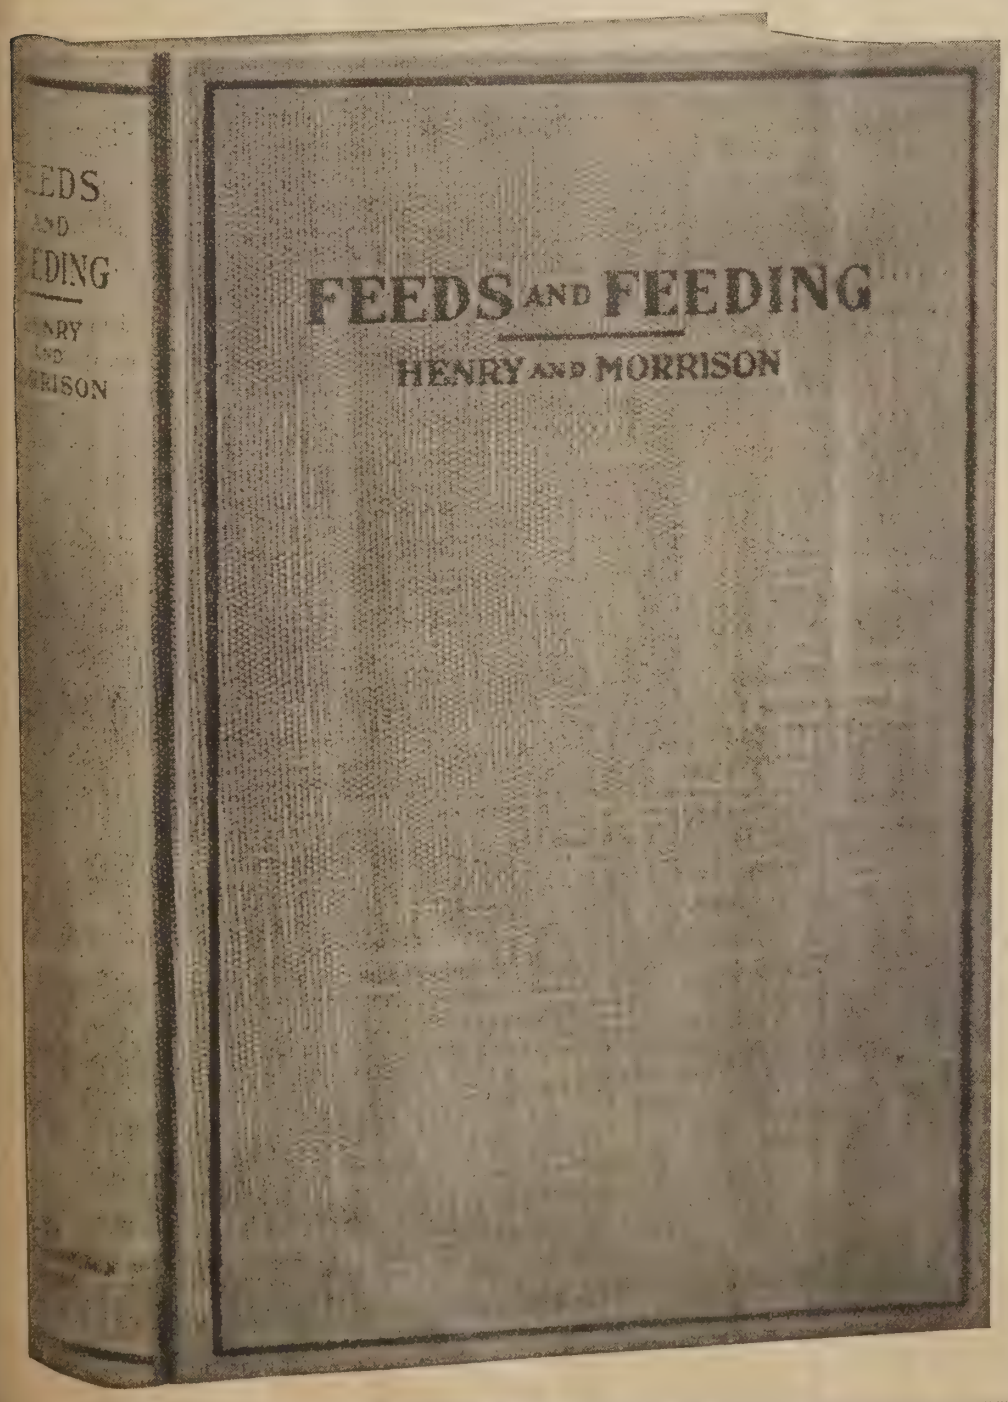
We wish it might be possible to persuade every reader of our paper to "take us up" on the offer we are making. Not alone for the extra subscriptions it would bring us—welcome as they would be! But, because we feel that every one of our readers ought—this winter—to have a copy of Henry and Morrison's wonderful book "Feeds and Feeding".

How About You, Mr. Reader?

Your milk, butter, poultry, hogs, beef—everything you sell—is today bringing a good price. You are **taking in** more money than you ever did. But are you "getting ahead" any faster? Or are you paying it right out in feed bills?

Are you **sure** you are feeding your cows the very cheapest and best ration that will keep up their milk flow and keep them healthy and thrifty?

Are you **sure** you are feeding your other stock (hogs, horses, etc.) as economically as possible?



Don't guess! Not this winter!

If there ever was or ever will be a time when it would pay you in dollars and cents to look into the whys and wherefores of the feeding business—to find out what science and practical experience have discovered about the feeding of dairy cows, hogs, horses, etc.—that time is **now!**

"Feeds and Feeding" is a 691-page volume. It represents the life work of many men. It was first written and published by W. A. Henry, formerly Dean of the Wisconsin College of Agriculture. He devoted the best of his years to gathering, testing and putting into usable form all that men have ever learned about the feeds for, and the feeding of domestic animals. And the best of it all, is that the book is perfectly indexed. Within a few minutes time—and no trouble at all—you can find out **all** about any problem in feeding.

In times like these, the wealth of information this book contains, and the fact that anyone who reads the English language can understand and use that information, makes Henry and Morrison's "Feeds and Feeding" almost priceless.

Get a copy—**now**—of "Feeds and Feeding". Plan to spend a few minutes during each of these long winter evenings studying it. "Square up" **your** feeding practices with what you learn. And we'll promise you that the "high cost of feeds" will be less of a "bug-a-boo" to you than it is now!

OUR OFFER

The price of this book is $2.50. You can't **buy** a copy anywhere for less than that. But we will send you a copy—without any charge, and postage paid—if you will do us a little favor that will take very little of your time. **Send us just four yearly subscriptions to HOARD'S DAIRYMAN at $1.00 each.** They may be either new or renewal subscriptions—and your own renewal may be included in the club. But, your own renewal does not count unless accompanied by three others.

Here's a real chance to put this encyclopedia of feeding on your reading table—without cost—and at the same time to give a few of your neighbors a "lift" along the road to bigger dairy profits!

USE THIS COUPON

Or—if you don't like to cut up your copy of HOARD'S DAIRYMAN—write about the same thing in a letter—

HOARD'S DAIRYMAN,
Fort Atkinson, Wis.

Enclosed is remittance of $4.00. Send me a copy of the latest edition of "Feeds and Feeding".

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Bob in the Calf Contest Club

"HELLO, Mr. Anderson! Hello, Joe! I am so glad you both came over. I've wanted you to see Betsy since the first day she was born."

"Well, Bob, I just happened to be driving past Mr. Peter's place and thought that I would stop in to see Joe's calf, and after that Joe suggested that we both come over to see your wonderful Betsey we are all hearing so much about. I'll tell you, Bob, Joe has a mighty fine calf, Mary Jane Spot, as he calls her."

"She's a prize winner, isn't she, Mr. Anderson?"

"I'm glad to hear that, Joe. It's going to make Betsey and me work just so much harder to beat you in this calf contest. If you fellows want to see the Blue Ribbon calf of our next contest just look into that pen. Come, Betsey, show these gentlemen that you are the queen that will carry the honors next fall."

Upon hearing her name, Betsey came sniffing her way among the other calves. When she caught sight of the strangers she stopped and stood staring at them. "Guess she's a little afraid of you, Mr. Anderson, but she'll soon get acquainted. You see she's a little shy around strangers, especially men. She doesn't see them very often because I take care of these calves. Dad just looks in here once in a while to see that everything is going all right. I often think that calves are like children,—afraid of strangers until they find they will not get hurt by them."

"See, Bob, she likes me."

"Oh, that is because you are a boy, Joe, and she has learned that boys are good to her. I never struck Betsey yet, Mr. Anderson; never even cuffed her ears when I was teaching her to drink out of a pail. You know some fellows just lose their patience with calves at those times and they abuse them. I'll admit that Betsey gave me a little trouble at first. But I just took plenty of time and was patient with her, and I finally won out. Oh, you needn't look at me that way, you rascal. You know that is so. Now she drinks so fast that it seems that it goes down in one swallow. Sometimes I think she'll ruin her digestion. If I ate as fast as that, Dad would send me away from the table."

"How long did you let her suck the cow, Bob?"

"Only once, Joe. I think that is the best way. They are harder to teach to drink out of a pail when they run with the cow very long. Then, too, some calves get too much milk at the start when they run with the cow and that might cause scouring. Scouring is quite common among young calves. It weakens them and sets them back a great deal. It may even cause death if it gets very bad. I don't mean white scours, Joe. That is a worse disease. Common scours is just ordinary diarrhoea and a common cause is overfeeding with milk. Betsey's mother is a heavy milker. Last year she gave 18,000 pounds of milk. I thought if Betsey ran with her she might get too much milk and I didn't want to take any chances."

"I let her get good and hungry before I started to teach her to drink. After I took her away from her mother she didn't get anything for about sixteen hours. You just bet she was hungry when I went into the pen with some of her mother's milk. Of course, she didn't know enough to put her head into the pail and drink. That's what I had to teach her."

"This is the way it was done. I moistened my fingers with some of the milk and then allowed her to suck them. Just when she was pumping good and hard I slowly lowered my hand into the pail. Gee, how she did blow that milk around! You see, she shoved her nose clear down into the pail. She got a few swallows though. Then I did the same thing over and first I knew she kept her head down to the milk alone. I let her get quite hungry for the first few days and I think that helped a good deal."

"I think my way is better, Bob."

"What's that, Joe?"

"I said I think my way is better."

"Well, how do you do it?"

"Oh, I just back them up into a corner and with the pail of milk held between my legs, I push their heads into the pail and hold them there. Of course some of them are pretty stubborn and don't get much milk the first few times. They kind a act as if they are choking."

"Shame on you, Joe! That's the trouble with your method. And you call them stubborn! The poor little things don't know how to drink; they just know what sucking is. Drinking is what you've got to teach them and I don't think scaring them half to death is a good plan. It isn't humane either. Patience and kindness work wonders with calves. They soon learn what you want them to do. Here, Betsey, you stop licking my coat. You are getting too saucy and I may have to punish you yet."

"How much milk are you feeding her each day, Bob?" I asked.

"Well, to begin with I'm going to tell you that I never overfeed these calves. If anything, I'd rather underfeed a little with milk. Overfeeding is very liable to cause indigestion and this brings on scours. My method is this: For about every eight pounds of live weight, I feed one pound of milk. Betsey gets about eleven pounds a day because she is a pretty husky calf. She weighed eighty-five pounds the day she was born. That little white cuss with the two black ears weighed only seventy pounds so she gets about nine pounds. Yep, I weigh out each feed on that spring balance hanging over there. Guess Betsey will soon want a little more than that, she is growing so fast now. Won't you, Betsey?"

"Well, if that rule is correct, Mary Jane Spot has been getting too much milk. I'm sure she isn't as heavy as Betsey, is she Mr. Anderson?"

"Maybe that's why she had the scours last week, Joe," I answered.

"You bet that is the reason," came from Bob. "It's useless, Joe, to feed more than she can digest, and besides it's not economical either. Gee whiz! Dad would give me fits if I didn't weigh out each feed. The price of milk is too high to waste it. Of course, if you are feeding three times a day instead of two, a little more milk can be fed, because you won't overload the stomach so much at any one time. You must remember, Joe, that the judges are going to take into consideration the cost of feeding these calves."

"Where did you get that rule, Bob?"

"Dad attended the Farmers' Course last year at our agricultural college and that's what the dairymen told him. Some even say to feed only two pounds at a meal for three meals a day. That's good, too, at least for the first couple of days."

"For the first three days I fed Betsey with her own mother's milk. It is best to do that because it starts the calf off right. You know it is called colostrum for the first few days, and how rich and yellow looking it is."

"Say, Bob, it's a wonder you aren't saying something about how clean you keep the lf pails," said Joe. At this remark Bob flared up a little.

"You can poke all the fun at me you want to, but the day is coming when you'll be cleaner with your pails, too. You said your calf had the scours last week. It might have been brought on by using dirty feeding pails."

"I think Bob's altogether too fussy, don't you, Mr. Anderson?"

"No, Joe, Bob is right this time. You see there are always a few drops left in the pails after each meal. This gets sour and it keeps collecting and first thing you know the calf pails are filthy. Before you are aware some of the calves have a bad case of scours. Can't afford to take any chances like that, Joe."

"Betsey and I have agreed to go after the stakes in that contest. She has agreed to win providing I give her a square deal and we are both going to stick to our agreement."

Betsey, who appeared to be listening, tossed her head and threw up her heels as much as to say: "Do you think a clean looking calf like me should drink out of a dirty pail?"

At this Mr. Anderson and the boys laughed outright.

"Yes," continued Bob, "I wash those pails every day with warm water, then I scald them with boiling water. That's the way I keep them free from harmful bacteria."

"Are you very particular, Bob, about having the milk warm when you feed it?"

"You better ask Betsey about that, Joe. Once I let the milk get a little cool before feeding and what a time I had. Why, I had to take it to the house and warm it up. Father says it's better to have the milk as warm as it comes from the cow,—that changing temperatures may cause indigestion in young calves. But Betsey will soon have to learn some new tricks about eating. She is two weeks old today and it is getting about time for her to begin to pick at a little fine hay and some grain."

"I like this idea, Bob, of giving the calves plenty of room and light. I guess you have them in about the lightest part of this stable, haven't you?"

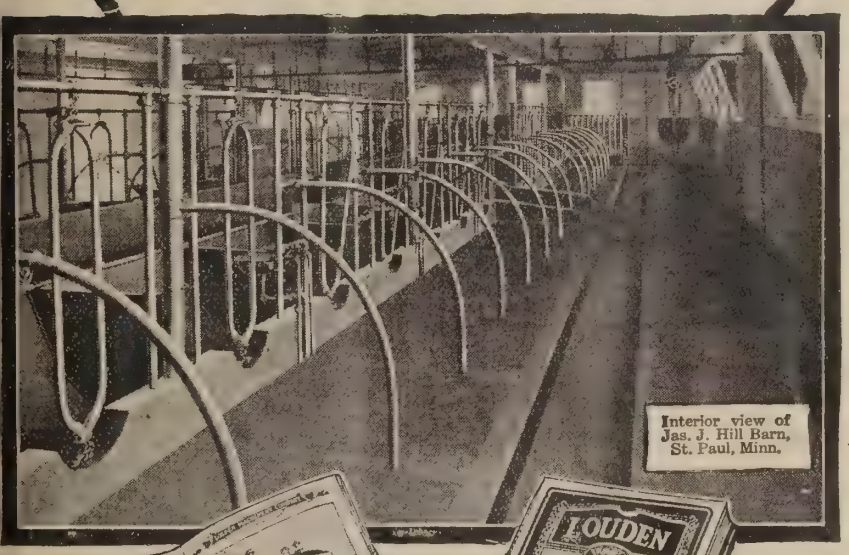
"Yes, Dad let me make this pen. He helped a little now and then but I did most of the work. We weren't using this space a great deal anyway so I thought it would make a dandy place for the calves. When we had the old barn father always kept the calves tied up, and it generally happened to be in some dark corner. We've learned better since. I think good light, ventilation, and some room to exercise in are just about as necessary as good feed. You'd look fine, wouldn't you, Betsey, tied up in that dark corner of our old barn? Guess you'd soon break your part of the agreement we have."

"Yes, old bossies, I wish I had a bigger pen for you but I guess you'll have to get along on what we've got. I allowed you each twenty square feet of floor, so if you don't all want to play at the same time, you can get some exercise. Sometimes, when the cows are all turned out in the yard, I let the calves have the entire run of the stable. What a time they have! They come along, sniffing the floor and acting kind afraid, and when they see nothing will hurt them they go to it, up and down and round and round. That door on the other side of the pen leads into a yard I am making. I'll turn them into that when it gets warm-, but I don't hardly think I'll put them in the pasture in the summer. Flies worry them too much. Father says he thinks they do much better if kept in the barn especially during the worst fly time."

"That's a mighty good idea Bob has about exercise, Joe. All young, growing animals must have that if they are expected to keep in good health. Muscles grow strong with use, boys."

"I notice another thing, too, Mr. Anderson. Calves always seem more contented after they have had a chance to run about. I think it's right down cruel to tie them up with short ropes in some dark corner. Dad said he used to tie them up to keep them out

(Continued on page 874)



A PRIZE WINNING CLUB CALF, CHAMPION HOLSTEIN HEIFER, SHOWN BY ESTHER NEWBY, PORTAGE COUNTY, WISCONSIN, AT WISCONSIN STATE FAIR, SEPTEMBER, 1918

LOUDEN

These Two Books

Help You to Plan and Build a More Serviceable Barn

Louden Barn Plans
112 Pages

This is not a catalog, but a thorough, comprehensive encyclopedia of barn building information. Shows 74 barns of all styles and sizes and other farm buildings, with estimated cost of each. Gives many detail illustrations, with chapters on drainage, ventilation, lighting, concrete work, roof and floor construction, silo building. It is a simple, practical guide, printed in large type—easily read and understood. Sent postpaid, without charge or obligation to any prospective barn builder. Write for it.

Louden General Catalog
224 Pages

Shows the complete line of Louden Labor-Saving Barn Equipment—illustrated and fully described—Stalls and Stanchions, Feed and Litter Carriers, Animal Pens of all kinds, Hay Unloading Tools, Sanitary Water Bowls, Barn and Garage Door Hangers, Cupolas, Ventilators, Power Hoists, Manger Divisions, Hardware Specialties—"Everything for the Barn." You will find the outfit that fits your barn. It will show you how to save over half your barn work. Sent postpaid without charge or obligation. Write for it.

Expert Barn Building Service
Means Economy and Permanent Satisfaction

Now that war restrictions on farm building operations have been removed, you are going to build or remodel that barn to gain more storing and housing capacity.

Whether your contemplated improvement is on a large or small scale you want to keep the material and labor cost down to the lowest figure, at the same time build so that your needs will be fully met for years to come, and have strongest assurance of profitable returns from the investment.

Let Louden Experts Plan Your Barn

It does away with costly and trouble breeding guess work; gives you the benefit of the most advanced thought and practice in barn construction and arrangement—a properly co-ordinated barn in which every detail is made to contribute its full share toward the general economy, convenience and durability, comfort and health of live stock, and daily labor-saving operation.

Service That Meets Your Individual Requirements —Without Charge or Obligation

We maintain the strongest organization of barn building specialists in America for the chief purpose of aiding dairymen and farmers in solving their barn building problems.

Our suggestions and plans are not of the "ready made" kind, but are specially designed to meet your own particular needs, present and future.

Write us briefly what kind of barn you have in mind, the number and kind of stock you wish to care for. Our experts will work out a plan with suggestions that will appeal to you and send you blue prints of same. *No charge or obligation.*

For complete working plans with material specifications, we make a very modest charge.

Labor Is the One Big Item in Operating a Barn

Saving labor is the chief purpose and the proved accomplishment of Louden Barn Equipment. Louden Stalls and Stanchions save time and labor in handling cows, morning and evening; Louden Feed Carriers enable you to serve 20 cows where you served less than ten in the old way, and with the Louden Built-up Feed Saving Curb makes it possible for you to save many a pound of feed that would otherwise be wasted; Louden Litter Carriers make barn cleaning a matter of minutes instead of hours—preserve manure value—increase crops; Louden Sanitary Detachable Water Bowls save all the time of watering cows, supply cows with necessary water at all times—increase milk yield.

Louden Barn Equipment Excels Louden Equipment has stood the severest quality, economy and profitability tests applied by leading American dairy men for many years. It is preferred because of its greater simplicity and strength; its freedom from trouble making attachments; its special features of comfort and safety for cows; its easy installation in any barn, and lasting, satisfactory service.

Louden Equipment is not expensive, and it is not necessary to remodel your barn to install it. An outfit that will fit your barn just as it stands is shown in our big general catalog and will prove a daily profit maker even if you have but a few cows.

Plan your improvements now. Get the Louden Books and Louden Barn Building Service. They will show you how to get the most for your money. Fill out and mail us the coupon today. Address main office at Fairfield, Iowa.

Position wanted by married man as farm superintendent or manager on large dairy farm. Holsteins preferred. University of Wisconsin graduate. County agent and farm managing experience. Lifelong experience in farming. At present managing modern, pure-bred Holstein farm. Thorough knowledge of pure-bred cattle and A. R. O. work. Capable of handling men with maximum results. Believe farm can and should be made to pay. Address BOX 381, care Hoard's Dairyman. 25-2

Am looking for position as manager up-to-date farm or estate. At present managing 800 acres. Nothing less than $1,800 considered. R. MacMURCHIE, Rolling Prairie, Ind.

Single man, agricultural college graduate with life experience on farm, open for position as manager of modern dairy or general farm. Best of references as to energy, character, and ability to handle men. Address BOX 385, care Hoard's Dairyman.

A practical farm manager, thoroughly experienced, would like first class farm or dairy proposition, either on salary or share basis, where all stock is found. American, married, with family, oldest child 12 years. A-1 reference. Prefer place in Pennsylvania, New Jersey or the southern states. Address BOX 384, care Hoard's Dairyman.

Expert dairyman and dairy farm manager open for position. Wide experience and education. Want permanent place. Terms reasonable. No proposition too big. Married. Address BOX 383, care Hoard's Dairyman. 25-2

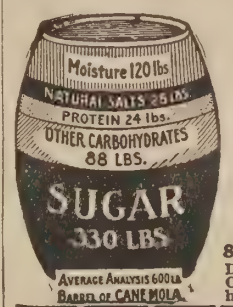
Dairyman—Married, no children, seeks position for care of large herd or entire farm. Some university training. Experienced in all kinds of dairying and farm work. Excellent references from herds I have handled. No booze or tobacco. Address R. W., 323 East Section St., Effingham, Illinois.

Can deliver the goods. Farm manager of ample experience in up-to-date dairy and estate work, can take over any proposition in its entirety. A-1 farmer, dairyman of Advanced Registry and Registry of Merit successes. A hustling, efficient manager getting most from men, stock and farm. First principles of veterinary; construction, simple landscaping, neatest upkeep, accounts. Hogs, orcharding, poultry (eggs three times feed in December). Former employer says can handle anything. Must be convenient to high school. $1,500 first year with opportunity advancement. Will make my own future. Address BOX 382, care Hoard's Dairyman.

Farm manager desires position where energy and ability are needed. Reliable, single. Dairying, stock raising, accounting, soil improvement. First rate builder and mechanic. Specialist in field crops. Agricultural graduate. Satisfaction given anywhere. Reference. Address BOX 389, care Hoard's Dairyman.

Young man wants herdsman job in the West. No small job considered. Prefer Holsteins or Guernseys. Single, American. Can make a change Feb. 1, 1919. State wages and all details first letter. Address BOX 390, care Hoard's Dairyman, Fort Atkinson, Wis.

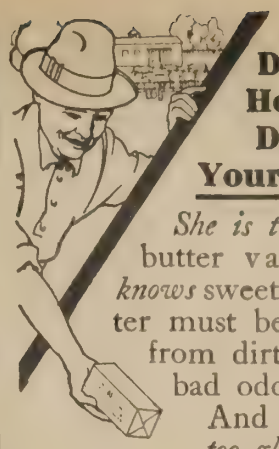
Married man, 35, wants position as herdsman or farm manager March 1. Guernseys preferred. No children. Life experience. References. State wages and particulars in first letter. HERBERT CRAFT, Route 5, Monticello, Wis.



straw, old hay, corn stover, fodder, ensilage, screenings, etc. Saves you the cost of expensive prepared feeds. The cost of Cane Mola is very reasonable.

CANE MOLA

(Not a Prepared Stock Feed)



adds palatability to whatever roughage you have on hand. Eliminates all feed waste. Everything cleaned up in double quick time. Successful dairymen and farmers are continually re-ordering in ever-increasing quantities. Live stock gain weight rapidly. Cows give more milk. Cane Mola is all digestible. Government Experiment Stations endorse it.

Write for Valuable Feeding Information

We will send you our booklet and expert advice on economical feeding. Cane Mola is sold in 600-lb. barrels, or smaller sizes, if desired.

The Victrola's priceless service in home and camp

Measured by every standard, what could be more *valuable*, more concretely *useful*, as well as more delightfully entertaining than the Victrola?

Second only to the actual physical needs of the body is the imperative hunger of mind and spirit for their essential "foods"—music, literature, inspiration, education, comfort and laughter. The Victrola is their tireless servant, bringing to them at any place, any time, the greatest art and entertainment of the whole world.

Victrolas by the tens of thousands are in daily use by our military forces on land and sea. In more than 25,000 public schools the Victrola is helping to build Young America into a better citizenship. The Victrola has taught French to our soldiers, wireless to our sailors and aviators. In millions of homes the Victrola is educating, refining, uplifting our mighty democracy.

Send the Victrola to the boys in camp to cheer and inspire them! Place it in the home for the benefit and pleasure of old and young folks. Prize it for its *value*, its *usefulness*, its *service*, as well as for its unlimited, wholesome pleasure.

There are Victors and Victrolas in great variety from $12 to $950.

Any Victor dealer will gladly demonstrate the Victrola and play any music you wish to hear. **Write to us today for the handsome illustrated Victor catalogs and name and address of nearest Victor dealer.**

No More Punctures or Blowouts.

Perfect Tire Filler Takes Place of Air.

The entire automobile industry has received with considerable satisfaction, the announcement that the answer to the pneumatic tire problem has been found, and the most interesting feature of this announcement is the fact that the statement is not based on theory, but on actual fact, in as much as the new tire filler which will replace air has been put to practical test covering a period of over 5 years and is already in use by over 50,000 automobile owners. This resilient filler is not a liquid, and no inner tubes are used. The material possesses great resiliency, rides like air yet is not effected by punctures; will not blow out and doubles the life of tires. No spare tires or spare rims are needed. It differs from other so-called tire fillers in that it will not flatten or harden and is not effected by either heat or cold.

Tests made by the Ford Owner's Club, Widney Resiliometer, Technical Universities and over 50,000 users prove that this remarkable tire filler rides like air over the roughest roads and every indication points to its acceptance and adoption by the automobile industry as a successor to air in automobile tires.

The material is called Essenkay and is manufactured by The Essenkay Products Co., 93-220 W. Superior St., Chicago, Ill. Mr. J. A. Jonson, Sales Mgr., is offering a free trial to car owners of this wonderful material with a view of having car owners test it at the manufacturer's risk and then tell others of its wonderful merits. Auto owners should write Mr. Jonson at the address above for details of his free trial offer.

When writing advertisers please mention Hoard's Dairyman.

Hank pinned the bee on Ed for fair

Ed never could see any chew but a big hunk of oversweet tobacco. "You take this plug of Real Gravely," says Hank. "Take a small chew—two or three squares. See how long it holds its pure, rich taste. If you don't admit that Gravely gives you tobacco satisfaction without extra cost, I'll buy your plug for a month." Hanged if Ed didn't walk in next day, grab off a plug of Gravely and throw down his money just like a little man!

• • • •

It goes further—that's why you can get the good taste of this class of tobacco without extra cost.

War Days on the Farm

(Continued from first page.)

and silos. We sold quite a bit o 150 bushels of potatoes, half of th at $1.25 a bushel and half at $1. I put a sign out in front of the ho and sold quantities with no expe of drawing to market. As for t beets—we have ordered a supervi of tests for November but as th men are very scarce owing to the cent draft, we may not secure o In which event, the beets will be c sidered too good for every day c diet and they will be advertised a probably sold at $1 a bushel to th more fortunate in getting teste Corn was not up to scratch this y and the 14 acres failed to fill our t large silos.

I forgot to say that during the l week in August, 12 head from o herd went to the county fair wh they took a goodly share of hono advertised themselves satisfactori and brought home $85 in cash. T took four days and the time of bo men. As the fair was held only fi miles away, one man came ho nights to attend to chores.

As on probably every farm this w year, many things with us were l undone which ought to have be done. Two men simply could n harrow and prepare the ground thoroughly as should be done to sure maximum crops—especially no fall plowing was accomplish The corn showed the lack of sufficie cultivation, for instance. But there one thing certain—if you work eve minute—just as fast as you can a work scientifically, efficiently, a still can't keep up—surely one h done his "darndest", as the the c miner said, and "angels couldn't no more". I imagine that such h been the case with many farmers t year who are trying to do doub work with half the help. One m not quibble over how the results we obtained—but get results someho

We are ready for winter, or least more so than a month ago. T men are hurrying to finish a calf ba which was started early in the f by a local carpenter. There were no a ples to pick because our orchards he abouts winterkilled. But the dai has to be milked and chored and ke in condition—for we are putting our faith and all our hopes into and hanging on and fighting a working for it in our youth so th in our old age, that dairy will care f us! We have only been in the pur bred business three years and li the hero in "Woodman, Spare Th Tree", we are being very good to t herd and pray for financial protecti later on from it.

My husband and I are both und 30 years of age. We own no car care little for the fleshpots of life b much for the wherewithal to keep t war away from our doorstep and t wolf from the door. Therefore, though far from debtless, we ha bought a few Liberty Bonds, a fe more War Stamps, and Hooveri very correctly and willingly.

We have worked harder this ye than we would care to continue to forever, but this is an exception time and nothing is too much to u dertake.

The farm is an Oliver Twist—a ways asking and demanding mo work. We learn that our good help is to leave us November first to wo in a knitting mill at big wages. T same old story. If he never return that will leave my husband and m self to cope with work alone anoth year. But perhaps we will be in Be lin by that time.

The Surest Way To Make Dairying Pay

Here's the Way to Stop Cream Waste

ABOUT 8 out of 10 farmers with dairy herds are wasting cream every day. **They are actually feeding cream to pigs**—simply because they are using inferior cream separation machines.

Sweden's Lesson for America

Sweden's farmers won't tolerate the slightest cream waste, Their economy has perfected the most economical, fastest greatest labor-saving cream separator—the **Viking.**

See the Viking Get All the Cream

There is no cream waste with the **Viking Cream Separator**—Sweden's most popular separator. It will pay you to investigate. Write your name and address on the coupon below and mail it to us. See a **Viking** work. You can do that by looking up the **Viking** dealer the next time you are in town. He will be glad to demonstrate it to you.

You Save Money Right At the Start—You Make More Profits All the Time

conomical production and the largest cream separator factory in the orld enable us to sell the **Viking** at a price that means a money-saving you. **The Viking has a greater capacity than any other separator f equal rating.** Experts' investigations prove that the **Viking** has approximately 100 pounds of milk **per hour** greater capacity than many eparators for which much higher prices are asked.

The Closest Skimming Machine Ever Perfected

ests show that the use of a **Viking** on dairy farm herds of 10 cows saved over 107.00 worth of cream that **before** had been actually fed to the hogs. The iking will both **save and make money for you.** See your nearest Viking dealer.

Over One Million In Use

VIKING CREAM SEPARATOR

Guaranteed For A Lifetime

Made in the World's Largest Separator Factory

World-wide demand makes it necessary to produce over 180,000 **Vikings** per year. Each **Viking** is made of finest quality Swedish iron and highest grade tool steel. No separator **at any price** uses finer tool steel in its working parts. Furthermore, it is marvelously simple in its design. That's one of the secrets of its economy of first cost—and also the reason why it operates so easily. You know that all of the average hard-running separators are bound to waste cream. Their hard-working mechanism makes the whole separator vibrate—tremble. This causes the cream to mix with milk. The result is waste of costly cream through the skim-milk spout.

The smooth, easy action of the **Viking** (which starts the minute you move the handle) distributes the milk in thin, even, smooth layers over the discs. The cream **naturally** separates from the milk. You get more cream; do less work.

Get These Two Books If You Want More Milk Money

These books are not merely advertisements for the **Viking.** They serve a larger purpose. One of them—"Making The Dairy Cow Pay"—is packed with profit-making ideas, methods, systems for the dairy farmer. Even though you don't believe you will buy a **Viking** this year, write for these two books. We would be glad to feel that they had been some help to you, even though you never buy a **Viking.** Write for them **right now!**

LALLEY LIGHT *and* POWER

Longer Winter Days; Real Cheer at Night

ON thousands of American Farms, Lalley-Light is making these short days longer, and saving labor at every turn.

Its brilliant, utterly safe electric light helps men finish the morning and evening chores-in-the-dark in less time; and do better jobs.

Its endless electric power performs much of the necessary daily work in house and barn.

To the home it brings cheer and comfort not to be had by any other means.

All with a certainty of low cost and reliability, assured by more than eight years of every-day use on every-day farms.

The nearest Lalley-Light dealer will be glad to show you a plant in operation; and we will mail descriptive literature if you will send your name and address.

Actual Lalley-Light installation in home of S. A. Gibson, Roanoke, Texas

Lalley Electro-Lighting Corporation, 763 Bellevue Ave. Detroit, Michigan.

LALLEY-LIGHT

THE ELECTRIC LIGHT AND POWER FOR EVERY FARM

Cropping System With Alfalfa

Mr. Rufus A. Morrison of Indiana writes: "In the article of D. H. Otis, 'Feeding Legumes in a Systematic Rotation', he writes that Mr. Michels is putting his herd in the Registry of Merit on alfalfa hay and corn silage, with very little grain. Would it not be well to tell the story somewhat in detail?"

"I am trying to get settled on a systematic rotation. I have two farms with 80 acres of land in each. We keep all the cattle that the land will support. Is there any better rotation than 20 acres of alfalfa, three years; 20 acres of corn for silage; 20 acres of wheat or barley; and 20 acres of grass, clover, alfalfa, timothy for pasture? The alfalfa in the above rotation remains during one rotation of the other three fields when it goes into corn and one of the other fields goes into alfalfa. Is a three-year rotation too short? We must have 20 acres of corn and prefer it on sod. I wish to start a system that will give us a definite plan for the future."

In regard to feeding dairy cattle on alfalfa and corn silage, I will say that there is considerable difference of opinion in regard to the advisability of such a course. Mr. Michels has made a success of his proposition. Fortunately he has located on land that produces a first class quality of alfalfa, and he can be reasonably sure of a crop. He aims to cure it in the best possible condition. Under these conditions he has a feed that his cattle relish and which possesses a large amount of nutrient. The analysis of a good alfalfa hay shows it to be approximately on a par with wheat bran. There is no question but that the grain bill can be very greatly reduced where a good quality of alfalfa hay is available. We do not recommend that a dairyman leave off feeding the grain abruptly, but it would be possible to gradually reduce the grain allowance, watch the milk sheet, and likewise the condition of the animals, and then decide at what point he is getting the most economical returns for his feed, and at the same time maintaining his breeding herd in good condition. Many a dairyman has been able to reduce his grain ration at least one-half. Mr. Michels has gone a few steps farther, and has practically eliminated grain under his conditions. It must be remembered that Mr. Michels feeds all the alfalfa his cows will consume and does not expect them to eat the coarser parts. To a large degree the cows consume the leaves and fine stems, the coarser stems that are left being fed to the horses.

Relative to the rotation suggested by Mr. Morrison, will say that if his land is suitable for the production of alfalfa and he is reasonably certain of his crop, it would be perfectly proper for him to set aside 20 acres for alfalfa. If his land is not adapted, or if it is an uncertain crop, it would be better to begin with a much smaller acreage and gradually increase this as fast as he demonstrates that it can be grown successfully.

Assuming that he can grow 20 acres of alfalfa satisfactorily the remaining cultivated land he has divided into three fields of 20 acres each, and expects to devote one field to clover, alfalfa, and timothy for pasture. If he has in mind seeding his clover, alfalfa, and timothy with his wheat or barley, and then pasture it the following year, it is possible that his plan will work. Ordinarily, we figure on the seeding to remain at least two years. The first year when the legumes predominate it is usually devoted to h and the second year when timo comes in more abundantly, it is dev ed to pasture. This plan has the vantage of distributing the risks o hay crop, as the sole reliance is then made upon the alfalfa field. F thermore, the clover and timo meadow will furnish hay that is pecially good for horses. We wo suggest that if this correspondent sires to have pasture in rotation t he divide his land into about six fie as nearly equal as possible. Dev one to alfalfa, and with the remaini five follow a five-year rotation, c sisting of clover and timothy meado followed by pasture, this followed two years of corn, followed by a se ing down to grass while producing crop of wheat or barley. This rangement will provide for a lit more hay, but divided between alfa and clover and timothy. It also c down somewhat the pasture acrea This, however, is not serious, as t pasture can be supplemented eith with silage or soiling crops. If t suggestion provides for more co than is needed, part of the corn ar could be devoted to any other annu crop desired and still fit into the r tation scheme.

If this correspondent is not in p sition to eliminate the pasture entir ly, he could then follow the plan suggests of dividing his land into 2 acre fields. If this is done we wou advise the seeding of clover witho timothy and plowing under the seco crop the following year.

The suggestion of this correspo dent that the alfalfa field be allow to remain for three years and th plowed up and put in corn and see ing another field to alfalfa, is a go one.

D. H. OTIS.

Wisconsin College of Agriculture.

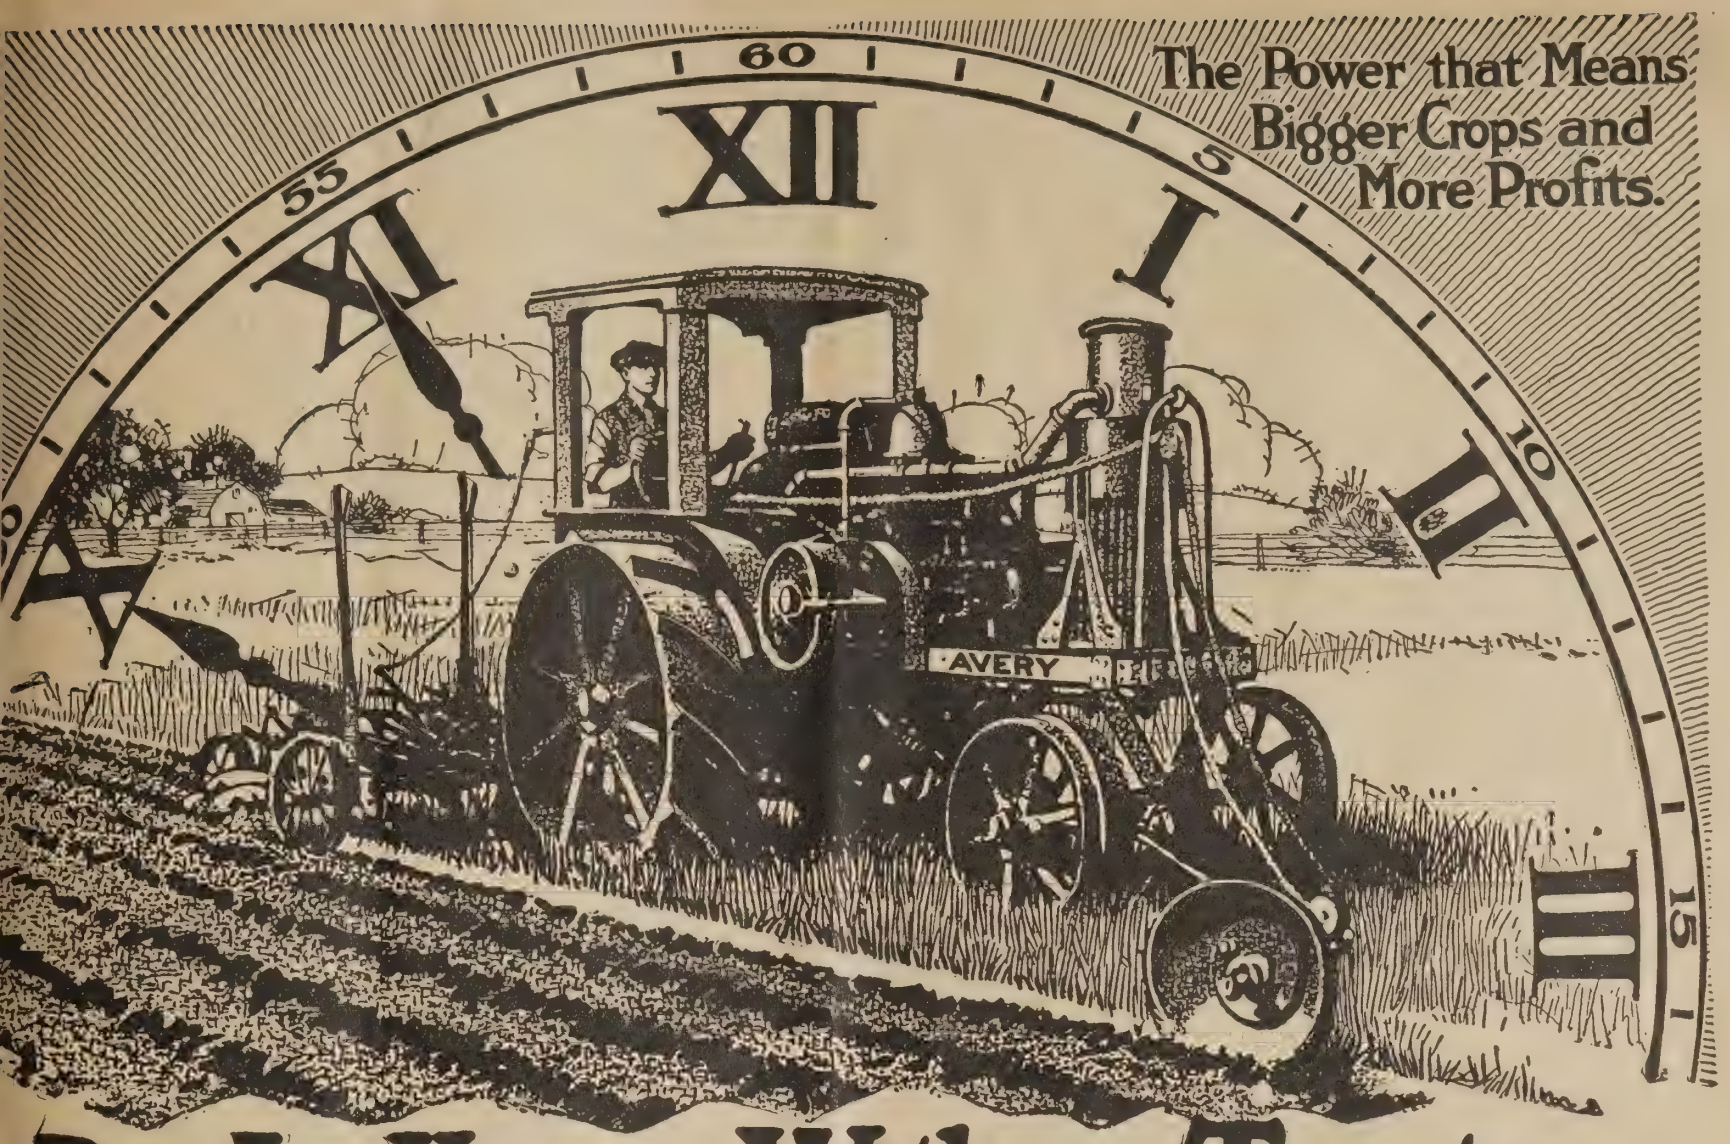
Grain to Supplement Corn Stove Timothy and Red Top Hay and Straw

Please tell me what grains wou make a balanced ration for Guernse cows just freshened. We have quant ties of ground oats and corn silag and for roughage we have corn stove timothy and red top hay mixed, an oat straw.

Mechanicsville, N. Y. C. W. F.

We would let each cow have abo 30 lbs. of corn silage daily and a libe al allowance of the timothy and re top hay and some of the corn stov to pick over. We would not for cows to eat the coarser part of th corn stover, nor would we feed an straw unless there was not enoug corn stover or hay to supplement th silage during the winter.

A mixture consisting of 200 lb ground oats, 200 lbs. ground corn o barley, and 300 lbs. gluten feed or di tillers grains, and 100 lbs. of cotto seed meal or oil meal will make a ver desirable mixture to supplement th roughage. It will require about pound of this mixture for each 3 t 3½ lbs. of milk produced; that is, cow giving 24 lbs. of milk will requir 7 to 8 lbs. of grain, and if she gives 2 lbs., it will be 8 or 9.



Finances of National Dairy Union

Receipts

Balance on hand Nov. 1, 1918	$3804.0
Total receipts	59.9
	$3863.9
Total disbursements	459.9
Balance on hand Dec. 1, 1918	$3404.0

This is to certify, I have today au dited the books for S. B. Shilling treasurer of the National Dairy Un ion, and find the receipts from Nov 1, 1918 to Nov. 30, 1918 to be $59.97 and the amount paid out for which he holds vouchers, the sum of $459.97 leaving a balance on hand Dec. 1 1918, of $3,404.02.

F. P. COLLYER, Auditor.

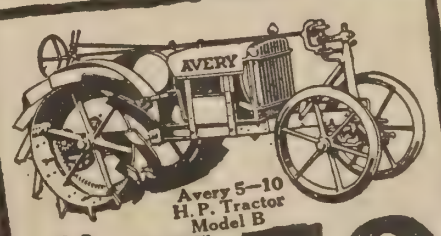
Do In Hours With a Tractor Work That Takes Days With Horses

PLAN your time this year in hours of tractor work instead of days of horse work. Start this year's work with a tractor and get your plowing done at exactly the right time and raise bigger crops. Do your work with less hired help, or farm more acres with the same help. Let an Avery tractor make you as much money in a few hours this year as you made in a day before, with horses.

What You Get In An Avery Tractor

You get a tractor with a "Draft-Horse" Tractor Motor built in our own motor factory *especially* for tractor work and *only* for Avery tractors.

You get a tractor with a "Direct-Drive" Transmission that is the simplest tractor transmission system built and which delivers more of the power of the motor to the belt wheel and drawbar.



You get a tractor with these Avery exclusive and protected features—renewable inner cylinder walls, adjustable crankshaft boxes, duplex kerosene and distillate gasifiers, double carburetor, practically unbreakable crank shafts, round radiator, sliding frame transmission, universal self-cleaning, non-slipping lugs, etc.

You get a tractor that is built complete in the three large Avery factories which insures one high standard of quality; a tractor that is backed by national tractor service through our branches, distributors and dealers which insures prompt and permanent service; and a tractor that is successfully used by farmers in every state of the Union and in 61 Foreign Countries.

Write Now for the New 1919 Avery Motor Farming, Threshing, and Road-Building Machinery Catalog

Get all the facts about the complete line of Avery Tractors, built in sizes for every size farm, with the smallest size tractor selling at only $550.00, f. o. b. Peoria—the Avery Motor Cultivator with which you can cultivate corn, cotton, etc., with motor power—and the complete line of Avery Grain Saving Threshers and Plows for every size tractor.

TROPICAL

There is no class of citizens in America which realize the imperative necessity for conservation at this time as do the dairy farmers. One of the best ways in which you can conserve is by prolonging the life and increasing the serviceability of your buildings and of your home.

TROPICAL ELASTIKOTE

Superior For Barns and Out-Buildings

Shortage of labor has caused wages to increase fabulously. Two-thirds of the cost of every painting job goes for labor, so you cannot afford to use poor paint. TROPICAL ELASTIKOTE outwears the ordinary paint many times over, and is undoubtedly the most economical on the market. No matter what the variations of surface or weather conditions, TROPICAL ELASTIKOTE, which is now supplied in sixteen different shades, will fill your needs.

ERIE HOUSE PAINT or TROPICAL FINEST HOUSE PAINT—For Your House

Better and more economical than hand mixed paint. Manipulated, ground and mixed by the best and most economical equipment obtainable. The "cost per year test" proves them best.

B & P Special Enamel For Interiors

is the favorite paint with dairy farmers for inside walls and ceilings. Non-absorbent, it completely seals all the pores in the surface. Can be flushed spotlessly clean with a hose. Supplied in beautiful shades of cream, gray, blood red, slate, yellow, and white.

He is an authority on Guernsey and Jersey cattle, and son. of the finest specimens of these cows have recently been donated through him, to stock the dairy farm at the American hospital at Sarisbury near Southampton, England, where accommodations are being prepared for 3,000 American soldiers, sick and wounded.]

Farmers' Week in Connecticut

Arrangements are under way for a great Farmers' Week at Hartford, Conn., beginning January 20th. In the past each division has held a very successful program during the winter and already not less than eight of these organizations are co-operating with the State Council of Defense and the Agricultural College upon this big event. Nothing will be spared to make it the biggest event of this kind in this part of the country. The meetings will be held in the State Armory.

As you know this state has strong dairy interests. While its problems are largely connected with the whole milk and ice cream business, there is a growing interest on the farm for butter and cheese equipment. Anything that pertains to keeping the cow under more comfortable and healthy conditions is of practical interest as are also all matters pertaining to the production and distribution of a clean, wholesome product.—G. C. WHITE.

Fertilizer Feeds the Crops That Feed the World

TWO HUNDRED MILLION people eat foods grown largely by the aid of commercial fertilizer. In the United States alone nearly seven million tons of fertilizer are used annually.

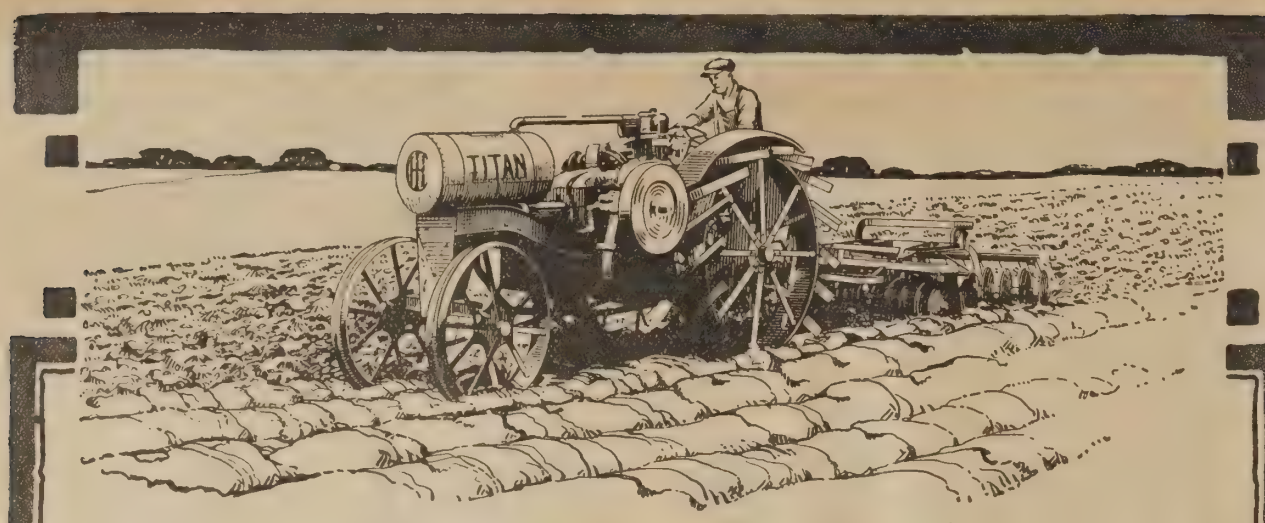
The Fertilizer Industry performs a most valuable service in searching the four corners of the earth, gathering sulphur from Spain, nitrogen from Chili, phosphate from Florida and Tennessee, and potash from the West; in recovering waste materials from slaughter houses, factories and cities; in reaching up into the air and down into the bowels of the earth for newer and cheaper forms of raw materials; and then manufacturing the whole into a product, definite in composition and convenient in form, which can be transformed into essential life-giving foods.

The machinery, buildings and equipment necessary to perform this great service represent an investment running high into the millions of dollars.

Without fertilizer, agriculture would deteriorate. With *more* fertilizer, agriculture will improve. The use of fertilizer is rapidly becoming universal, and the *best* use for the *greatest* profit should interest every farmer wherever located.

Have You Investigated the Possibilities?

Old theories are being discarded. New fields for profitable use of fertilizer are rapidly developing. Have you thought of fertilizing that weedy, run-down pasture? Do you know that fertilizer can help you to avoid soft corn? escape the Hessian Fly? overcome drouth? save farm labor? get higher prices? Study fertilizer. Let fertilizer make bigger profits for *you*.



Write for our interesting bulletins on fertilizer usage

The Tractor to Buy

ARE you one of the many farmers who need more power to handle the farm work properly? Do you have to work with less help than you need?

If so, you need an International kerosene tractor. The size that gives you power for your heaviest load will handle all the work. Internationals use only as much fuel as the load requires. They are made to work with farm machines—the kind you are now using—and special hitches are provided for all kinds of field and road work. Their belt pulleys are large enough to prevent slippage, run at correct speed, and are set high enough to keep the belt off the ground. They all use kerosene or other low-grade fuels which means a big saving in operating expense.

The Company to Buy From

You know that we have supplied farmers with high-grade machines for nearly 88 years. You know that our tractors have furnished satisfactory farm power for more than 12 years. We have far too much at stake to market machines of any but the highest standards of quality. We expect to come back some day and sell you some other machines in the long list you see in this advertisement. In every sale we try to build for the future.

Tractor Service Whenever Needed

In line with this policy, we have developed a service organization which now consists of 89 branch houses and many thousands of loyal local dealers, wide awake and attentive to the needs of their customers. Service is a very essential part of any tractor sale. When you buy an International kerosene tractor you buy with it the assistance of an organization that brings a well stocked branch house or a live, local dealer within telephone call, fully equipped to keep your tractor working steadily.

International Tractor Sizes

International tractors, all using kerosene for fuel, are made in 8-16, 10-20, and 15-30 H. P. sizes. A line to the address below will bring you full information about all our tractors and about any other machines you mention in the list shown in this advertisement.

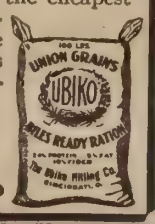
Highest *Natural* Milk Flow

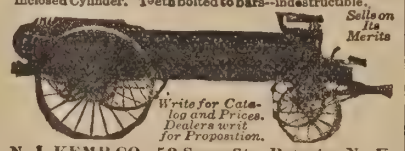


UNION GRAINS brings cows to their highest natural milk flow, keeping them there without danger to health or utmost usefulness. It does this because protein, carbohydrates, fats and mineral matter are present in exactly the right proportion. Its perfect composition is proved by the 15 years of continuously excellent results it has given.

UNION GRAINS

The Perfectly Balanced Ration for Milk Production

It is always the same scientifically mixed ration, containing nothing but the purest of grains. No fillers. It bulks well. It digests. It is palatable. Considering the amount and richness of milk production it is the cheapest dairy feed procurable. Any dairyman will convince himself of this by trying Union Grains and keeping a record on the form which we will gladly send. Any dealer can get Union Grains for you *now*. Don't wait to order—there is a 3 million-ton shortage of dairy feeds and traffic conditions are likely to again be bad



Keep a record of feeding results. Send for a Union Grains Record Sheet.

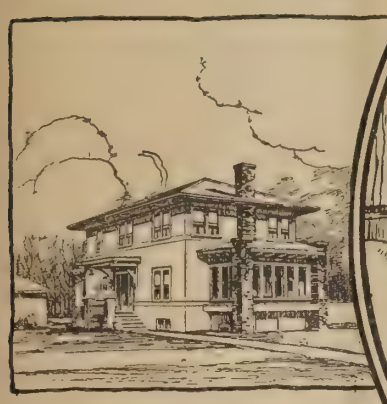
Pure-bred Cattle in Connecticut

HOARD'S DAIRYMAN:—Within a decade great interest has developed in western Connecticut in the breeding of pure-bred stock and cattle especially. This has been particularly noticeable in the counties of New Haven, Fairfield, and Litchfield. The Holstein-Friesians are the greatest favorites; and there are more breeders of these cattle than of any other largely because nearly all of the creameries, which used to be numerous here, have been driven out by the demand for market milk to supply the nearby cities of Bridgeport, New Haven, Waterbury, Danbury, and New Britain. Several years ago the Western Connecticut Holstein Breeders Association was formed. Now this organization has been merged with the Connecticut Holstein Breeders' Association.



But our good and wealthy town of Woodbury has for some reason held back from the keeping of large herds of pure-breds. The use of pure-bred sires in many cases has been recognized as profitable, however, and large numbers of choice grade cows have been raised. But now the leaven has begun to work in earnest, due perhaps to the good prices received for milk (now $4.08 per forty quart can), and with the increased interest in milk making comes inquiry for the best cattle. Nearly all of the milk is shipped to Waterbury by trolley and no city has in the past year requested producers to keep back so little surplus.

War conditions having made the price of grain high, our New England farmers have learned that they can raise corn, oats, and wheat to advantage, and the past two years have witnessed a wonderful growth of these cereals, greater perhaps than have been produced in any two years within 150 years. Our dairymen have consulted together and decided that they may do better even than they have yet done. This has resulted in the request for extension service from the Storrs Agricultural College and Experiment Station. We shall have a four days' program in January and from present interest there will be a full attendance. During the past week a preliminary meeting was called, addresses being made by Hon. C. E. Hough, a pure-bred breeder of Washington, and by a neighbor in the same town, Mr. Paul Farrand, also a breeder of pedigreed stock. Mr. Hough advocated the ownership in Waterbury of a plant to receive all the milk this and adjoining towns make, the same to be carefully retailed on a co-operative basis, stating that 2 cents per quart could be saved in its distribution and still pay the producers a higher price than at present. He said: "If the United States government carried the mails and delivered letters as milk is delivered all over the land, a single postage stamp would cost 15 cents."

Connecticut. HOLLISTER SAGE.

Help Wild Birds This Winter

Winter is the adverse season for most of our birds. If severe, scarcity of food is sure to occur, and the birds soon weakened, fall victims to the cold. Birds, in general, are of great value in destroying injurious insects, and their numbers should be kept up to the standard necessary for their most effective work. Help them, therefore, by feeding them in winter, especially in the northern states when there is heavy snow. Bulletins containing directions for the winter feeding of birds, and posters calling public attention to the desirability of winter feeding, may be obtained from the Bureau of Biological Survey, United States Department of Agriculture.

Order from your own lumber dealer

Your lumber dealer is an authority because he has at his fingers' ends the sources from which to secure the best available information on homebuilding. So through him you have at your command our half-century's knowledge of interior designing and the benefits of all the things we have learned.

Your lumber dealer takes care of the material. He shelters it from weather, accident, and loss. He does not deliver it to the building site until the moment it is needed.

CURTIS Woodwork comes to you put together but uncolored. You select your own decorative schemes; you have your own choice of verandas, doors, colonnades, windows and stairways—built-in sideboards, buffets, breakfast nooks and other distinctive furniture — modern, cheerful labor-saving kitchen equipment and many kinds of other beautiful and useful things that are grouped under the trade term "woodwork."

Build a *Home* instead of a *House*

When you build into it your own individuality, your own desires, and your own oft-dreamt dreams—then you have a home.

When in its planning someone else has had most of the say—then it is only a house, no matter how great the cost.

CURTIS Woodwork gives the man of moderate means the opportunity to put into his home the refinement, the distinctiveness, the originality, and the exclusiveness that is seldom found outside the residences of the well-to-do.

Because in our Standard Designs the variety of choice is so great that you have all the satisfaction of made-to-order service without its high cost. A home equipped with CURTIS Woodwork is half-furnished when you move into it.

To the right is a description of our interesting and handsome free books. Read this description and write for one of these books today, no matter when you intend to build.

Get one of our interesting free books

Actually to see the difference between a *house* and a *home* get one of our books. There are two of them. You may have either or both FREE. One shows homes that can be built for $4000 and under; the other book pictures homes that cost more than $4000.

Each house is shown and described in considerable detail—first the exteriors, with complete floor-plans, and then the interiors that show the economical, artistic and practical use of CURTIS Woodwork.

Whether you intend to build now or later, you should have immediately the book that deals with the kind of house you want. It will help you to mould your dream-home into reality.

A Letter from Bossy

If a cow could speak she would talk about her health as people do—because cows suffer from ailments, little and big, the same as human beings. When a cow is sick, she needs medicine as much as a sick person does.

Mere rationing will not eliminate disease; medicinal treatment is necessary. The most common cow ailments, such as Abortion, Retained Afterbirth, Lost Appetite, Bunches, Scours, etc., result from a diseased condition of the digestive or genital organs. Any of these diseases and many others can be successfully treated or prevented by using Kow-Kure, the great cow medicine.

Kow-Kure is scientifically prepared for the treatment of cow diseases only. It puts the vital organs in condition to eliminate disease and function regularly. Prevent sickness by occasionally using Kow-Kure. Feed dealers and druggists sell it—60c. and $1.20 packages.

Free book, "THE HOME COW DOCTOR," sent on request.

Dairy Association Co., Lyndonville, Vermont

"What Will the Baby be Like?"

A question every expectant mother asks a dozen times a day. Does she know that the answer largely depends on her own health, and that her own intestinal system, which is especially liable to constipation, must be kept clean or it will encourage the breeding of serious disease? There is sound medical advice to every prospective mother in a booklet called

"The Days That Go Before"

which will be sent on request, free, to any address. Write today — it may save your baby's future.

Stocked Legs

We have a three-year-old colt that stocks in the hind legs. She gets plenty of exercise. Kindly let us know if there is any remedy.

Houghton, Mich. M. C.

Allow the filly a roomy box stall when in the stable, or turn her loose in a shed. Each time she comes in rub her legs dry and then bandage with flannel from feet to hock joints. Feed her well on whole oats, wheat bran, carrots, or a little sound silage and good, mixed clover hay. If worms are found in the feces, mix in the feed twice daily for a week a level tablespoonful of a mixture of two parts of table salt and one part each of sulphur and powdered copperas. Then stop for ten days and then repeat the treatment. Omit copperas if she is in foal and increase salt and sulphur.

Congested Udder

1. What do you consider the proper way to handle a fresh cow that is a heavy milker when the udder is badly caked?

2. What precautions can one take to prevent milk fever?

Wisconsin. R. E. W.

1. Congestion of the udder will be much less likely to occur if a cow is "dried off" for 6 weeks before calving and during that time is made to take exercise every day and is lightly fed and in such a way that bowels will be kept active. Avoid heavy feeding or protein-rich rations. Chill of the udder from exposure or lying upon cold ground or a cement floor also causes many cases of congested udder. Treat by giving a physic, massaging several times a day, stripping away some of the serum or milk before calving if the case is severe and giving two teaspoonfuls each of powdered saltpeter and poke root once or twice daily after the physic has acted if the condition persists.

2. Follow above advice as to feeding and exercise during pregnancy and when the calf comes either allow it to suck for a few days or refrain from milking the udder dry for a few days. If the cow is fat and costive give a physic when it is seen that she is about to calve. Keep the stables clean and cool. Hot, stuffy stables help to induce milk fever.

Congested Udder

There is a heifer among our herd that is going to get her first calf. About three weeks ago she started to make up her bag and she still did not calve yet. Her bag is hard in places and specially round and above the teats. When I tried to milk her out some days ago I noticed she had lots of dark brown matter in the udder, which, however, does not seem to be sore. After doing this for a few days the matter got thinner and more normal looking. Then I ceased milking her out until two days ago when I noticed her bag getting hard again. I started stripping again and she produced the same kind of matter. Please advise me. Shall I keep on stripping or shall I do something else? What causes this?

Mount Vernon, Wash. G. C. W.

It is not unusual to find serum, or even blood, in a congested udder just before calving and as a rule only enough of it should be removed to relieve congestion when acute. Reduce rich feed, open the bowels, and give daily exercise in such cases. Also, massage the udder well three times daily and rub the milk veins and swelling on the belly in the direction of the heart. In severe cases, two drams of powdered saltpeter and poke root given once daily in water, or a little soft feed, usually helps. If the udder becomes hot and sore, foment with hot water three times daily, strip clean, and then rub in a mixture of equal quantities of carbolized oil, camphorated oil, and druggists' soap liniment.

Clean Out Abortio

From Your Herd

IT CAN BE DONE BY THE PERSISTENT USE OF

Hood Farm Abortion Remed

and

Hood Farm Breeding Powd

Hundreds of breeders have sav valuable cows and their calves by g ing the Abortion Remedy promptly a freely on the first sign of abortion.

13,036 lbs. MILK—720 lbs. FAT

the average production of the grandams of our Owl-Interest bull calf No. B. 68, dropped ril 20, 1918.
His sire is Sibley's Interested Prince, R. of M., who is transmitting the production and richss of his dam, 15,147 lbs. milk, 875 lbs. fat.
His dam is Mertha's Temisia, now on test, 3,128 lbs. milk, 163.8 lbs. fat in 3¼ months to date.
er dam made 10,925 lbs. milk, 565 lbs. fat at 11 years, 10 months old.

MOOSE HILL FARMS, Spencer, Massachusetts

MESCALERO JERSEYS

Do you want to breed beauty and type, plus *By-Production, Size and Constitution?*

Then write us for description and prices of several extra fine bull calves out of Register of Merit dams and strong in the blood of Rochette's Noble, Gamboge's Knight and Sybil's Gamboge.

Rochette's Golden Princess has just finished her year's test and qualified for R. of M. with following record: Milk, 15,286.5; fat, 752.6.

With just 22 cows in milk, we have already made four records in excess of 700 lbs. fat in 1918.

Does this mean anything to you?

MELDRUM GRAY, ROSWELL, NEW MEXICO.

IROQUOIS FARM

AYRSHIRES

High production animals of the best milking and prize winning strains of Scotland, Canada and the United States. A few bull Calves for sale.
F. A. CLARK, Proprietor. - WALDO C. JOHNSTON, Agent.
Cooperstown, New York.

GUERNSEYS

Tabulations made by the U. S. Department of Agriculture show that the average income over cost of feed from one cow that produces 450 lbs. fat is equal to the average income over cost of feed from 20 cows that produce 100 lbs. each. The average of all official Guernsey records is 450 lbs. fat. Learn more about these profitable cows. Ask for our free booklet "The Story of the Guernsey".

RED CLIFF DAIRY, - Blackville, S. C.

A SON OF KING OF THE PONTIACS

The World's Greatest Proven Sire

For $350

This is half his value—but his color is against him, as he is nearly all black. He was born in August, is a splendid individual, and is out of a 19-lb. 3-yr.-old. Don't miss this chance of a life time.

Geoffrey G. Burlingame, Cazenovia, N. Y.

$300.00

Buys a Son of the Great Sir Veeman Hengerveld

Bull calf born Oct. 20, 1918, a large growthy fellow, and a fine individual.

Sire:—Sir Veeman Hengerveld, the latest century sire, and the only living sire with sixteen 30-lb. daughters. His daughters average the highest for butter and third highest for milk of any sire having 60 or more A. R. O. daughters.

Dam—Blanche DeKol Segis, a granddaughter of King Segis, and has the following A. R. O. record: Butter, 7 days, 28.48; 30 days, 109.86. Milk, 7 days, 617.9; 30 days, 2,604.

This young bull is offered at less than half his value, on account of his being dark in color.
W. D. ROBENS, POLAND, NEW YORK.

Owing to Long Continued Illness—

I have decided to sell immediately part or all of the Lakeside Herd, including heifer calves, yearling heifers, bred heifers, cows and bulls of various ages, several of them from dams with records of 30 to 35 lbs. butter in a week. A rare chance for parties who wish to breed a high class, embracing individuality, breeding and production. E. A. POWELL,
904 W. Genesee St., Syracuse, New York.

WM. N. OSBORNE, WANATAH, IND.

FOR SALE—A YEARLING BULL

of 5% breeding, whose dam's 3-yr.-old record with two of her three nearest dams and his sire's three nearest dams, average 29.62 lbs. butter in 7 days. His sire from a daughter of Hengerveld De Kol, and sired by a son of K.P. Pontiac Lass. His dam by a 27-lb. son of Colantha Johanna Lad. Also, bull calves sired by a son of King Segis Pontiac, and whose dam is a daughter of Pontiac Korndyke. Priced for quick sale. For further information write, GLENN WILSON, Wanatah, Ind.

Uneeda King Alcartra Pontiac

Born January 3rd, 1918

A Real Winner For Some Small Breeder or Beginner...

IT WOULD BE HARD to find a better individual than this young bull. He is marked about three-fourths black.

HIS DAM HAS MADE 21 lbs. butter in 7 days as a two-year-old. In 30 days she produced 78.86 lbs. butter from 1,755.2 lbs. milk.

SHE IS FROM Marion Korndyke DeKol, a cow with a record of 28.23 lbs. in 7 days from 648.60 lbs. milk. As a junior four-year-old she made 27.86 lbs. butter from 565.90 lbs. milk.

THE DAM'S SIRE is Korndyke Pontiac Aaggie, a son of Aaggie Alban Shadeland, 30.52 lbs. in 7 days from 616 lbs. milk.

HE IS SIRED BY Korndyke Pontiac Pet, a son of Pontiac Korndyke, who has 147 A. R. O. daughters, two of them above 40 lbs. and 19 above 30 lbs.

THE SIRE OF Korndyke Pontiac Pet is Pontiac Pet, 37.68 lbs., a former world's champion and daughter of Pontiac Korndyke.

NOW, COMING BACK to the sire of Uneeda King Alcartra Pontiac is the famous young sire, Uneeda King Alcartra, a full brother to King Joh.

HE IS FROM Uneeda Korndyke Abigail, the 33-lb. daughter of Johanna McKinley Segis, the only 40-lb. son of the famous King Segis. His dam is Johanna DeKol Van Beers, 40.07 lbs. in 7 days.

UNEEDA KING ALCARTRA is sired by the $50,000 bull, King Segis Pontiac Alcartra. He is from a world's record daughter of King of the Pontiacs and sired by King Segis Pontiac.

A SON OF KING SEGIS and the world's champion producer, Pontiac Clothilde DeKol 2d, 37 lbs. in 7 days and 1,271 lbs. in a year.

TRACING, AS HE DOES, four times to Pontiac Korndyke, through two 37-lb. daughters, through King of the Pontiacs, his greatest son, and Korndyke Pontiac Pet, a 37-lb. son, Uneeda King Alcartra Pontiac has every reason to be a great sire.

$600 BUYS HIM DELIVERED to any point in the U. S. If he does not suit you as an individual, send him back at our expense.

FEDERAL TUBERCULIN TESTED and guaranteed sound in every way.

The E. C. Schroeder Farms, Moorhead, Minn.

The Winship Farm Bulls

Are From Persistent Milking Dams

The 18 cows milking in my herd during April averaged 960 lbs. milk per day and 52 lbs. butterfat, each, for the month. This included heifers milking since last September, October and November. These dams represent the best blood lines of the Creamelle, Johanna, Beets, and Ormsby families.

Sired by Aaggie Burke Cornucopia De Kol

A 29-lb. bull, who traces back directly to the two greatest foundation cows of the breed, Spring Brook Burke and Aaggie Cornucopia Pauline. He is also closely related to the two champion 31,000-lb. milk cows.

Do you want a Pontiac in your herd?

PONTIAC STATE HOSPITAL, Pontiac, Mich.

Increase your Herd

HUMANITY calls upon you, the dairymen of America, to keep more cows. Millions of milch cows have been killed since 1914. Milk famine is near. Milk has never been so high priced or so scarce as now.

We have heard so much about wheat that we have almost lost sight of the fact that after all milk is the most necessary of human foods. Many dairymen want to keep more cows but have not done so on account of labor problems. To thousands of such men, the Perfection Milker has come and has opened the door wide to larger herds and bigger profits.

Bettinelli Brothers of Petaluma, California, report that two men with two Perfection Double Unit Milkers are now milking 82 cows in less than two hours. Geo. W. Sisson, Jr., of Potsdam, New York, tells us that with his Perfection Milkers one man and a helper are milking 50 cows, taking the place of 5 hand milkers. Think of the time and labor these dairymen are saving. Were it not for their Perfection Milkers, the labor shortage would have forced them to reduce their herds.

The Safe, Natural Milker

The Perfection Milker is safe because it milks like the calf with a gentle suction, downward squeeze and a period of complete release. Cows like it because it milks Nature's Way. It can be adjusted to give the exact action best for each cow. Its safe, natural method of milking has made it the choice of careful dairymen everywhere.

Simple and Durable

The Perfection Milker is so simple and easy to operate that boys and girls everywhere are handling them and take enjoyment in the work. Every part of the Perfection is the best that specialists using the highest grade materials and machinery can produce. We back every Perfection with our ironclad guarantee.

"What The Dairyman Wants to Know"—Free

Every question you want to ask about milking machines is answered in our great book, "What The Dairyman Wants to Know." Get it and study it. Write today for your free copy, together with names of Perfection owners near you. Write now.

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LVI FORT ATKINSON, WIS., JANUARY 17, 1919. Number 26

terstate Milk Producers' Association

Its Work Reviewed by President F. P. Willits

E market situation last January ınd February, as a result of condi- s largely national and therefore ɔnd our control, was such that it necessary for all the interests in ladelphia to co-operate to handle temporary surplus that accumu- d within the Philadelphia terri- '. The details of the trouble can- be given today for lack of time, I want to give full credit to the ıufacturers, dealers, and particu- y to the Pennsyl- ia Food Adminis- ion for the part it ed. Condenseries e helped to procure plies so that they ld handle extra . The association loyed Miss Ellen S. nton who was at- ıed to the Food Ad- istration and was active speaker in campaign which has vinced Philadelphia sumers of the food ıe and relative apness of milk as ıpared with other mal foods. The ladelphia dealers tributed generously advertising expen- Printed leaflets e distributed broad- t through the ools and at food servation meetings booths. As a re- , Philadelphia has eased its consump- ı in the face of the e increases which e been the inevita- result of war-time ditions.

hose in charge of duction interests e done much to im- ve conditions both in Pennsylvania in Washington. Never before e the problems of the American ner so well appreciated nor has e been such a promising effort to e them. I say this advisedly, wing full well that many re- ns we have in mind do not n to be near solution. But have in the National Board of m Advisors, of which Mr. C. J. on, Adams County, is a member, ehicle through which we make our ds known. The policy of carefully ecting the dealers' books and inating unsound business prac- s has enabled the dealers to sell for 14c per quart as compared with 17c in New York and Baltimore, though as you know our price has averaged on a par. It is hard to estimate the great advantage to the Philadelphia producers of this low retail price. As an example of the improved conditions, I might add that the Philadelphia dealers have voluntarily agreed to so concentrate their routes that one man and one horse serve as much milk as was commonly delivered by two men and two horses ten years ago in this city or even now in many neighboring cities.

DAIRY BARN AND TWIN BRICK SILOS ON FARM OF E. H. TURNER, WISCONSIN

Cost of Production Discussion

Through economic pressure the number of dealers in Philadelphia is steadily decreasing and the association is endeavoring to protect its members from financial loss through the failure of the less competent or energetic to survive. We are refusing to deal with a number of buyers whose financial standing or business practices are not such as satisfy the executive committee.

Throughout the past year Philadelphia price has been fixed through a discussion of its market value. At the price conferences the questions discussed have been those of market outlets, surplus, and manufacturing prospects with a never failing care to keep closely within the year to average production costs as estimated by Pearson, Warren, our own Professor Rasmussen, and other recognized authorities. A chief effort has been to protect the market so that the old law of supply and demand may not fail to operate freely and naturally. We are much interested in the efforts elsewhere to fix the price from month to month according to one or another formula covering the various items which represent the cost of production. Until we are assured that we can have governmental guarantees beyond those which are possible at the present time, the directors do not consider it wise that one of these methods be applied in Philadelphia district. As to the results elsewhere it is too early to get an opinion from those who have agreed to try it out. However, it would seem to us that it is far easier to discuss the value of milk than to haggle over the items of corn, feed, hay, and labor, knowing all the time that, after all, you are particularly concerned with the price of milk. Then, too, our association fears that in times of surplus it may be difficult, temporarily, to get even production costs and, vice versa, the formula could readily tie us down below the market value of our product when the market was improved again.

Organization and the National Association

Your association has last year joined the National Federation of Milk Producers and your officers have found it extremely helpful to attend its meetings both at Chicago and Washington, there to compare notes with those from all over the United States and to share in its efforts to improve the national situation, especially in regard to exports and to government purchases. Its president, Mr. Campbell, has been tireless in his efforts to promote our interests and Mr. Charles A. Lyman, secretary of National Board of Farm Organizations, has recently accepted the position of assistant secretary, giving part of his time so that the federation may always have a representative in Washington. When the organization idea was started it was the expectation that farmers in each section would organize comparatively independent groups which could be able to secure results independently of each other and of that large body of unorganized producers. Experience has shown, first, that it was necessary to combine in groups which represented roughly each of the primary markets in the country. Next we found that we were being hampered in our efforts because our manufacturers were selling their product in competition with others who bought it throughout large sections of the middle west at a price which was far below our cost of production.

The recognition of this fact has forced the National Federation to renewed effort to stir up a desire for organization in every dairy section of the land. There is no more important question to bring to your attention today and I want every man here to go home and get his neighbors

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The One Big Wish

The making of the shot and shell
Has ceased, and that it should, is well.
No more the booming of the gun
Is heard abroad, from sun to sun.

Mad scrambles, that the war be won,
Is gladly passed—and through—and done.
The camp and cantonment now will fade
Into a place where plows are made.

But, one thing war gave us, we hope
Will linger, broaden in its scope.
Please let us have—for seasons yet,
The blithesome, charming farmerette.

The Fable of the Indifferent Man

Once upon a time there was a tiller of the soil who believed in the line of least resistance. "What's the use of worrying over things?" was one of his pet mottoes. And that led him to neglect his machinery—no matter what it happened to be—from a harrow to a tractor, he was apt to leave it exposed to the weather. "Rust will get into 'em," warned a friend. "I'll cover 'em up tomorrow," was the inevitable answer. But tomorrow never came with this man. When spring came, rust had eaten him out of house and home. For the machinery was ruined. Moral: "A Shed in Time Saves Nine".

The Fable of the False Economist

Once upon a time there was a dairy farmer who would not be convinced that buying the best was economy. Money came hard with him and he didn't like to part with it in chunks. If he purchased a cream separator, it was the cheapest; if he bought cattle, it was cheap cattle; if he bought farm machinery, it was the cheapest he could locate. He ran this system straight through his establishment from his barns to his house. He even stinted his land when it came to fertilizer. And after five years in business, he made no money for the very simple reason that you can get the best only out of the best. His product was cheap and he got cheap prices for it. Moral: "Success never has been built on medium good."

The Fable of the Jolly Smile

Once upon a time there was a dairyman and his neighbors called him "Smiling Jim". No matter what happened, he'd grin. The day two of his finest Holsteins got out and were run over by a train, he just smiled and reckoned that he'd patch up his fences. But the neighbors, while they liked the smile, were forever saying: "He doesn't take the dairy business seriously enough. He won't make a go of it. He even smiles at his herd."

It so transpired, however, that the smile began to work. It made him liked about his own place and with his own help. It won with the wholesaler and the retailer. The folks at the bank in town liked him because he smiled. And he's the richest man in his county today. Moral: "Say what you will, honey catches 'em when vinegar won't."

The Fable of the Stay-at-homes

Once upon a time there was a dairy farmer with five fine sons. As fast as those youngsters grew to be old enough to tell the difference between a whiffle-tree and a tractor, he would give them responsibilities. At ten, one boy had a pair of calves that he fed and housed and watched to maturity. The next boy drove over to town twice a day with dairy products and was blessed with a little bank account of his own, and the third had a herd of four Jerseys. So it went, all up and down the boy line. They were kept so busy that they never thought of running off to the big city to seek another kind of employment. Moral: "You can do anything with a boy if you let him feel that he amounts to something around the place."

The Fable of the Labor Question

Once upon a time there was a farm, in the midst of many other farms, and this place seemed to have no trouble in securing help. The men would go there and stick. It was considerable of a mystery, for every other farm suffered from the comings and goings of workers. A shrewd farmer down the road a bit stopped one of the dairy hands on the turn-pike one afternoon and said: "What makes you like that place so much? How is it that Smith keeps his help? His farm isn't as good as mine and his herd isn't half the size. Explain it." "Simple," was the response, "never since I was born did I get such good cooking. The lady up there makes wonderful pies." Moral: "A man will make any sort of sacrifice, if he's fed well."

The Fable of the Business System

Once upon a time a dairy farmer had all the county guessing as to how he happened to make such a wonderful business success. "He gets better prices," said one. "His herd is all prize-winning cattle," suggested another. "He has modern equipment," hinted a third. "He was left money and banks every cent," was another comment.

But the old man shook his head when they rounded him up at a cattle breeders' convention and put the question to him squarely. If I'm successful," said he, "it's because I keep books. I know what things cost and what I get fer 'em." Moral: "Plain arithmetic is as important as cattle and equipment."

DE LAVAL

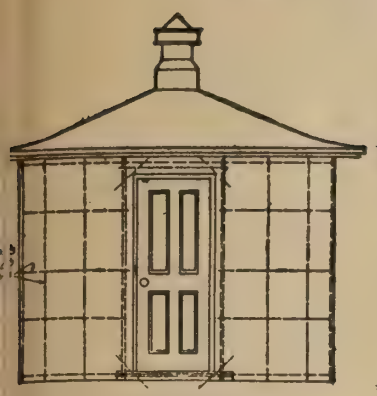
The World's Standard CREAM SEPARATOR

What does that mean to you?

It means that all over the world men who have had experience with separators and who pay little attention to "claims" and a great deal to "performance" have set up the De Laval in their minds as the "standard" cream separator—the machine embodying the highest type of separator construction and rendering the best service to the user.

It means that the De Laval has more attempted "copies" than any other machine. No "makeshift" copy of De Laval construction or design, however, has ever been able to copy De Laval efficiency or to give De Laval service and satisfaction.

It means that if you buy a De Laval you will get a machine that will give you genuine service. That you will get the cleanest skimming, easiest turning, longest wearing cream separator that money can buy.



Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

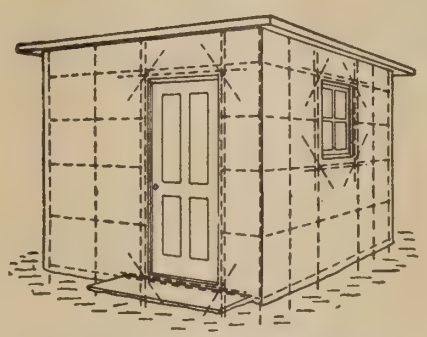
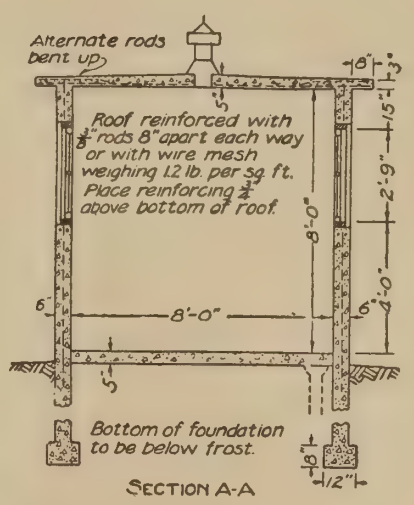
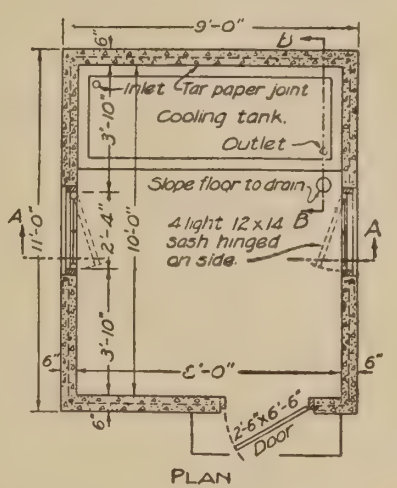
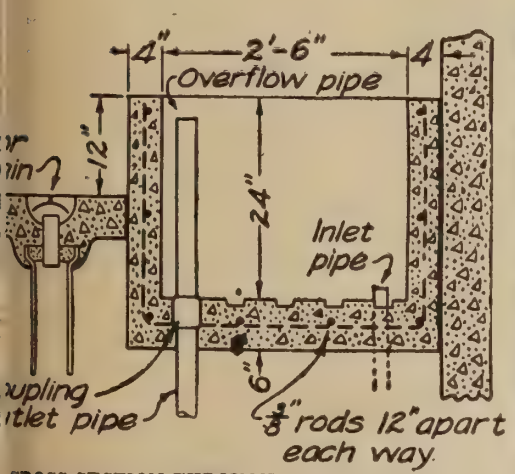
CONCRETE MILK HOUSES

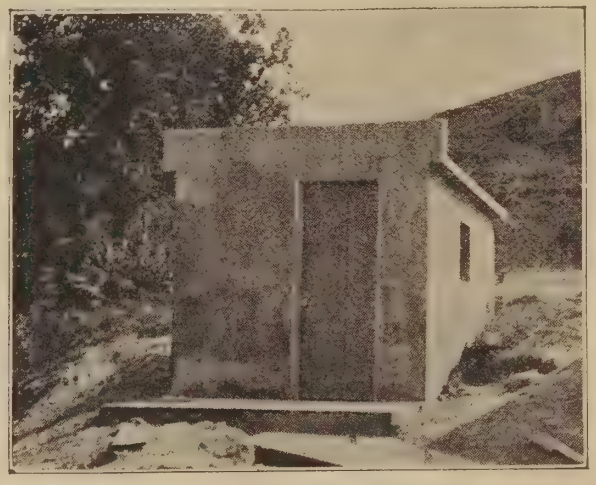




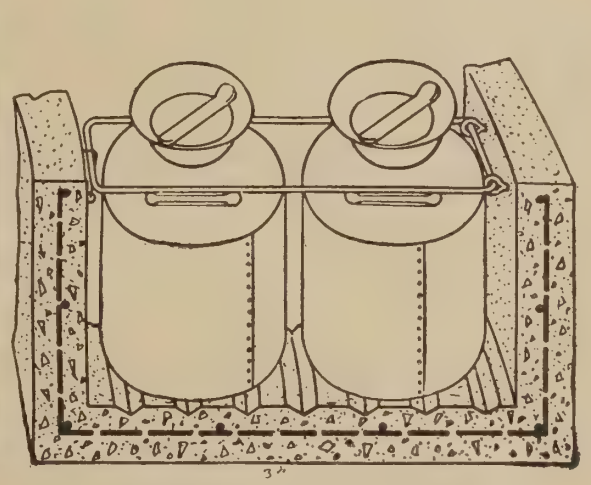




ALTERNATE FLOOR PLAN CIRCULAR MILK HOUSE



Wall reinforced with ⅜" round rods as shown. Rods doubled around openings and continuous around corners. Diagonal rods 2'-6" long at corners of openings.



CROSS SECTION THROUGH COOLING TANK SHOWING METHOD OF CONSTRUCTION

THE COMPLETED MILK HOUSE

DEVICE TO HOLD CANS IN WATER

plans reproduced above illustrate the building of a monolithic concrete lk house, the circular form that is now coming into favor being shown also the well established rectangular form. While these houses are pri- designed to meet the needs of the farmer producing milk for sale as milk, they may readily be adapted to suit the necessity of those produc- eam. They are large enough to permit the placing of a separator and necessary equipment, but it would perhaps be desirable to reduce the f the cooling tank that more frequent change of water may be secured, ally where reliance is placed on pumping water. Where a gasoline en- s used for power it will be desirable to add a small room to accommodate his can most conveniently be done in the case of the rectangular form, g this room with a separate entrance and with no opening into the milk proper except for the shaft or belt that is to transmit power to the sep- .

se houses are purposely designed to enclose a small area, both to reduce se and also in order not to leave spare room sufficient to encourage the g of farm implements or other odds and ends that would soon litter up ace and prevent it from being kept clean and sanitary.

cooling tank is the important feature of a milk house and it should be due consideration. It often happens that the tank is too large or too to cool the milk produced on the particular farm. Because the quantity k produced varies from year to year and from time to time, it is desira- many cases, to divide the tank into two parts, the larger having about the capacity of the smaller. The United States Dairy Division recom- that a cooling tank shall have a capacity of four gallons of water for gallon of milk.

height of the cans will govern the depth of the tank and also the length overflow pipe. The water should come well up on the neck of the milk order to properly cool its contents. A regular supply of ice will be found desirable where milk is to be hauled or shipped long distances, but this does not seem practical running spring water or water pumped a well will serve fairly well, but this water should be piped well under- d to keep it cool. Provision should be made that the water enters at the n of the tank and leaves at the top in order to secure its maximum cool- ing effect. The overflow pipe or outlet should be at least twice as large as the inlet, as the water enters under pressure and the tank will overflow if such provision is not made.

A number of grooves are formed in the bottom of the cooling tank so water can circulate under the cans. These grooves are made by placing wooden strips into the concrete of the floor before it has hardened; afterward the strips are removed. To lighten the labor of setting cans in and removing them from the tank, it is built partly below floor level. For the same reason the width of the tank is limited to the diameter of two cans, or to arm's length.

A device for holding cans down in the water when they are not heavy enough to settle under their own weight and rest on the tank floor, is shown in the detailed sketch. Dairymen who have had cans of milk and cream over- turned, allowing the milk to spill out or the water to run in, will appreciate this convenience. Where the cooling tank is already built, this same arrange- ment may be used. The rectangular device may preferably be made out of half inch galvanized pipe which is stronger and better than a solid iron rod bent into this form. The eyebolts to hold the device should be placed about 21 inches from the bottom of the tank, depending on the style of can used.

Provision should be made for a drain which will carry off the wash water from the milk house floor as it will not only aid in keeping the house clean but will also make the work much easier. Also the cooling tank should have an outlet at the bottom in order to make the cleaning of the tank convenient. In the detailed sketch this is provided for by unscrewing the overflow pipe from the coupling shown at the bottom of the tank.

The circular milk house may readily be built by using tank or silo forms. For the one shown above the following materials are required: 15¼ barrels cement, 5½ cubic yards sand, 8 cubic yards pebbles or broken stone, and 805 lineal feet of three-eighths inch diameter round steel reinforcing rods. The mixture for the walls and foundation of this type of milk house should be 1:2½:4, with a 1:2:3 mixture for the roof, floor, and tank.

For the rectangular milk house, it will require 15½ barrels of cement, 5⅔ cubic yards sand, 9 cubic yards of pebbles or broken stone, and 975 lineal feet of three-eighths inch diameter round steel reinforcing rods. The mixture for foundation should be 1:3:5; for walls above ground, 1:2½:4; and for roof, tank, and floor, 1:2:3.

SHARE LEASES FOR DAIRY FARMS

JOHN D. BLACK, Minnesota College of Agriculture

ON dairy farms in the north central states, two types of leases are in common use, namely, the half-and-half dairy lease, and the landlord's cattle dairy lease. With the half-and-half dairy lease, the landlord and the tenant each own half of the productive live stock, the tenant furnishes the machinery and the horses, and the receipts and increase in live stock are divided half and half. With the landlord's cattle dairy lease, the landlord furnishes the productive live stock—young stock being included with parent stock in many cases—and the tenant furnishes machinery and horses, and the receipts and increase are divided half and half as above. The landlord's cattle dairy lease is used under three circumstances, as follows:

1. Where the land is not very valuable and tenants are scarce or unable to furnish half of the dairy herd.
2. On family farms where the father turns over the farm herd to his son or son-in-law.
3. Where the landlord has a pure-bred or high-producing herd which he does not wish broken up at the end of each lease.

The first of these conditions occurs in the upper two-thirds of Wisconsin, Minnesota, and Michigan, and it is here that most of the landlord's cattle dairy leases are found. South of this region, the half-and-half dairy leases are by far the most common.

What Constitutes a Lease

The accompanying is a carefully drawn half-and-half dairy lease of the sort that is used on the ordinary dairy farms in Southern Wisconsin and Northern Illinois, but there are several important details which are not in accordance with high-quality dairy farming.

The first thing to note about the lease is that it is a genuine "lease", not an "agreement to work land", which is the form most lawyers use at the present time. An agreement to work land does not use the terms "landlord" and "tenant", or does it use the words "does hereby lease". Instead, it speaks of the parties of the first and second part. The party of the second part agrees to furnish machinery, horses, and part of the cattle, and pay certain expenses, and when he has performed all these things, the party of the first part pays him as wages half the proceeds and increase. The crops and increase belong to the owner of the farm until they are divided. The lawyers have devised this sort of an agreement in the hope that it would take the place of a crop lien. A lease such as the above is in most respects a partnership agreement. The legal part of a farm lease, however, is ordinarily a matter of only slight concern. The important thing is to have a clear understanding between the two parties as to all the terms of the agreement. Only by putting everything down in writing can the two parties be sure that they do understand each other.

This particular lease specifies a certain amount of labor which the tenant is to furnish. This is to provide for those tenants who sometimes try to get along with less help than is needed if the crops and the live stock are to be properly cared for. Other landlords handle this matter by paying part of the wages of an additional man, or by hiring an extra man during the busiest part of the season, or perhaps by going out to the farm themselves for a few days now and then. The landlords find that it pays them to do such things. Tenant often can not afford to hire extra

FORM OF LEASE

THIS AGREEMENT, made the first day of December, 1918, between———— of the County of————State of————, hereinafter called the landlord, and ———— of ———— Township of the same county and state, hereinafter called the tenant, WITNESSETH: That the said landlord does hereby lease to said tenant his farm of 160 acres, known as the McGowan farm, located in ———— Township of the county and state above named, together with all buildings and improvements upon it.

TO HOLD the same for a term of one year from March 1st, 1919, and thereafter for four more years unless notice is given by either party in writing to the contrary before December 1st preceding, and thereafter from year to year unless notice be given as above described, upon the following terms and conditions:

Sec. 1. Said landlord agrees:

1. To furnish to said tenant the above described farm and premises, put all buildings in repair at the beginning of the lease, and thereafter keep same in repair, except as hereinafter provided.
2. To furnish all material for building and repairing fences and pay for all the labor of building all permanent line and field fences.
3. To pay for man labor expended in ditching and in clearing land of brush, trees, stumps, and stone, except as mentioned in Section II.
4. To build during the summer of 1918 a new hen house large enough to keep 100 hens.

Sec. II. Said tenant agrees:

1. To farm said farm in a creditable and workmanlike manner, properly caring for all crops and all live stock upon it.
2. To furnish the labor for the above, the same to consist of not less than the continuous labor of two men from the beginning of the field work to the close of corn harvest, and such other labor as is needed.
3. To furnish all necessary horses, machinery, and tools.
4. To haul all produce to market.
5. To haul all feed and fertilizer and fence and building material.
6. To keep the manure hauled out, cleaning up the premises in the spring and fall of the year.
7. To make all ordinary repairs on buildings, especially to doors and windows, said landlord supplying all materials therefor except window glass.
8. To keep all fences in repair and build all temporary fences.
9. To cut and destroy all noxious weeds in time to prevent their going to seed, handle quack grass in such a manner as not to spread it, and take all reasonable care to keep the fields from gullying.

Sec. III. It is further agreed that:

1. Said landlord and said tenant shall each furnish on March 1st, 1919, an equal number of milch cows, heifers, brood sows, and chickens, and these together with the herd bull, which shall be a registered ———, shall be owned in common and in equal and undivided shares. It is agreed that said herd shall contain not less than twenty-four milch cows.
2. Each party shall pay one-half of the bills (except labor) for threshing, silage cutting, shredding, feed grinding, twine, feed, and fertilizer, and veterinary services (except for horses).
3. Each party shall furnish half the seed grain and grass and clover seed, except that on the last year that said tenant works said farm, the landlord shall pay for all grass and clover seed.
4. Said tenant shall have undivided feed for his horses, but he shall keep not to exceed five horses, raise no colts without the consent of said landlord, pay all horse shoeing and horse veterinary bills, make no charge to said landlord for horse labor, and if it is decided to raise colts, the tenant shall furnish the mare, said landlord shall pay the stallion fees, and the colt shall be owned jointly.
5. Said landlord shall pay all taxes on property jointly owned, but the tenant shall work or pay the road taxes assessed to the farm.
6. Said tenant shall lease no additional land without the consent of said landlord, but if it is agreed to lease such land, said landlord shall pay all the rent for crop land and half the rent for pasture land.
7. Said tenant shall build fences for said landlord, ditch, clear land, dig or otherwise destroy Canada thistles, if he has time to spare from the regular work of the farm, at such times as said landlord shall request, and shall receive pay for the same at the regular daily wages.
8. Said tenant shall board all workmen hired by said landlord at four dollars a week.

Sec. IV. It is further agreed that:

1. In general the fields shall be worked on a four-year rotation, consisting of corn, small grain, clover and timothy, and pasture. Clover and timothy shall be sown with all small grain, but this plan may be changed at any time by agreement between the two parties if possible, or if such agreement is not possible, at the direction of the landlord.
2. Said tenant shall neither buy nor sell property owned or to be jointly owned without the consent of the landlord.
3. Said tenant shall not breed any heifers till they are twenty months old, shall be responsible for all injury to animals due to their getting out through gates or unrepaired fences, and shall keep all cattle off the pasture and field while the ground is soft, especially in the spring.

Sec. V. The proceeds of said farm shall be divided as follows:

1. All crops and live stock products and the increase of all live stock shall belong half to each party, and said tenant shall pay one-half the proceeds from the sale of same to said landlord immediately upon the receipt of same, except that—
2. After deducting a charge for hauling, if there be such a charge, the buyer of the milk or cream of said farm shall make out equal checks to said landlord and tenant.
3. Said tenant shall first have not to exceed three quarts of milk for

Special Dairy Provisions

Even such a lease as the accompanying is hardly adequate to cover many circumstances that arise in dairy farming. The biggest difficulty is with making up the herd. The dairy lease provides that each party to furnish half of the cows. Often times the two halves of the herd are of a very different quality. It is unfair to match high producers with pure-breds against low producers or scrubs. It is value and not number that should be equal. Following are two provisions such as are sometimes found in dairy leases:

"A board of three appraisers, one chosen by the landlord, another by the tenant, and the third by the first two chosen, shall appraise the parts of the dairy herd furnished by the landlord and tenant, and the party whose share of the herd is less valuable shall pay the other party one-half of the difference between the values of the two parts of the herd; and thereafter the herd shall be owned jointly and in common." Or:

"Said landlord and tenant shall agree upon the value of the herd furnished by each, and whichever party has the less valuable herd shall pay the other party one-half of the difference or buy sufficient cattle at a price agreed upon by both landlord and tenant to make the shares equal and thereafter the herd shall be owned jointly and in common."

But the difficulties are by no means all overcome by the equalizing of the two herds. One of the questionable landlords in the dairy sections are forever asking is, "How can I build up a good herd if I have to provide it with every tenant who lives on my farm." Some of these landlords want to keep pure-bred cattle on their farms. Others are interested only in developing high-producing herds. Each tenant who comes to the farm ordinarily brings a fresh team of grades and scrubs, and when he leaves, according to the usual terms of these leases, he takes his share not only of the progeny of the landlord's stock animals, but also of the better animals themselves. Also the continual mixing of the herd by this procedure is one of the things that spreads tuberculosis and abortion. Share tenants change about every three or four years on an average in the north central states.

Provisions Where Herd is Pur-b

Following are a few plans that are being tried now and then to overcome the foregoing difficulties, under the half-and-half dairy lease in Wisconsin, in Illinois, and in Minnesota:

First plan: The herd is owned in common and divided in the usual manner at the end of the lease, but the landlord carefully selects a tenant who has a herd which he thinks will combine with his to no disadvantage. The difficulty with this plan is of course that a landlord who has a pure-bred herd finds it hard to procure a tenant who can match it. But if the farm herd of the ordinary sort there will be no difficulty of this nature in the better dairy sections.

Second plan: The landlord sells a half share in his herd to the tenant and thereafter the herd is owned in common. In some cases the lease allows the landlord to buy back the tenant's share of the herd at the end of the lease at a price determined by appraisal. However, few tenants accept such an arrangement. The chance to build up a good herd on the foundation of the landlord's herd is one

ings that makes them accept the of the usual share contract, and this chance away and many of will not be share tenants. In cases the herd is divided in the way at the end of the lease. means that the tenant gets part landlord's original herd as well t of the young stock. From the oint of the landlord, it is equiv- to selling off half his herd, qual- well as quantity, every three or years. It takes a long time to up a herd at this rate.

rd plan: Landlord and tenant heir herds separately, and the al stock, or so much of it as is ft, is retained by each party at f the lease. This makes it possi- r the landlord to have pure-bred h grade cattle, although the ten- oes not. In some cases the dif- e in the value between the two is adjusted and the increase of stock is divided half and half in sual way. Under such an ar- ment, the two parties share on terms, and the tenant gets his or the extra care required by oreds in the extra value of his f the increase. In other cases, fference in value is not adjust- t the landlord has first choice of lf of the increase of pure-bred s at a certain age. roducing Milk for the City

n the farm business includes a ilk route or supplies milk to stributors, certain extra expen- s are necessary in the matter of ent and labor, and the tenant stly be asked to stand only one- f these. Following are clauses eases covering these points:

re are now on said farm one e engine for pumping water, ilk separator and engine for it, one milk cooler, and a ty of bottles and cans, and said d and tenant shall own these and in common, said tenant said landlord ———— dollars half interest in the same, one- f the purchase price of any of ne if replaced new, and selling

daily family use, but no butter.

4. Said tenant shall have eggs for family use, but no poultry.

5. Said tenant shall have the produce of the orchard and the garden on said farm.

6. Potatoes grown outside of said garden shall be divided half and half, and said tenant shall deliver the share belonging to said landlord at his house in ————.

7. Said tenant shall have sufficient firewood for family use from down and dead timber, and if there is not sufficient dead and down timber, he may cut live timber where said landlord shall direct.

Sec. VI. At the end of the lease the joint property shall be divided as follows:

1. Said tenant shall divide each class of live stock, as cows, yearlings, calves, hogs, chickens, etc., into two groups of each. In case the two groups cannot be made equal in value, as for example, where there is an odd number of animals, the difference in value shall be agreed upon before the choice is made.

2. All hay, grain, and fodder shall be divided by measurement and one-half left on the farm.

3. Said tenant shall leave all straw on the farm without compensation.

4. Said tenant shall leave twenty feet of silage in the small silo.

Sec. VII. If said lease be terminated on March 1st of any year by three months' notice as hereinbefore provided, said landlord shall reimburse said tenant for all grass and clover seed sown the preceding fall; also for all plowing done in the fall at the rate of two dollars per acre.

Sec. VIII. If said tenant shall fail to carry out any provisions of this lease, it shall be the right of the said landlord to enter upon and take possession of said premises and all the property jointly owned, and care for same till settlement can be made, which shall be done as nearly as possible according to the terms of this lease.

Sec. IX. If dispute shall arise over any of the settlements provided for in this lease, the matter shall be left to a board of three arbiters, one chosen by the landlord, another by the tenant, and the third by the two first chosen, and the decision of this board shall be binding on both landlord and tenant.

Sec. X. Said landlord hereby reserves the right of entrance upon said premises at all reasonable hours in order to work and make improvements as he shall deem expedient. Said tenant agrees to quit said farm peaceably at the end of the lease.

Witnesses ———— Signatures of Contracting Parties.

———— ————

———— ————

his interest to said landlord at the end of the lease at such a price as shall be agreed upon."

"Said tenant agrees to employ two hired men, one for eight months and one for twelve months, at regular prevailing wages which shall not be less than thirty-five dollars per month for the year, and forty dollars per month for the season, and said landlord agrees to pay twenty-five dollars per month toward the wages of the year hand, said twenty-five dollars being understood as one-half of the cash wage plus the value of the board furnished by the tenant. It is understood that the extra labor due to the operation of the milk route is approximately equal to the labor of one man."

Care of the Herd

Following are a number of provisions with respect to the care of the dairy herd. Such provisions are becoming increasingly common:

1. No heifer calf shall be sold for veal unless for good and sufficient reasons and with the consent of said landlord, and no heifer shall be bred till she is twenty-one months old.

2. All cows in milk shall be fed not less than one pound of grain for each four pounds of milk produced.

3. Not less than ten tons of bran or other boughten concentrates shall be fed to the cows in milk.

4. Said tenant shall weigh and record all milk from pure-bred cows.

5. Registry fees for all jointly owned live stock shall be borne half and half.

6. Provision may be made for the expenses of Advanced Registry, tuberculin test, and membership in cow testing associations. The tenant should expect to pay half of these whenever they concern animals in which he has joint ownership or when he owns half the cows tested.

Other Provisions

Share leases have usually provided that the tenant shall haul all the milk and cream to market, but nowadays when many of the creameries or condenseries and other buying agencies are doing the hauling and deducting their pay from the milk or cream checks, the tenants are frequently paying only half of the expenses of hauling, the charges for it being deducted before the check is divided between the landlord and tenant. The justification usually given is that after all it is only part compensation to the tenant for the constantly increasing labor connected with modern dairying.

Some of the newer leases include a provision covering commercial fertilizers, such as the following:

"Said landlord and tenant shall share equally the cost of any commercial fertilizer which they shall agree to buy, and said tenant shall haul and apply the same to the crops. If said tenant leaves said farm any time within four years after the application of ground rock phosphate or ground limestone, he shall be compensated therefor at the rate of one-fifth of his share of the original cost for every year less than the five that he remains on said farm."

Providing for unexhausted commercial fertilizer, however, is of less practical significance than providing compensation for unexhausted fertilizer bought in the form of commercial feed and concentrates. On dairy farms especially, most fertilizer is bought in the form of feed. In most parts of the Northwest, ten farmers buy feed to every one who buys fertilizer; but almost always the tenant is required to pay one-half of the cost of the feed, haul it from town, feed it, and receive in return one-half of the extra yield in milk, the fertilizer value of it going upon the landlord's land and to the next tenant. English leases allow this form of compensation. Several practical farmers have suggested three years as the proper period for which to allow this form of compensation under American conditions.

Landlord's Cattle Dairy Leases

One of the circumstances under which the landlord's cattle dairy lease is frequently used is where the landlord has a good herd of cattle which he does not wish to be broken up at the end of each lease. There are several different arrangements under which this may be done, as follows:

1. The landlord furnishes the parent stock only, and at the end of the lease the tenant returns the identical animals in the same condition, or as near as possible the same condition, as he received them. The new-born stock is divided half and half.

2. The landlord furnishes parent stock and young stock and tenant returns the same identical animals at end of lease. New-born stock is divided half and half.

3. The landlord furnishes parent stock, or both parent stock and young stock, and the tenant at the end of lease replaces out of the herd an undivided increase an equal number of animals of the same age, weight, and quality.

4. In a few cases the tenant replaces the stock sold out of his half of the half increase, the landlord's herd being thus kept at a constant number.

Obviously only the first two of these are suited to a pure-bred herd. The landlord with a pure-bred herd wants his identical animals returned. But in such cases he must stand the depreciation on his parent stock. When young stock are also furnished, however, there is considerable appreciation to offset the depreciation. The two latter plans make the tenant share in the depreciation.

A Problem in Crop Rotation

Mr. John Marshall of Illinois writes: "There are two important questions with which I am confronted: 1. Is it possible for me to work cut a crop rotation on 153-acre farm of which 120 is under cultivation? 2. Is a rotation consisting of clover and timothy pasture followed by three years of corn, followed by rye seeded to clover and timothy injurious or beneficial to the land? In addition to the above fields I have 12 acres of alfalfa and 10 additional acres which may be put in oats or other annual crop."

The rotation outlined by this correspondent is a good one, and there appears to be no reason why he should not be able to follow it successfully. It will be noted that this correspondent has corn in the same field three years in succession. While this is not desirable, it is probably the best that it is possible to do, and furnish the amount of corn needed by the farm. If the field is manured following the first year of corn, the land can doubtless be kept in a fair state of fertility. Doubtless the correspondent buys more or less concentrates for feeding his herd. This will add to the fertility. In order to maintain or increase the nitrogen content it will be desirable to plow under, now and then, a crop of clover, and if the soil is deficient in phosphorus, which it is apt to be even in dairy farming, this can be supplied by adding rock phosphate or fertilizers containing phosphorus.

This correspondent has outlined a very complete and satisfactory system of rotation, and if he will make an analysis of his soil he will be in position to know the deficiencies that exist at the present time, and be able to adjust his cropping and fertilizing operations so as to remedy any weakness.

It will be desirable for our correspondent to make an acidity test to see if his soil needs lime, and by supplying this can correct the acidity. He can retest once in three to five years.

We wish to commend the thorough and careful manner in which this correspondent has figured out his cropping system.

Wisconsin College of Agriculture.

Women as Agriculturists

G. L. McKAY, ILLINOIS

A TRADITION has grown up in America, to quite a large extent, that if any woman does any work outside of the house on a farm, the same is degrading. It is difficult to comprehend why such a feeling should exist. The sections of Europe that have made the greatest success in dairying are those where the women have taken a very active part in assisting to care for the dairy herds and have almost exclusively cared for the dairy products. Possibly one of the best demonstrations as to what women can do as agriculturists was given in England during the past two years, where over 300,000 women were working on

PLOWING THE SOD

farms. England, whose bull-dog courage and tenacity are one of the wonders of the world, is being fed by women. Their able bodied men went to war long ago, but the women have taken their places and England has raised more food this year, we are told, than they ever did in the history of the country.

Here, in Illinois, a training farm for women was established at Libertyville, largely through the influence of one brave little woman, Mrs. Tiffany Blake. This was made possible through the generosity of Mr. W. V. B Ames, who gave the women the use of a 200-acre farm for the period of the war. In addition to this he furnished farm machinery, 200 chickens, and 18 cows. The equipment for the dairy building was furnished by the Creamery Package Company and the A. H. Barber Creamery Supply Company of Chicago. W. W. Marsh of Waterloo, Iowa, furnished the gasoline engine, the De Laval Company of Chicago the separator, and the James Company of Fort Atkinson, Wisconsin, furnished stanchions free for equipping the barns.

Twelve hundred applications were received from women for farm work. Of this number 85 applicants were accepted; 48 girls stayed during the summer season and were trained in diversified farming. The students receiving instruction were of three classes: girls who took up the work as war service, women who owned small properties and wished to better equip themselves to operate them, and city women who were not satisfied with confinement of office work and city life and wished to equip themselves for self-support in some open air employment. Seventy-five per cent of the students were college women, fifteen per cent stenographers and bookkeepers, and ten per cent were women of the leisure class or homemakers. Many have accepted positions on farms.

The writer was agreeably surprised, when visiting the farm at Libertyville, to find that everything was kept in such an excellent manner. The girls were dressed in overalls, heavy boots, sleeves rolled up, and equipped for doing most any kind of farm work. They were healthy, possessing a ruddy complexion and a sparkle in the eye that denoted health and vigor. They had a habit, however, of imitating the boy or man by keeping their hands in their pockets when they were not engaged in some line of work. They seemed well versed in the technical part of farming. I was particularly interested in the dairy herd, some of the cows being very inferior animals. The young women kept a detailed record of the pounds of milk given and the fat produced by each cow. One young lady said to me that she thought it was a waste of time milking cows that gave two or three pounds of milk as against others that would give twenty. She urged me to try and get some of the breeders to put in a few good cows as this would have a tendency to encourage the girls to greater efforts along dairy lines. The writer took this matter up with

RETURNING HOME FROM CUTTING HAY

some of the breeders and am pleased to note that some of them have responded by sending in some excellent cows as representatives of their particular breeds. Through the efforts of Mr. Munn of St. Paul, good representative cows of the Jersey breed were sent to the farm. Mr. Meeker sent some excellent types of Holsteins.

These young women have learned to manage machinery and to run tractors. They have plowed between 70 and 80 acres with tractors. They have also plowed with walking plows. They have learned to manage horses. Since the first of May they have taken care of from 10 to 14 cows, milking them each day. They have taken care of poultry, killed, dressed, and dry picked them for market. They have learned to make cottage, Devonshire, and French cheeses, South Michigan and Kensington cheeses, and to make butter. They have harvested vegetables and put up about 3,000 cans in addition to drying great quantities. They set out 2,000 tomato plants and 5,000 cabbage plants. They have taken care of the crops. They had 70 acres of hay, 3 acres of alfalfa, 22 acres of corn, 11 acres of oats, 7 acres of barley, 2 acres of wheat, 3 acres of sweet corn, and 4 acres of potatoes. The girls have taken care of harvesting, silo filling, and during threshing time made an exchange of help between the different farmers and the training farm. They also harvested the crop for a neighboring farmer who was short of help and had sickness in the family.

The farm includes a 10-roomed house equipped for 45 students, contains a hot air furnace, hot and cold running water in the kitchen, bath room, shower baths, and cellar. There is now a new cement cow barn which is furnished with 36 James stanchions, calf pens, and bull pens. These stanchions were loaned, by the James Co., as long as it was used as a training farm.

A very competent young lady is in charge of the dairy work in the dairy building—a young woman who had received her training in Scotland and England.

Now that the war is over, the question naturally arises, should the farm be continued as a training farm for women? The writer is of the opinion that it should be and that it should be put under the management of the Illinois University, possibly the Extension Department. A farm separate as this is, from the University, would have a tendency to attract more women to that line of work than it would if it were connected directly with the University, as this would avoid any prejudice that might exist in a school against women pursuing this line of work. The writer well remembers, not so very many years ago, when students taking the agricultural course at colleges were looked down upon by others in the school as being rather inferior. It is possibly the most popular course that can be taken by young men at this time. A great many of our city boys go to the state schools and take up four years of agricultural work. Therefore, I believe that it would be a good thing in every state to establish a farm something similar to the one at Libertyville. It would tend to overcome the prejudice that exists against women helping out on the farm, especially with dairy work or other light work that is suitable for them to do.

The home is not made by fine buildings, but rather by co-operation and a love for the surroundings. As a poet aptly said, "Home is where the heart is". A satisfied wife is one of the greatest helps that a man can get in any line of business. There are a great many of our city women who would prefer rural homes to city life. Therefore, a farm such as is described furnishes an ideal training for women who prefer to equip themselves for this line of work. The fact that a large per cent of the girls taking this work are college women will have in itself a tendency to overcome the

---

hy Do They Hide Away?

ARD'S DAIRYMAN:—My son had eam hitched up to start for the ield. The days were getting and there was not time to do a deal of work after the chores done. I asked him if there was ing I could do to help out, and swered:

hy, father, old Red Wing did not down last night. I think she is due to bring in her calf. If you ime to go up into the pasture and f you could find her, it would I would not wonder if she would ng by the gulf somewhere."

I set out up the hillside hunting Red Wing, looking first where e indicated, by the side of the But she is not there and I push gher. How still it is up here! across the valley the sound of voices come to me, as they call eir horses tugging away at the work. But aside from these s, all is silence. Not even the flutter this way to break the of the still fall afternoon. Now hen, tired with my climbing, for assing of the years has left me "short of breath", I stop to ack at the beautiful scene below, rm houses, the creek lying like a f silver, the cattle nipping the here and there, and above all ue sky without a fleck of a cloud ht.

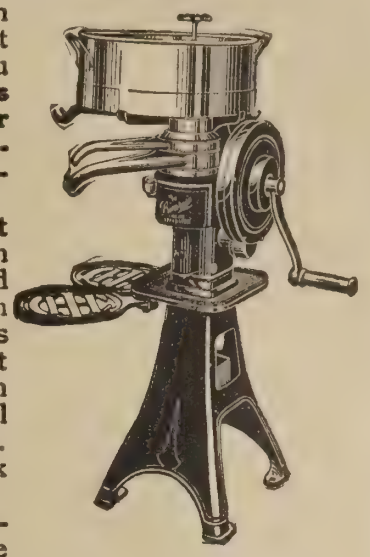
I wonder why it is that cows me like this, when nature is hav- way with them, are determined le away out of sight? It is so. hem a chance, and even if night ing on and the weather chill as y be, they will walk sometimes iles, hunting all along for the hat seems to them most favor- nd least likely to be discovered e eye of the master, and there will lie down to pass through avail of pain that has marked ming into the world of a new be- er since the beginning of time.

Only at one other time of life is this instinct so apparent, and we so-called civilized folks have, in great part, outgrown that. But even yet, there are Indian tribes which take their loved ones, after they have passed on to the spirit world, and journey away back out of sight behind the hills, and there in some quiet nook lay away all that is left of the beloved dust. In their first great happiness, as in their last mighty sorrow, these children of the wild seek to steal out of sight till the crisis is done.

But away up near the woods in a little hollow I find the cow with her calf lying snugged up by her side. Red Wing seems to see in me a friend and shows no sign of resentment that I have traced her to her hiding place; but the eyes of the calf are big with wonder as they look on this, the strange visitant of the new world into which it has come. For a little while I stand there and watch them. Then I rouse Red Wing, lift the calf to its feet, and we start on the long trip homeward. It is wellnigh a mile to the stable and the legs of the little fellow begin to wobble long before we reach the barn. But at last we reach the comfortable haven. I feed the cow and give her a drink of water, which she takes greedily. Then I put the calf around in front of her where she can see it and go away leaving them alone. But why did Red Wing hide away and make us so much trouble?

It is sometimes impossible to know just when the cow will bear her young. We may keep a record as accurately as we can, and watch as closely as we may. We will make a mistake. So it is our rule to keep the cow that is due to bear offspring in a stall or at least in a yard near the barn, even if this must be done a day or two; for there is some danger in allowing her to do as Red Wing did, and hide away if she is permitted to go out with the other cows. More than one good cow has gone away in this manner and never come back alive. If everything goes along as it should the danger is lessened. But the calf may not properly present itself. The cow may labor and struggle until she is tired out and die all alone. Or a storm may come up and the cow and calf be chilled, bringing on sickness that will be difficult to cure. We never have lost a cow that way, although I say it in no boasting way, and we are thankful for it. It may be this is because we have been luckier than some have been, for we have had a number of cows hide away to bear their young.

Saying nothing about the money loss when we lose a cow in this way, there is something about it that seems inhuman and calculated to make the farmer ashamed of himself that he has not taken better care of his cows. There are usually some signs that very fairly indicate the on-coming birth of the calf. Among these are the filling out of the udder and teats, as if nature were anticipating the needs of the little one, and often, perhaps I may say, usually, we may note a sinking in of the parts just at and by the side of the roots of the tail.



Then, too, many cows express in their eyes a sense of foreboding. A wild, anxious look may be observed there. Some cows seem to want human sympathy. They will turn to the master and call to him gently. I had one cow that never failed to let me know in such ways as these that she was approaching maternity. I knew when she called to me that way, and had that look in her eyes, that it was time to get her out of the stanchions and into the box stall.

If we watch and give attention to our cows, we will learn to read their feelings. Well for us if we act upon what we see and hear in our friends of the fur and the big heart.

New York. E. L. VINCENT.

Waste No Butter Fat!

IF YOU are still setting your milk and skimming by hand, you are losing anywhere from one-fourth to one-third of your cream. If you are using an old separator or one that is not reliable, you are still losing an amount of cream that would surprise you if you knew it. **Butter fat is worth too much this year to be wasted.** Buy a **Primrose** or **Lily** cream separator and stop the waste.

Don't imagine that cream left in the skim milk will fatten pigs and calves faster. It has been proved scores of times that stock thrives as fast on warm separator skim milk, when a little meal or flax replaces the fat. Cream in the skim milk is dead-loss cream!

Primrose and **Lily** separators get that cream. We can prove to you that they get it all, except about one drop in each gallon.

Besides that, they are well-known as simple, easy-running, easily-cleaned machines, that last and do the same good work year after year. Buy a **Primrose** or **Lily** and know the satisfaction of using a close-skimming machine. See the local dealers, or, write us for catalogues of these or any other machines in the list below.

Grind Your Feed

With the Williams Patent LITTLE GIANT GRINDER

The Little Giant Grinder will grind your Ear Corn (husk, cob and all), your Oats, Wheat, or any other grain, into either a fine, medium or coarse meal as desired. It will not merely crack these grains but will grind them into a real meal.

Equipped with genuine SKF ball bearings power requirements are reduced to the minimum. Four sizes give a wide range of capacity. Hundreds of farmers are using this machine, therefore, if you are anxious to save grain and reduce feeding costs investigate and install this machine. Bulletin No. 699 explains in detail.

ROCK ISLAND No. 38 One-Man TRACTOR DISC

Close-up levers permit one man to operate tractor and disc. Extra strong and flexible. No clogging.

No More Galls if You Use This Open-Throat Cotton Collar!

On over a million farms this cotton collar is being used in preference to leather. Not because they are cheaper or save leather for other needs, but because the Lankford Humane Collar means freedom from galls. Gall-afflicted horses work in them every day, and shoulders heal while in harness.

Made of closely woven army duck, like a surgical bandage. Stuffed with soft, springy cotton fiber that absorbs sweat and impurities from sores. Keeps neck dry and cool.

Made with an open throat that gives pulling muscles full play—moves with the pulling muscles, instead of chafing against them. Cannot sweeney. Will not pack or harden—often lasts three or more seasons.

Dealers sell them on the guarantee that galled horses get well while working in Lankfords. If your dealer cannot supply you, send us $2.50, and we will ship you a collar, charges prepaid. (7-2c)

The Dairy Farm Lease

AS a further contribution to Professor Black's discussion of farm leases we give below a copy of a lease, which, with a few changes, has been in satisfactory operation on a dairy farm for nearly twenty years.

Neither the accompanying lease nor the one suggested by Professor Black will meet every local condition, and it is doubtful whether either one should be followed in detail in any individual case. They are intended rather as a guide than as a "hard and fast" form. The best method of procedure is to understand clearly what is wanted by both parties to the lease, what peculiar local or personal conditions may prevail, what the law of the state may require, and what the custom of the community may demand as to the form of lease and the division of the responsibility and profit. After these have been determined, then have the lease drawn up by a competent person of the locality who is accustomed to the drawing of leases, in order that the desires of both parties may be put in proper legal form.

The value of a written lease lies in the fact that it will help to obviate misunderstanding should any discussion arise as to the requirements put upon either party. Should anything of this nature arise, then the lease may be consulted rather than the memory or understanding of either party to the lease. The best kind of a lease will not be satisfactory if either the tenant or the landlord is dishonest, lazy, or incompetent.

On farms where milk production is the major operation, such as in the Elgin dairy district, the first party frequently supplies all the productive live stock (or at least the cows) and still shares half and half with the tenant. In some cases instead of paying for one-half of all seed purchased and one-half of the threshing and silo filling expenses, the first party may furnish all the grass and clover or alfalfa seed he may wish to have used, while the tenant bears the entire expense of threshing and silo filling.

The provision in the following lease as to the use of fertilizers is somewhat unusual but we believe it is wise to incorporate this or at least make it provisional upon an agreement between both parties. Occasionally the first party agrees to pay all expenses for fertilizers and the tenant agrees to haul and apply the same, being allowed a certain compensation for unexhausted improvements.

Although general opinion has been to the contrary, it has been the experience of investigators that a lease for one year and providing for its continuance will prove more satisfactory than a lease for a definite long term. They have found that leases of the former character seem to give greater satisfaction, and tenants, in fact, occupy farms for a longer period under this form than under the other.

Without further comment the following lease is submitted:

Lease

Memorandum of Agreement between ———— of, ————, ————, lessor, party of the first part, and ———— of ————, ————, lessee, party of the second part:

The party of the first part leases to the party of the second part for the term of one year from and including the 1st day of ————, ——, the premises known as "————", situated in the town of ————, ———— and consisting of approximately —— acres. The first party also leases therewith his personal property as shall be determined by invoice and appraisal made and attached hereto on ——, ————.

It is mutually agreed that the general type of farming shall be dairy and that each party shall furnish one-half of all the productive live stock to be kept on the farm, which stock shall be held in common, jointly, undivided, and share and share alike except the necessary teams for work which are to be furnished by the tenant but are to be fed out of the undivided feed either produced on the farm or purchased.

It is also agreed to keep a pure-bred bull of the ———— breed at the head of the herd to be purchased and owned jointly, said bull to be mutually satisfactory to both parties; that the heifer calves from the best cows are to be raised each year so as to maintain or increase the size of the herd and improve its quality; that membership in a cow testing association shall be maintained, if one exists in the vicinity, the membership fees and pay of tester to be borne by first party, board and conveyance of tester to be furnished by second party.

It is also agreed that each party is to bear one-half the expense for binder twine, for machine hire, and fuel for threshing and silo filling, and one-half the expense for all seed, including grass seed, purchased.

Buying and selling of materials, live stock, and other farm products shall be left largely with second party but all sales or purchases of more than five dollars ($5.00) shall be made only with the knowledge and consent of first party.

No colts or other animals shall be raised except such as may be mutually agreed upon by both parties or more horses kept than necessary as agreed to by first party.

First party is to receive as rent and compensation one-half of the products raised on the above described property, (except fodder not grain fed to stock) one-half the increase in number and growth of live stock, one-half of the receipts for stock sold, one-half of the return from creamery or otherwise for milk and cream, one-half of the increase and products from poultry, and in general one-half of all gross products of the farm, or their sale value whether specifically mentioned herein or omitted.

First party agrees to pay the annual state, county, town, and school taxes; to furnish what new material may be required for building and repairing fences and exterior of buildings; to keep well and pump in repair; to keep barns and house in repair but does not bind himself to paint, decorate, or make other than absolutely necessary repairs; to purchase one-half of such fertilizer as may be mutually agreed with second party; to purchase one-half of such fertilizer as may be mutually agreed with second party; to purchase one-half of all the feed which it may be necessary or expedient to purchase for stock in addition to that grown on the farm; to pay stallion service charge for all colts raised on farm; to keep properly insured the dwelling house, barns, and other valuable buildings; and

The party of the second part takes and leases the said farm and personal property in accordance with the foregoing provisions and undertakes and agrees to make his occupation and use of the same as profitable to the owner as may be, and especially to take the best care of stock and other personal property and return same to lessor in as good condition as when received by him, ordinary aging and use and

by fire, floods, winds, or light-
g excepted; to carefully use, house,
care for all machinery, tools, im-
nents, and other personal proper-
owned by first party; to furnish all
hinery, implements, dairy appa-
us, labor, and team work neces-
y to carry on the farm in proper
ner; to work out or pay all high-
r taxes that may be assessed
inst the real or personal property,
to keep the roadsides free from
ds; to account for any pay for or
lace all hay and grain that may be
he farm when he takes possession;
that all fences are kept in reason-
e repair, and furnish labor for
h repair and to build new fences
necessary; leave all buildings in as
d condition as when surrendered
im, natural wear and damage by
elements excepted; not to dispose
ny straw, other forage, or manure
removal or sale without lessor's
sent; haul out and spread all ma-
e daily or as frequently as weath-
nd ordinary farm conditions will
mit; and carefully in all things
guard and promote the interests
he lessor as well as his own, with-
regard as to whether the particu-
items or matters are herein set
h or omitted.

he party of the second part furth-
grees that the lessor may at any
all times enter to view the prem-
and all parts thereof; that he will
respectful attention to the ad-
and suggestions of the lessor as
he management of the farm and
k; that as much land shall be left
ved when this lease shall terminate
was plowed when it commenced,
likewise as to amount of land in
er and alfalfa; that he will leave
farm and premises generally in
good or better condition than he
nd them; that he will deliver to
ket all stock and produce sold,
ver milk or cream to cheese fac-
, creamery, or otherwise as may
nutually agreed upon, and do such
ling of feed, fertilizer, building
erial, etc., as may be used on the
n; that he will cut down, and
cut so they will not mature seed
become a pest, all noxious weeds
ut the farm and in the fence rows;
he will fill and keep filled all
hes and clean ditches on the
n; that he will, on or before
ch 1st of each year, and as occa-
may render necessary, consult
the first party as to the crops to
rown, fields to be plowed, and the
eral rotation to be followed.

he second party shall have the
ilege of taking such reasonable
unts of milk, eggs, poultry, fruit,
toes, and other vegetables pro-
d on the farm as he may need for
ily use, but if there is any sur-
of the above products he shall de-
r one-half to the first party, or in
of sale the proceeds are to be
lly divided between both parties;
pt that no butter or cheese shall
made. In case any animals are
hered, the hides, meat, and other
ions shall be divided equally be-
n both parties, or such other ar-
gement made as may be mutually
eable. The second party may
for his use any dead and down
er on the place and such other
er as may be specially allowed
year by first party.

arty of the second part shall ap-
ground raw rock phosphate or
phosphate to approximately one-
of the cultivated land each year,
party bearing one-half the cost
he material used. He shall also
y ground limestone (or other
) to fields of acid soil that are to
eeded to alfalfa or clover, the ap-
tion to be made in such amounts
he condition of the soil may re-
e, each party bearing one-half the
of the material. For the purpose
his lease, it is estimated that the beneficial effects of the phosphate and lime will continue for five years, and the first party hereby agrees to reimburse second party one-fifth of his expense for purchased phosphate and lime for each year he has received no benefit owing to the termination of his occupancy of the farm.

The first party agrees to recompense second party for any unexhausted improvements which he may make during the term of this lease with the consent and approval of the first party. In case both parties fail to come to agreement as to the amount of recompense, then arbitrators shall be chosen in the manner hereinafter provided and their decision shall be final.

It is the intention of this lease to record the important points upon which the parties have agreed, but if anything has been omitted, upon which the parties cannot agree, or if there be any controversy as to the interpretation of the conditions and terms herein written, then such matters shall be submitted to a board of three arbitrators to be chosen, one by each party to the lease and the third by the two so chosen; both parties mutually agree to accept as final and abide by the decision of said board of arbitrators.

At the expiration of this lease (unless it shall be renewed) or if it be sooner terminated, the parties agree that all jointly owned property shall be disposed of to the best possible mutual advantage or divided in such manner as may be voluntarily agreed upon or as determined by a board of arbitrators as provided above.

This lease may be continued from year to year at the pleasure of the parties hereto, but may be terminated at the expiration of any year by either party giving to the other three months' notice in writing of his wish to have same end.

In witness thereof the parties have hereunto subscribed their names and affxed their seals this — day of ——— ———, ——.

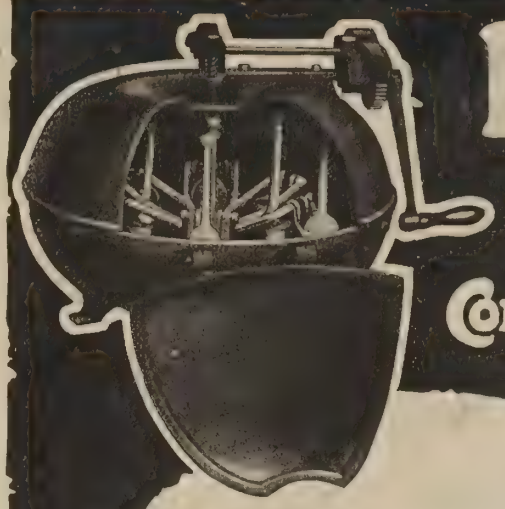
Dairy Manufacturers' Course



A dairy manufacturers' course will be offered at Ohio College of Agriculture at Columbus from February 3 to 28. This is to include a study of cream testing, city milk supply, dairy mechanics, and the production and manufacture of butter, cheese, ice cream, and special attention to dairy by-products.

A careful study will be made of milk, milk products, bacteriology, and the Babcock test. Practical work is to be afforded in the laboratories in making bacterial counts and propagating starter for the various milk products. Much attention will be given to the classification of milk and the methods of handling.

In the buttermaking classes the ripening of cream, the use of natural and artificial starter, testing, printing, packing, sale, and the handling of creamery accounts are to be treated.

Various factors entering into the manufacture of ice cream made according to different formulas will be studied both in the laboratories and the lecture room.

John Lengacher, a native of Switzerland and the proprietor of a Swiss cheese factory at Dundee, has been employed as special instructor for the cheese making course. Mr. Lengacher won gold medals at the National Dairy Show for the past two years and is vice-president of the Ohio Swiss Cheese Association.—Ohio College of Agriculture.

Babcock Milk Tester Complete $12.00

Any Cow Owner Can Make Accurate Milk Tests With the Efficient and Simple Crepaco Babcock Milk Tester

There is nothing intricate about it—operated by hand. There is a size for every dairy, from the 2 bottle tester to the large size with 24 bottle capacity.

This tester is noiseless in operation, the high speed being attained without unnecessary friction, by means of a spur and worm gear with cut teeth. The full instructions which are supplied with each machine tell you how to make accurate milk tests.

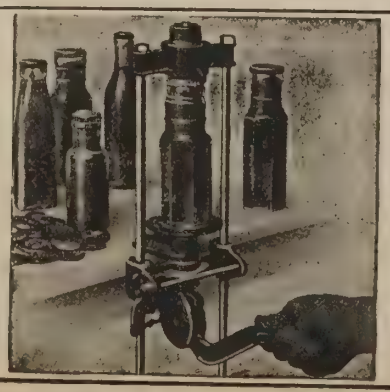
Crepaco Babcock Tester complete with glassware as illustrated above—six bottle capacity costs only $12.00.

We have Babcock Testers as small as the 2 bottle size costing $4.25 complete with glassware.

Our big Dairy Catalog describes fully, all size Milk Testers and other appliances of value to the dairyman. Write for it TODAY.

THE CREAMERY PACKAGE MANUFACTURING CO.
68 W. Kinzie Street, Chicago, Illinois

OUR GREATEST FOOD WASTE



Our greatest food waste, says the U. S. Dept. of Agriculture, "is through the *failure to utilize skimmed milk and buttermilk for human food.* These products have all the food value of whole milk except the fat."

Conserve needed food and increase your dairy profits by working up your "skim" and surplus milk. Market them as cottage cheese and buttermilk in the neat, appetizing KLEEN KUP—"The Package of Quality for Foods of Quality". Use Kleen Kup packages, too, for marketing fancy butter, cream, etc. They are attractive, non-breakable and inexpensive. Used by over 4,000 dairymen.

Look into this money-making proposition. Write us for Kleen Kup samples and the Kleen Kup story—*free.*

Newark, N. J.

A Better Way of Sealing Preserves, etc.

In putting up preserves, catsups, chow-chow, chili-sauce, berries, Indian Relish, etc., don't follow the troublesome paraffine wax method of closure.

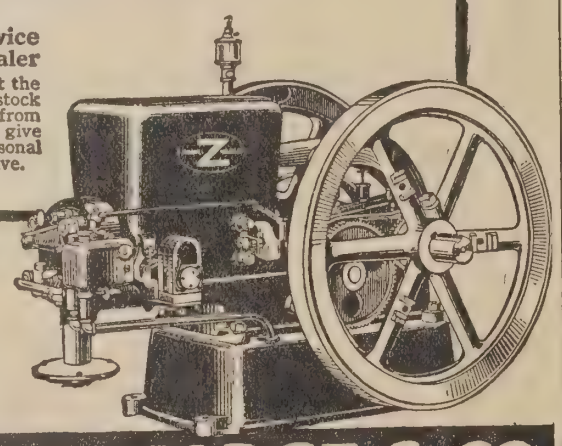
The better and easier way is to use a MIDGET CROWNER and seal your bottles (up to 14 ins. in height and 4 ins. in diameter) with air tight Crowns (3 sizes).

In storing condiments of all kinds for future use you will find this the safest method of sealing.

Write for full particulars.

THE CROWN CORK AND SEAL COMPANY
Baltimore, U. S. A.

The Engine Selected by over 150,000 Farmers



RECORDS made by over 150,000 practical farmers buying over $10,000,000 worth of Fairbanks-Morse "Z" Farm Engines have never been equaled in Engine history.

Demand, as they did:

1. Fairbanks-Morse Quality.
2. Economy in first and fuel cost, and low upkeep.
3. Simplicity and Staunch Durability.
4. Light-weight, Substantial, Fool-proof.
5. Gun-barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

You Also Get Service from your Local Dealer

Your local dealer has just the type "Z" for your needs in stock—waiting for you. Buy from him. He is prepared to give prompt delivery and personal service right where you live.

The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H.P. size uses gasoline only.

New Victory Milking Machine

embodies the best features of the best milkers, Human and Machines, without their faults. You know that it is natural for every maufacturer to claim that his machine is the best in the world, and with everybody claiming to make the best machine, it becomes a ticklish job to pick the right one. We are not making any claim we cannot back up. If we or our dealer cannot prove that the New Victory is the best suited to your needs, we cannot expect you to buy it. Our idea, therefore, was to build not only the best milker, with the most advantageous requirements, such as simplicity, durability, sanitation, low up-keep, easy installation, etc., but to so make and embody in it qualifications that will fill the requirements of the greatest number. We let the machine speak for itself. Let us send you our catalog.

STARCH BROTHERS COMPANY, LA CROSSE, WIS.

West Bend Automatic Stanchions equipped with our wonderful locking-releasing lever save you time and labor—and insure safety in locking up or releasing the cows, yet you pay no more for West Bend equipment than for ordinary stanchions that must be opened and closed singly by hand. The West Bend lever controls from 2 to 50 West Bend Automatic Swinging Stanchions. The entire row of cows can be locked up or released instantly by one throw of the lever. Cow stops are operated at same time, and when set guide cow into the stanchion. Every user says it's the greatest idea ever brought out in modern barn equipment. You certainly want this valuable new exclusive West Bend feature in *your* barn. Write today for catalog.

Bran Sky-rockets in Price

SANDERS SOSLAND, MISSOURI

NEVER before in the annals of American agricultural markets has there been so sharp an advance in a few hours as recently was witnessed in that period in the bran and shorts trade. Prices rose $25 to $30 a ton, and the space of time required for this remarkable advance may be figured in hours, if not minutes or seconds. No less remarkable is the fact that the supply, which before the advance offered only discouragement to the producer of dairy products, changed into an almost normal status following the spurt in prices. Veteran students of feed markets, men who have given their entire business life to the feed industry, live stock producers, and leaders in allied industries wondered at the remarkable change in the bran and shorts trade from an almost hopeless position to practically a normal state. Some even refused to accept the news as true, actually closing their doors, until having in their hands complete and correct information of developments.

In Kansas City, the flour milling center of the Southwest, bran is selling at $45 to $47.50 a ton, sacked, mixed feed $50, and shorts $55 to $60 a ton. These prices compare with the former government maximum fair price of $26 for bran, $27.50 for mixed feed, and $28 for shorts. The highest level ever scored on mill offals, recorded shortly before the United States Food Administration fixed prices in December, 1917, was $42 a ton on bran and $50 a ton on shorts. In Minneapolis, prevailing levels for bran are $44 to $45 a ton, sacked, compared with $28.40 a ton under the government schedule of prices. Shorts are selling at $50 to $59 at the northwestern market, against $29 to $30, the maximum price. Markets in other portions of the country report bran and shorts on a parity with the prices prevailing in Kansas City and Minneapolis.

Whether the dairy industry was blessed or injured is a question open to debate. Some dairymen call it victory, others look at the changed conditions from a gloomy viewpoint, while still others, possibly in the majority, maintain silence as to the ultimate effect of the peace-time development in the bran and shorts market on the dairy industry of America.

Suddenly, like a cloudburst or a tornado, utterly unexpected, news reached the milling and feedstuffs industry of the country and now is slowly leaking to the dairy interests and hog producers, of the action of the United States Food Administration at Washington, repealing all restrictions on the manufacture of flour and feed, rescinding all regulations as regards distribution, and most important of all, throwing off the yoke on the price restrictions. This, in a few words, summarizes sudden action by government food officials almost revolutionary in scope, which caused the violent price and supply changes in the bran and shorts trade.

The rescinding of regulations affecting the price and manufacture of flour and feed was as little expected by even the best informed members of the milling and feedstuffs industries as dairymen today are anticipating, reversely, action by the Hoover Food Administration demanding that producers of dairy food sell their milk at not less than 25 cents a quart, a price which, compared with the level of other food commodities, is not abnormal. The mill feed trade was immediately thrown into turmoil, chaos of a remarkable character prevailing, not having yet entirely subsided.

"Any bran for sale?" inquired a discouraged feed dealer of a Kans miller just before the startling ne became public. And a conversatio typical of any discussion of the su ject heard in the past year, followe

"Well," replied the miller, "if you take three-fourths of a car of flo I'll throw in a fourth of a car of bra give you the bran at $26.50 a to sacked. But don't expect this tre ment too often."

The dealer was delighted at the o fer of the miller and asked for an o tion of three hours before completi the transaction, which the miller l luctantly gave.

About an hour later the dealer r turned to the miller's office and co firmed the sale, beginning to gi shipping directions.

"Fifty dollars for bran, the m ket's gone up!" This was the inf mation conveyed by the miller to t feed buyer. The feed dealer d played surprise. "Fifty-dollar-br when the maximum price is twen six in straight cars—it's impossibl thought the dealer. But he was formed of the action by Washingt food officials. No, he did not rej the bran at the advanced price, l gave shipping directions immediate apparently fearing more sky-rock ing in the market.

The same is true of dairymen a hog producers, both classes are in e market, being almost as eager buy at the advanced price as at the for maximum fair price schedule. But e feeder of live stock, who purcha bran and shorts only because an tificially low price had been set on commodity, began to shun the f dealer and has returned to the fe used in normal periods. Of cou the advanced price of bran and sh makes the dairyman and hog fatte more conservative in the use of mill offals. Economy must be p ticed with the market at the pres level. These developments h brought about the greater avail supply on the markets of the cou and more even distribution in all tions.

Of course, some time must el before available supplies will be e to the demand, or at least until n mal conditions are again resto Numerous influences present th selves in forecasting the future de opments in the bran and shorts m kets, all of which seem to point, e at the advanced levels, to a shor of mill offals.

Flour Industry Outlook

The outlook for the flour mi industry of the country is far b bright today; in fact, it is doubtf members of the business ever be saw in the immediate future as pleasant a trade outlook as in present crop year. Numerous p scattered over the country have b down temporarily, many others a operating on half and one-third m schedules, while still others see a pect for only a short period of o tions ahead, and then, unless cha are soon forthcoming, inevitable down. Of course, with many plants in the country forced to pend operations, the supply of and shorts will naturally decrea volume.

A dull demand prevails for flo domestic markets. In the larger suming centers of the United St it is estimated that a supply of o equal to the needs of consumer sixty to ninety days is now held. would indicate little improveme the buying power of domestic kets for at least two months. flour milling industry has expand a stage where no great effort

ired to supply the domestic require-
er+; for the product of the bread
ain. What is needed by American
illers and what is vital to their wel-
re, as well as to the dairy interests
10 look to the miller for bran, is an
en export market for flour.

Flour Exported

Until a few weeks ago, the Food
lministration Grain Corporation,
e export flour buying department of
e United States government, made
avy purchases of flour from Ameri-
n plants for export consumption. It
estimated that approximately 8,-
0,000 barrels of flour were pur-
ased in about two months for ship-
nt to Europe, but in the past few
eks, no flour whatever has been
ken. Whether the absence of de-
nd for export flour will be perma-
nt is uncertain, for the activities of
s Grain Corporation are little
own to the industry. Since the
vement of 1918 wheat began to
w into terminal markets, the gov-
nment has been following a policy
inly of exporting wheat in the raw
rm, rather than as flour. There is a
ssibility that flour exports will be
sumed as soon as the alleged con-
stion at seaboard points is cleared.
The Northwestern spring wheat ter-
ory of the United States is far
re fortunately situated than the
nter wheat belt of the Southwest.
hile the winter wheat harvest was
bountiful as in the Northwest, or
re so, there is an acute shortage of
e bread grain in the winter wheat
rritory. In order to uphold its
aranteed price to the wheat farm-
, the Food Administration Grain
rporation was forced to buy huge
antities of wheat at the minimum
ice. With the golden grain rushing
market as never before, the gov-
nment wheat buyers soon accumu-
ed a huge stock, the greatest on
cord. Mills were hesitant in pur-
asing above their current needs,
ving a maximum price on flour
sed on the minimum price of wheat.
expense of two cents to two and
e-half cents a bushel accumulates
nthly on stored wheat, this includ-
g the carrying charges of one cent
bushel a month, in addition to the
erest, shrinkage, deterioration, and
ne factors which add to the ex-
nse of storage.

Mill Shortage

Flour millers permitted the Grain
rporation to take all the wheat re-
ived at terminal markets above
eir current purchases. Only in
ttered instances did mills make at-
npts to store wheat, flour manufac-
rers operating on the theory that
en their supplies became short, the
ain Corporation would gladly turn
er part of its huge stocks. But mill-
s have been sadly disappointed; the
ain Corporation has refused to re-
tribute to domestic consumers even
bushel of wheat and has announced
at it will not do so. Only a very
all quantity of wheat remains in
mers' hands in the Southwest, con-
quently the period for active milling
erations is short. Unless the gov-
ment reconsiders its position in the
eat trade, it is estimated by market
dents that 50 per cent of the mills
the Southwest will shut down
rch 1, with the remaining 50 per
t following in close succession.

At the moment, millers are clamor-
for hard and red winter wheat.
. 2 grade of the latter, with a guar-
eed minimum of $2.15 a bushel in
nsas City is selling at as high as
45, a premium of 30 cents a bush-
This is the highest price paid on
crop, notwithstanding a dull de-
nd for flour. Apparently it is the
limited price at which bran and
rts may sell that makes the miller
rry for his wheat supply.

The spring wheat country of the
rthwest, which begins to market its golden grain several months after the Southwest, has been able to witness developments in the winter wheat territory, and thereby safeguard its milling industry from any shortage. The Northwest is losing little time in accumulating a huge stock of wheat for its needs, making purchases from the standpoint of future trade requirements and giving no consideration to carrying charges. Wheat in the Northwest is practically at the government minimum, making it a simple matter for flour mills of that territory to sharply undersell southwestern plants.

There is hope that the Grain Corporation will soon redistribute its wheat, but millers have nothing upon which to base their optimism on this score, except possibly the fact that the government officials find it advantageous to the food interests of the world to change their opinions occasionally. Dairy cows, however, cannot subsist on hopes; in order to produce milk there must be bran, and the amount the northwestern millers can produce even with an export outlet for flour, which today is not forthcoming, is not great in the aggregate.

Aside from the fact that more bran and shorts are available since the repeal of the Food Administration restrictions on the manufacture and price of flour and feed, dairy interests can feel happy over the fact that changed conditions will result in the production of mill feeds with a much higher feeding value. At the time world wheat supplies were acutely short, food officials at Washington demanded of American millers that they clean their wheat better than previous to the war. This meant that fewer flour particles were allowed to remain in the bran, thereby reducing its feeding value. However, since the removal of restrictions, mills, in order to capture permanent trade, are improving the feeding quality of their offal feeds. Low grade flour, which has a very narrow outlet among the consuming trade today, is being thrown into the bran and shorts, which process is remunerative as long as the mill feeds maintain their present heights.

In returning to the manufacture of flour under the old regime, more bran and shorts are produced from each bushel of wheat. Under the federal restrictions, millers were required to operate on a 74 per cent extraction basis, which permitted the production of 68 pounds of bran and shorts per barrel of flour. Without the government supervision, mills will reduce the extraction basis, using upwards of 274 pounds of wheat per barrel of 196 pounds of flour. The addition of an average of eight pounds of offal per barrel of flour means a great increase in the supply when considered in the total production of the United States.

Uncertainty attaches to the flour situation, and a majority of millers of the country will continue on a 100 per cent standard flour basis until more of the future is known. Whether the government will resume its export flour trade, whether it will take the so-called "clear" and low grade flour which is produced along with the fancy patent grades, the outlet for which is limited principally to export, and whether government wheat is forthcoming, are among the questions yet to be answered before patent flour milling becomes general.

In announcing its sweeping changes to the trade, food officials made it plain that it would continue a "watchful eye" as regards profits of both millers and dealers. The fixed maximum profit schedules of dealers still are maintained, while millers' profits will not be allowed to become exorbitant through the monthly reports on transactions they are required to prepare for the Food Administration.

The A B C's of Dairying

The farsighted dairyman sees more than the milk in the pail—he sees the money in the milk. More milk means more money. But for him to get the full benefit of maximum milk production he must keep feed costs at a minimum.

He can best do this by replacing an entire grain ration with a mixture of his home grown grains and

INTERNATIONAL
Special Dairy Feed
Guaranteed to Make More Milk

Such a ration will cost less than a whole grain feed and will make more milk and keep the cows in better condition. Or if desired, International Special Dairy Feed can, itself, be fed as a whole grain ration, with better results and less cost than ever before.

Special tests and ordinary every day use by thousands of dairymen have proved that International Special Dairy Feed is a big milk producer—and feed bill reducer.

Try a ton of International Special Dairy Feed. Its ingredients are the best, its analysis just right, its results unequaled, it is guaranteed. Go to your dealer and order a ton today. If he cannot supply you, write direct to the mill.

Contract For Cows on Shares

In response to requests from many of our readers we give below a copy of a contract suitable to form the basis of an agreement to keep pure-bred cows on shares. It is to be remembered that this contract can be varied to suit special or local conditions, and that the terms of the contract can be modified or the contract terminated at any time by the mutual consent of both parties. It is desirable to have the contract extend over a period of at least three years and preferably five. It may also under certain conditions be desirable to incorporate in the second paragraph the names and registration numbers of the animals furnished by the owner, particularly if there has been no prior agreement and it is desired to specify the animals.

In the contract the owner of the cattle is termed the "party of the first part", and the person in whose charge they are placed is termed the "party of the second part". The form of contract suggested is as follows:

This agreement made and concluded this —— day of ———— 19— by and between ————, of the town of ————, county of ————, state of ————, party of the first part, and ———— of the town of ————, county of ————, state of ————, party of the second part.

WITNESSETH: 1. The party of the first part agrees to furnish and deliver at ———— within ——— days from the date hereof and hereby leases to the party of the second part for the term of ——— years from the date of their delivery to him not less than ——— cows of mutually agreed breeding and appearance that have been duly recorded and registered in the Herd Book of the ————.

2. The party of the first part further agrees to pay all the taxes assessed and levied upon said cows and in addition one-half of the taxes assessed and levied upon their progeny and other animals added to the herd from proceeds of sales or exchanges of progeny.

3. The party of the second part agrees to receive said cows when delivered to him and thereafter care for, feed, and breed them and their progeny in a legitimate business manner and to use at all times a registered sire of same breed whose dam has an approved official or semi-official record; to have every animal in the herd over six months old duly tested for tuberculosis at least once in each year; and to avoid the introduction of contagious abortion will not permit the herd sire to serve grade cows from other herds.

And it is mutually agreed by and between the parties hereto:

1. That the title and ownership of all the animals furnished by the party of the first part and their progeny and other animals that may be acquired by sales of progeny shall be and remain in the party of the first part.

2. That all male calves shall be sold by the party of the second part to the best advantage, age, and condition of market considered, and the proceeds, less expense of selling, advertising, transferring, etc., shall be invested in heifers of approximately same age as the males sold.

3. In case any of the original animals or their female offspring prove to be undesirable, they may, by mutual consent of the parties, be sold and the net proceeds arising from sales invested in other females.

4. The expense of registration shall be borne equally by the parties hereto.

5. In case of official testing the total expense, except board and lodging of the tester, in connection with the original animals furnished by him

How Pigs Were Fed

OARD'S DAIRYMAN:—Have seen
eral articles in Hoard's Dairyman
tive to feeding hogs. The past
on had some pigs born April 11,
8; fed them a swill of about two
rts wheat middlings to about 12
rts of water three times a day, all
they would clean up. To each
lbs. of shorts was added 10 lbs.
oil meal and occasionally gave
n a handful of salt in the swill.
in about three acres of sweet
and when this was in roasting
began feeding it, stalk and all,
hat they would clean up. When
fodder began to get dry and they
sed to eat the fodder, fed the
ed sweet corn; when the sweet
was gone, fed field corn. They
e never off feed. We killed them
'17, 1918, being 8 months, 6 days
and they dressed 225 to 253 lbs.
. I never had a bunch of pigs do
er than these.

The Essex—$1395

Light weight, Durable, Rich in Appointment, Low in Cost, Economical and a Tremendous Performer

Is Now Ready

You are to advertise the Essex.

Instead of our praising it, we wish you to do that. And what you will say is what we want everyone else to think.

Every praise that can be suggested has already been applied to some other car and, as you know, all cars do not come up to the claims made for them.

So the Essex must speak for itself.

It is endorsed and will be sold by the leading automobile dealers in every section of the world.

Dealers of their type do not take on cars about which they have the least doubt. They do not make selling contracts with new and untried organizations.

The Essex Will Endure

A real car must have stability. It must remain rigid and free from squeaks and rattles.

You will see why this is so with the Essex. Hard service cannot loosen the body joints nor twist the radiator.

Be sure this is emphasized by driving over cobblestone pavements or rough roads. Take any speed you like. You will find it a comfortable ride and will marvel that over such a road and at such a speed you are not pitched or bounced about.

Has Economy of the Light Car, Comfort and Endurance of the Costliest

The Essex's motor would inspire a whole season's advertising campaign. A slogan might be written about its beauty.

Its economy of fuel, lubrication and tires appeals to others.

It awakens the pride of ownership. It has dignity that comes from power and poise.

It will retain its smoothness and flexibility and quietness throughout long hard service.

The Essex is light in weight and cost. It is rich in detail and refinement.

Everyone says nice things about the Essex.

We Are Not Asking You To Buy Now. Just Ride in the Essex.

ESSEX MOTORS DETROIT USA

Only a few cars are available for each territory. The first ones are being distributed so as to reveal their qualities to the greatest number of people. When you see by the newspaper that your dealer is ready with his Essex, go look at it and tell your impressions to your friends.

WING'S Vegetable SEEDS

Stand for big yields. We offer the best that can be grown and can supply you with all the standard varieties.

Readers of this paper need no introduction to Wing's Alfalfa seed, Corn, or other field seeds. Try some of our specialties in vegetable seeds, and we will show you that they are equally good.

Wing's Red Sunrise Tomato

has given splendid satisfaction both to market gardeners and home growers wherever grown; ripens its first fruits the same day as Earliana, 30% more prolific, 30% more smooth fruits. Its main picking comes a week sooner than Earliana. Fruit is thick fleshed, with few seed cells, and with a firm skin. Pkt. 10c.

Wing's New Just-in-Head Lettuce

The earliest variety in our trial grounds, heavy yielding, lasts longer than any other sort we grow, and is the sweetest flavored, a truly wonderful head lettuce that actually does make solid heads to almost every plant on any good soil. Pkt., 10c.

New Catalog FREE

Describes the very best and most reliable sorts of vegetable, flower and field seeds, bulbs and some new and rare specialties which we believe can not be obtained through any other American seedsman. This Seed Guide gives cultural directions and tells how to plant for profit.

What Are They Singing?

Gulbransen Trade Mark

K-K-K-KATY"? "Smiles"? "That's the Kind of a Baby for Me"? "The Tickle Toe"? Well, what would your crowd sing at a lively party?

You can sing all these—and thousands more—with a Gulbransen to play them.

No trouble to read a song roll. Each word appears as big as THIS right on the paper at the moment it should be sung.

Is Your Home Dull?

Do people seldom "drop in"? Do your parties "drag"? Cheer Things up with music folks can sing. Nobody ever tires of music.

Mother songs—the rowdy chorus boys let out at stags—good old church hymns—love songs.

Yes, and the waltz the girls could "just die dancing to"—and today's jazz fox-trot with the words everybody wants to know.

Do You Know These Pieces?

These 21 pieces are the most popular right now. Several kinds of music are represented. Which would you play on your Gulbransen if you owned one?

Smiles
Oh! How I Wish I Could Sleep Until My Daddy Comes Home
'Till We Meet Again
Oh! Frenchy
Oh! How I Hate to Get Up in the Morning
My Belgian Rose
I'm Always Chasing Rainbows
K-K-K-Katy
There's a Long, Long Trail
Beautiful Ohio
Oui, Oui, Marie
If I'm Not at the Roll Call
Everything is Peaches Down in Georgia
Indianola
When You Come Back
A Little Birch Canoe
Sweet Hawaiian Moonlight
I'm Sorry I Made You Cry
For Your Boy and My Boy
Blue Danube
National Emblem

It's So Easy to Play —this Gulbransen

Its pedals work so easily a baby can play the Gulbransen. In fact, a certain baby did play the Gulbransen; that's where we got the idea for the trade mark.

You can be breathless from dancing—or exhausted by a hard day's work—yet play your Gulbransen enjoyably, delightfully.

Musical Possibilities

If you appreciate the finer music—of master composers—the Gulbransen is your instrument of instruments.

Muratore—world-famous tenor—plays a Gulbransen at home. Harold Henry—America's distinguished pianist—uses one in his studio.

You must put preconceived ideas behind when you consider the Gulbransen. It has taken the drudgery out of piano playing. But left in it—yes, put into it for most of us—the opportunity to play with expression.

The Leading Player—and Nationally Priced

For two years, more Gulbransens have been sold than players of any other make. Two things made this possible. The sheer quality of the instrument—its sweet singing tone—is delightfully easy operation. And the Nationally Priced plan—each model has but one price to everybody, everywhere in the U. S.—burned into the back of each instrument.

National prices, war tax paid:

White House Model $600 Town House Model $485
Country Seat Model 535 Suburban Model 450

There is a Gulbransen dealer near you. Look for trade mark—the Baby at the Pedals—in his window, or ask us for his name and address. We will gladly send you our catalog.

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powderpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer, 143 North Street, Adams, N. Y., and he will send you a free trial package, also color card and full information showing you how you can save good many dollars. Write today.

When Writing to Advertisers, Mention Hoard's Dairyman

Bran Sky-rockets in Price

[Continued from page 895]

"Supervisional control to preven profiteering," is how one official a Washington described the future po icy of Hoover's department.

With the millers' position so ur settled, dairymen almost automatica ly are thrown into a sea of uncertain ty. Some dairy interests may fe that the present price of bran an shorts is only temporary, that afte trade is readjusted to new condition prices will recede. This may be th correct view, though not the probabl one, and its correctness is depender on the government buying clear flou taking larger quantities of othe grades for export and redistributin its wheat to the domestic trade. Bu there is as much a question as to recession in prices of bran and short should this action be taken, as there in the possibility of the Food Admi istration taking the action. If the go ernment maintains firmness in i present stand, then a shortage of o fals will ensue with prices mountin to heights which we might now co sider impossible. With an acute shor age and possibility of still further a vances, it is apparent that to follo the safe and correct route is for th dairyman to purchase heavily of th precious feeds on present market If nothing else, the milk producer w assure himself bran and shorts.

Making Sausage and Head Cheese

HOARD'S DAIRYMAN:—On our far we have good success in making sau age, head cheese, etc., by the followin named methods. My wife was go enough to help me prepare these re cipes for publication.

To make head cheese, cook hea ears, etc., until good and tender al the meat will almost fall off the bon Pick out bones when cool enough put hands in. While warm grind th through the meat grinder. Season mixing with the hands and using sa and pepper (red and black), or se son half of the meat in this way al in the other half use ground onio pepper, salt, allspice, and cloves. this is already cooked it can be se soned to taste without frying an Place in shallow jars or bowls al put a plate over it to press it. It ca also be put away in cloth bags dippe in paraffin wax. To serve, slice cold dip in batter and fry.

In making sausage grind equ parts of lean and fat meat. Seasono taste with salt, pepper, and powdered sage. For each pound of meat use te teaspoonful of salt, one-half teaspo ful of pepper, and one and one-ha teaspoonfuls of sage. Mix the ingr dients and then stir them thoroughly into the meat. The sausage can be pu away by pressing it firmly into cotto bags and then dipping the bags in paraffin wax. Another way is to stuff it into corn husks, tie it up, and hang in rows in the smokehouse. Still an other way is to let the mixture stan over night, then fry it down in cake place these evenly in a jar and pou hot grease over them.

Use the liquor that is left fro making head cheese to make scrapp To do this place liquor over the fi until it reaches the boiling poi Sprinkle in salt, pepper, and sag then dust in corn meal until a spo will stand alone in the middle of th kettle. Pour out in a pan and wh cool it will become set. Let stand ov night and in the morning slice an fry brown on both sides in hot fa

To make sour souse take two le one front and one hind leg, and ab half of top of head from eyes dow boil together until every bone drop out and scarcely any water remain Pick bones all out and rinse meat o

Just as the Camera Saw It

Janesville Tandem Disk
Backbone rigid as concrete arch. Trailer always holds place. Made in heavier model for tractor use.

Budlong Disk Harrow
Cannot bind in the disk boxes. Bearings set flat against the shaft. Wear on spool is even—less load on team.

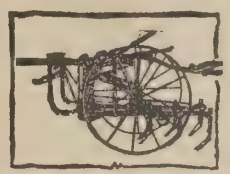
Hallock Riding Weeder
Pays for itself in a single season. Use in any field. Breaks crust three rows at a time. 40 acres a day. Broad, cast force-feed seeding attachment. Sows any small grain.

YOU will see the difference between Janesville and ordinary tractor plowing *in the first round* with this plow. It is due to the shape of the moldboard—the shape that built the Janesville reputation—the shape with long, low, easy turn that lays the soil evenly and uniformly. It is in the Janesville flexibility in the furrow, which allows the plow to adapt itself to the soft places, hard places, and the difficult scouring places. It is in the extra heavy, flexible frame. This flexible construction takes the "pinch" off the points and cutting edge of shares. It takes less gas.

14-inch bottoms are furnished. Can be set to cut 12 or 13-inch furrows merely by bringing the bottoms closer together by a simple adjustment. Rear bottom may be taken off or put on, making a two or three bottom plow at will.

Send for Janesville Book

Illustrations from photographs make clear to you why *every* Janesville tool is as much better than the ordinary as the Janesville Tractor Plow. Each machine is a *specialty*.

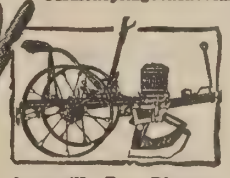


We would rather make a limited number of high grade *special* tools than a large number of common ones.

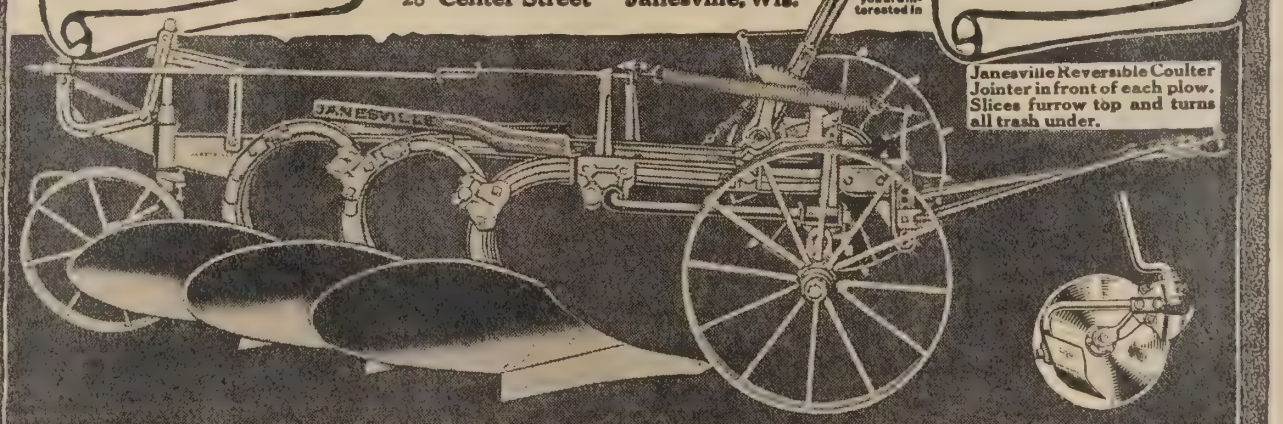
You would rather have the reputation of doing such fine plowing as that shown in the picture. It is easy when you use a Janesville.

With the Janesville Auger Twist Moldboard of our walking, sulky, gang or tractor plows you lay the even, uniform furrow which meets your idea of good plowing. With the Janesville Harrow you grip and pulverize *any* soil. Janesville Cultivators take the hard work out of cultivation. Floating arches make it easy to guide the shovels. Our line includes tractor plows, horse plows, disk and lever harrows, corn and cotton planters, listers, shovel and disk cultivators, hallock weeders, seeders.

Send for the Book—mention the tools you are interested in



JANESVILLE MACHINE CO.
28 Center Street Janesville, Wis.



Janesville Floating Arch Cultivator
Our newest machine—the first cultivator to use the weight of rider to help guide the shovels. Easier riding—does better work.

Two-Row Cultivator
Guide with foot levers which pivot wheels in any direction. Cushion springs on shovels.

Janesville Corn Planter
Shaft drive free from chains, sprockets, springs, breakages and needless repair bills.

Janesville Reversible Coulter Jointer in front of each plow. Slices furrow top and turns all trash under.

PASTURE COMFORT IN WINTER

CLAY Steel Sanitary Barn Equipment

is different from the ordinary equipment and every difference has additional advantages. It provides more comfort for the cow and convenience for the Dairyman.

The exclusive advantages in CLAY Equipment provide your herd with more pasture comfort that results in larger Dairy Profits.

THIS CATALOG TELLS WHY

CLAY Equipment is different and better. Send today for your free copy of this Barn Equipment Book.

If You Own Registered Cattle

If you are a breeder or owner of registered dairy cattle, you want a book in which to keep records. Here's one —worked out by the editors of HOARD'S DAIRYMAN— that "fills the bill".

Ninety-six pages; bound in buckram and lettered in gold. A book of quality in every way. On one side of each page is diagram for sketch—and a **four** generation pedigree. On the other side are spaces for breeding records and a seven-year production record.

The pages are numbered and perfectly indexed. Just the pedigree book you've been looking for. A place for all the records you need to keep—in a book you'll be proud to show any one!

Price $2.50, Post Paid

The price of this book is $2.50 postage paid. Just send a money order or check to the address below

Or Better Yet

Get just **four** of your good neighbors to subscribe for HOARD'S DAIRYMAN for one year—send us their subscriptions at $1.00 each—and we'll send you this $2.50 book for your trouble.

Here's a chance to get a few of your neighbors "started right" on dairy farming—and get this book without investing a cent! Those good neighbors of yours **need** HOARD'S DAIRYMAN this winter. And now is the time to get them to subscribe!

Hoard's Dairyman,

Fort Atkinson, Wis.

Interstate Milk Producers' Association

(Continued from first page.)

into line. We have blanketed our territory now but in some places the covering is too thin. We must no longer take the risk of allowing ourselves to be caught with an incomplete membership in any part. In the past, we have found ourselves hampered in a number of cases where we had local troubles because we had not a sufficient number of patrons signed up to a particular dealer. It is not necessary to go into details for all of you know of one or more such circumstances. The most serious feature is the reaction on the whole situation. A chain is no stronger than its weakest link—likewise a farmers' organization. At the National Federation meeting the one outstanding appeal was for organization and that it be perfected *at once* before it is too late to be in shape to meet conditions after the war. Your officers have found it necessary to visit many of our local markets during the past year in connection with the campaign to place all such places within the Philadelphia milk shed on the basis of "Philadelphia price less freight". Most of these conferences have been held in connection with the Pennsylvania Food Administration and it is hoped that the results will be permanent so that hereafter local price will change automatically with the price in Philadelphia.

Finances

Commissions are now coming in regularly through the majority of distributors and manufacturers; a large number of farmers send in individually but from some the association fails to get any financial support. We are hoping that such will remit in the future for the activities of the association are limited by the financial backing of our members. During the past year expenses have been naturally larger both by reason of new lines of work and also on account of increasing traveling and maintenance expenses, and at present there are a number of propositions waiting for the association to undertake.

The accomplishments of the association during the past year have been chiefly in the line of meeting the conditions as I have outlined them. Some more or less independent achievements have been (1) the matter of relief from loading milk on trains by independent shippers, (2) securing improved transportation facilities and rates where conditions were not satisfactory, (3) the collection of many bad bills and some back pay, (4) acting as agents in the purchase of dairy feeds though in this we are very seriously hampered by the antagonistic attitude and activities of the dairy feed interests of the country, (5) the establishment of a shipping station at Huntingdon, Pa., which will furnish a market for a county, the farmers of which a year ago were compelled to take 6c for their milk delivered in town or make it into butter for which they received perhaps 50c a pound, (6) the settlement of innumerable disputes between producers and dealers and the re-establishment of some shipping stations which have been closed for one reason or another.

Butter the Safety Valve

Three important matters have been driven home to the executive committee by events during the past year and I feel I must speak of them again today. *First,* that the increased use of oleomargarine will vitally effect the market for all milk when conditions become normal for butter has always been the safety-valve. As dairymen we must use all dairy products on our own tables and every effort must be made to encourage co sumers to go back to butter which more digestible and more palatat even if it can never be made cheaply as the substitutes. *Secon* we want to compliment the membe of the association on the fidelity wi which they have kept the policy the association regarding changi dealer without sufficient reas Though some few exceptions ha come to our notice, the number dc not begin to compare with form years and very, very few have be members of the association. *Thi* we have in our territory no partic lar legislative requirements regardi care in handling our milk. This plac upon us a responsibility as well as opportunity to keep our standard without interference and if our me bers prove that this can be done will not be likely to have drast unreasonable, municipal regulatio which have been a torment to pi ducers for some other cities. The sociation has used its influence to i prove the quality in a number cases where we had complaints. Th is always some reason when milk rives in market unsalable. The tr ble may lie with the *producer,* or t *dealer,* or the *railroad,* or partly w *all three.* Whatever care we exerc is in the long run reflected in an i proved market and we cannot expt to get top prices unless we furnish first class product.

Future Plans

Of plans for the future I can on say that we have secured the co-op ation of the other producers' orga zations of the state in a legislat program to be introduced at Har burg the coming winter. We planning for an educational exhibit Harrisburg in connection with January meeting of the Pennsylva Live Stock Breeders' and Dairymes Association meeting. It is hoj through this to bring home to prod ers of the state the importance of ke ing up the quality of their prod particularly in cleanliness, and show them how relatively simple it to produce milk that will be satisf tory in the market to which it is se The association is still furnishing erature approved by the Food ministration for distribution throu out our territory and has 50,000 these on hand at the present time distribution. We expect to continu co-operate with the Food Administ tion as long as it exists and alread number of plans have been sugges to make permanent the good situat which has come about during the p year.

Throughout the year your direct have sought to keep constantly bef them the ideals of justice and co-op ation and have tried to make their cisions in the light of these princips We have certainly made many mistakes but we have endeavored at times to profit by them. We have tr neither to shirk responsibility nor assume more than that which is gi by the by-laws under which you h directed us to carry on the busines of the corporation. On behalf of Board, I wish to thank you for y unswerving loyalty and active s port. The new Board which you h just elected will serve during a riod which will be fraught with momentous economic dangers and w will require the very best which i us all, in order to steer a course that your business may weather storms. I know I need not ask today to give the new Board the s measure of support, but I do ask you carry this message home so t those who gather here one year he may be able to say that every m ber of the association did his pa making the association bigger better than it is today.

Dairy Regulations Recommended

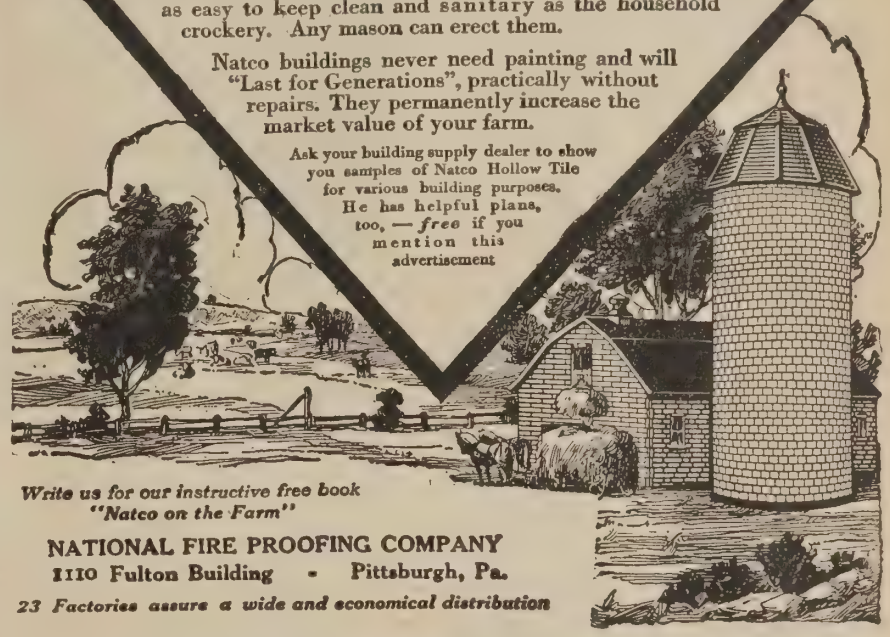
The Dairy and Food Commissioner of Wisconsin, Hon. Geo. J. Weigle, has made the following recommendations to the legislature of that state:

1. That provision be made for adding harmless coloring matter to unsanitary milk so as to prevent its being offered for sale at other places.
2. That cream buying stations be licensed in same manner as creameries and cheese factories.
3. That where milk or cream is bought by test that the person doing the testing be required to take out a license in order that the state may more closely supervise the work.
4. That fines be levied against the corporation or firm selling unsanitary milk as well as against individuals or officers of corporations.
5. Section 4607c of the statutes permits the manufacture of skimmilk cheese, provided it is ten inches in diameter and nine inches high. While this law permits the manufacture of skimmilk cheese, it does so only if it is of certain dimensions and would exclude all soft cheese, such as Cottage, Edam, Camembert, and numerous others. It seems quite likely that when this law was passed, it was the intention of the legislature to prohibit the manufacture of skimmilk cheese made in imitation of American cheese. It seems advisable that our law should be amended making it lawful to manufacture such cheese as Cottage, Edam, Camembert, and numerous others of similar type. Care should be taken, however, in amending this law, not to permit cheese to be manufactured in imitation of American, Brick, Swiss, or Limburger cheese and also that all skimmilk cheese be properly labeled.
6. During the 1917 session of the legislature, an amendment was passed limiting the moisture in American or Cheddar cheese to 40 per cent. It now seems advisable that the moisture in Brick cheese be limited and I would therefore recommend that this addition be made to the laws.
7. Under the present law the dairy and food commissioner's term is for a period of two years. The laws to be inforced by the dairy and food commissioner are so numerous and of such varied nature and his responsibilities are so many that to me it seems more efficient work could be accomplished if the term were extended to a period of about five years. As a matter of fact a man unfamiliar with the work of this department finds that considerable time is necessary to familiarize himself thoroughly with the laws and their application. This extension would be in harmony with the term of office of many of the other commissioners in the capitol.

The Dairy Cow

The dairy cow's a thing of charm; she lifts the mortgage from the farm and makes the farmer's life more sweet and sets him down in Easy Street. Where'er the dairy cow is queen, a country prosperous is seen, and dairymen, in joyful ranks, are packing bullion to the banks. Why plug along, the old sad way, producing nutmegs, prunes, and hay, and puting up a bankrupt wail if one year's crop should chance to fail? There is a better method now—the method of the dairy cow; this critter always earns her keep, and piles up riches while you sleep, and pays the taxes and the rents; and here in Lyon County, gents, we have the climate and the feed, and all conditions dairies need. So let us boost the Holstein cow, which beats the old breech-loading plow; the Guernsey and the Jersey, too, as smooth as any cows in view. Let's take up dairies, milk and cream, the safest money-making scheme.—WALT MASON.

Build Once
Build Right

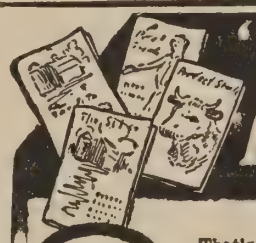


It is given to but few farmers to erect more than one set of buildings. It pays to build right the first time. You should therefore consider the advantages of Natco Hollow Tile. An ever-increasing army of farmers are finding it a fire-safe, permanent, economical and sanitary building material.

Natco Hollow Tile

walls are insulated by dead-air spaces. They keep out the frost of winter and the heat of summer. These walls are as easy to keep clean and sanitary as the household crockery. Any mason can erect them.

Natco buildings never need painting and will "Last for Generations", practically without repairs. They permanently increase the market value of your farm.



Ask your building supply dealer to show you samples of Natco Hollow Tile for various building purposes. He has helpful plans, too, — *free* if you mention this advertisement

"Silage perfect, from top to bottom"

FREE Four Valuable Booklets

That's the story that R. G. Warren of Union City, Mich., writes about his ROSS METAL SILO. Mr. Warren also says: "The weather conditions at the different times I inspected the silage ranged from zero to 20 degrees below, but I found no frozen silage on the sides, didn't have any trouble in keeping silage at a perfect level with an ordinary silage fork and no spoiled silage from any cause whatever." That's the satisfaction of

ROSS In-de-str-uct-o Metal SILOS

8 Years Use and Perfect Satisfaction

Your letter of inquiry regarding the Metal Silo I have. It has been in use 8 years and has given perfect satisfaction and is as good today as ever. No tightening of hoops, or any bother whatever. Not even been painted. Would not have any other kind.
C. H. METHOD,
Goshen, Ind.

Silage Your Stock Will Thrive On

A ROSS METAL SILO is air tight—no air can work in and spoil the silage. The natural juices of the silage are retained and allowed to properly ferment, and every fork full from top to bottom is clean, pure silage that is fit to feed and on which your stock will thrive. The ROSS is easily put up by one man in spare time. It is made of rolled metal and properly treated to withstand all climatic conditions, as well as the acetic and lactic acids contained in ensilage. Each metal sheet is enameled—not galvanized—the outside with three coats of battleship gray and the inside with four coats of black, acid-resisting enamel which should last more than the usual lifetime.

Send for Free Booklets

The more you know about silos, the better will you be able to judge which kind best answers your purpose. So we want to send you these booklets containing many facts which you may want to know before you buy your silo. Your name on a postcard will do. Send for them today.

Coming Events

Massachusetts Dairymen's Association meets in Horticultural Hall, Boston, Mass., Feb. 10, 1919. Acting Secretary, O. A. Jamison, Amherst, Mass.

Western Dairy Products' Show and Annual Meeting of Western Dairy Instructors' Association will be held at Boise, Idaho, Feb. 10, 11, 12, 1919.

Minnesota State Dairymen's Association hold annual convention at Waseca, January 21-23, 1919. Chris Heen, Secretary, Osakis, Minn.

Illinois State Dairymen's Association at Bloomington, January 21, 22, 23, 1919. George Caven, Secretary, 136 W. Lake St., Chicago.

Wisconsin Buttermakers' Association hold annual convention at Eau Claire, February 4-6th, 1919. Prof. G. H. Benkendorf, Secretary, Madison.

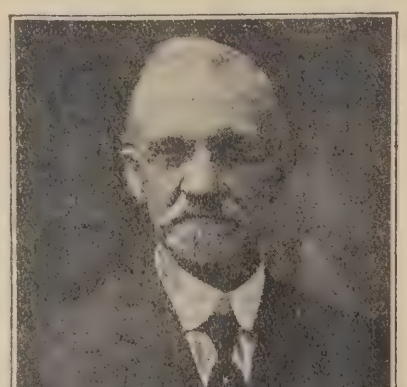
Kentucky Dairy Cattle Club meeting and Dairy Show, Jan. 30, 1919, at State University, Lexington. Secretary, J. J. Hooper, Lexington.

Moore Sale Cancelled

The dispersion sale of M. E. Moore and Company's Holstein herd which was to have been held at Cameron, Mo., Jan. 31, has been cancelled. Instead, the herd will be sold at the Kansas Breeders' Sale in February.

Dairymen's League Meeting

About one thousand members of the New York Dairymen's League met in Utica last week. Many stirring addresses were made regarding the present milk situation and it was unanimously voted to stand by the organization. Delegates were selected to appear before Governor Smith and set forth their side of the milk price controversy. There seems to be little prospect, as we write, for a speedy adjustment between the dealers and producers. The farmers are loyal and determined to win their fight.



We are advised by telegraph that Governor Smith has appointed a commission of six to adjust the price controversy.

A. A. Cortelyou of New Jersey, owner of the Bloomingdale herd of Holsteins and director of the Holstein-Friesian Association of America, died December 22. For a quarter of a century Mr. Cortelyou has served on the Association's Board of Directors, holding the office of president for a period. Few men have done as much in the interest of the black and white breed in America.

Mr. Cortelyou's herd is one of the oldest and best founded in the country. He maintained breeding animals of such merit that many famous individuals were developed. Johanna Rue 3d's Lad, Hengerveld DeKol, and King Fayne Segis were all used as

A. A. CORTELYOU

herd sires. Mr Cortelyou bred the two highest short period record cows in the world.

In the master of Bloomingdale herd were represented the highest qualities of friendliness, integrity, and constructive vision. His work as a leader and counsellor among dairy cattle breeders makes his death a loss to the entire body of dairy farmers in America.

New York Milk Situation

Members of the Dairymen's League ask $4.01 per hundred for three per cent milk for the month of January and the large milk dealers of New York City refuse to buy milk at this price. Dealers in other cities have willingly bought milk at the farmers' price and deliveries are being made to consumers as usual. New York City is receiving about 50 per cent of her normal milk supply and this is coming from sections outside the territory of the members of the League.

Mr. R. D. Cooper, president of the Dairymen's League, has made the following statements concerning the present acute situation between the producers and dealers:

"Consumers of New York City are being deceived about the facts in the present milk situation. A few of the larger milk dealers in a combine known as the New York Conference Board are spending thousands of dollars circulating clever but untruthful statements about the farmers in the Dairymen's League. We will welcome any fair investigation that will bring out the facts in the case. Many investigations of the milk situation which have already been held, have shown without exception that the average farmer was not only not making a profit out of milk, but much of the time was obliged to produce milk at less than cost. The same investigations, on the other hand, have shown that the dealers were profiting at the expense of both the farmers and the consumers.

In 1916 a joint committee of the legislature was appointed by the governor to investigate the whole dairy situation. This committee travelled all over the dairy sections of New York during the fall and winter of 1916, held a large number of hearings, and then came to New York City and made a thorough investigation of the distribution system.

Here are a few extracts from the committee's report on dairy conditions:

"That the state was and is threatened with the possible decay of the dairy industry is apparent. No problem of equal importance confronts the people of this state and the problem is a more vital one to the inhabitants of our large cities than to the agricultural communities.* * * Sheep husbandry has already departed and the art, if it has not already disappeared, is rapidly disappearing. Our farmers who wish to engage in that industry must even now seek skilled help from without the state. Shall the dairy industry be allowed to follow that of sheep raising? It must always be borne in mind also that such industries when once decayed or lost are not easily restored. * * *

"The committee is of the opinion and accordingly reports that during a period of several years the dairy farmer, laboring industriously and thriftily as he might, was not able to procure such reasonable price from the sale of dairy products in this state as to earn a fair labor and invested capital return. * * * The consumer can only be assured of an abundant supply of these necessary products, and the state can only retain this important industry within its borders, ensuring present food and future fertility of our soil, by endeavoring to bring about such conditions as will provide to the producer a fair and reasonable return for his labor and invested capital. That the dairy farmer was unable to earn a fair and adequate return in the industry during several years past was conclusively established, in the judgment of this committee, by abundant evidence in practically every farming community in this state."

So much for the producer. Now let us quote from page 576 of the same report on distribution conditions as the legislative committee found them in New York City:

"It is customary in referring to unnecessary expenses in milk distribution to refer to the fact that four or six or ten milk wagons and milk drivers visit the same block which one might well supply, but this ignores the really greater expense of the silent army of retainers that accompanies and follows the milk wagon in its daily round. This army is marshalled by each company and sets out daily to capture the other man's customers. Not only do we find in a single block six wagons and horses and drivers where one might well do the work, but on the same day we find operating in the same block six solicitors, six route superintendents having general charge and direction of their activites, six staffs of clerks and bookkeepers who will devote part of their time and attention to that block for that day, and each and every part of perhaps twenty other companies devoting [illegible] the certain block a portion of the time and the consumer's money in the struggle to ascertain which company shall survive in rendering its inhabitants a single service. It may safely be said that no person of understanding has ever studied this question without reaching the conclusion that the distribution of milk is a public service, which, to be put upon an economic basis, requires public regulation to the end that all unnecessary services even of a competitive kind may be eliminated."

The above facts show just where the trouble is in the present acute situation. The farmers know and have known for a long time that the consumers were being robbed by the milk dealers of New York City and the sooner the consumers realize this and take steps for closer co-operation between the farmer and the consumer the sooner the farmers will get the just costs of production, and the consumers their food at proper prices.

Impressions of the New York Milk Strike

HOARD'S DAIRYMAN:—World [illegible] has ceased, but the milk-war is [illegible] once more and New York dairy soldiers are rallying to the bugle-call of their organization, the Dairymen's League, which on New Year's day sent out the word to strike and keep home our milk, as the dealers, under the direction and approval of Mayor Hylan, New York City, had refused the price set by the League for January. Here, in the dairy county of Chenango, we are solidly massed and will never give in to the big city which unnaturally refuses to recognize our rights to costs and a small profit which we demand, but instead chooses to listen to the anti-dairy propaganda which seeks once more to crush the producer and then betray the consumer as it has done so many times before.

The press of New York is bitter and skeptical towards us. They appear to be doing everything in the power to inflame the consumer against us and to keep the trouble waters stirred up. We have few friends to stand for us; few will care to take the pains to find out we are really baby-starvers and profiteers, as the gang glibly insists; and our New York representatives are being heckled and accused at every turn and our testimony and proofs are distorted and changed.

It is a bit discouraging and black this situation in which we find ourselves precipitated.

In my own town of North Norwich Otto Gruhn, who owns our shipping station, gave in to the League after two days of striking. Mr. Gruhn operates several factories and the milk is shipped to Brooklyn for distribution. But in Norwich, which is blessed or cursed with a Borden plant, the League members are still waiting grimly and tenaciously for this most heartless and richest concern to come to terms—but will they?

The attitude of the New York consumer is what worries me more than anything else at this time. I can help but believe that if we had entered their camps immediately following the strike of several years ago and had followed up that victory with elaborate proof and explanation the ones who seek our overthrow now would bray to deaf ears and this second fight would not have come on. But many people have taken the stand that time and tide will do much for the dairyman's cause any aggressive action on his part, and that there was no need of any parti-

'illy Alcartra—World's Greatest Food Factory

California Holstein Again in Limelight With World's Best Milk Production

FRANK T. PRICE, NEW YORK

EREAFTER there will be a new standard for judging dairy cows Tilly Alcartra of California is to ve anything to say about it. For lly, the perennial producer of the olstein-Friesian breed, is setting a e work standard for the other big oducers in the dairy world to shoot

This cow which has just broken all cords for milk production over a arly period has a unique record production extending over a six-ar period that is unapproachable om most every angle. Her latest oduction which has just been an-unced as a world's record for one ar in milk production is 33,424.8 . milk containing 1,058.39 lbs. fat. We have become accustomed to dge Holsteins by two standards and e introduction by Tilly of a third ens up a new field of endeavor for olstein breeders. The breed's repu-ion and popularity 's built upon e Holstein's ability to produce in ort time test. Later, and becoming ry rapidly more popular, particu-ly in the West and Middle West, e yearly test has been accepted as accurate standard for judging the olstein's value as a dairy cow. And w Tilly comes to the front with a for lifetime honors. She has es-olished by her yearly and large ort time records a correction be-een two methods of judging pro-ction and made a new classification well. Needless to say, her owners ll humor Tilly's latest ambition and an to keep her hard at work until e is called to the bovine happy nting grounds to browse forever in curious alfalfa pastures, nibble suc-lent beets, and be served with the iry world's choicest grains.

Tilly's record for a lifetime of use-lness is based upon the following oduction figures, authenticated by r owners, the A. W. Morris & Sons rporation of California:

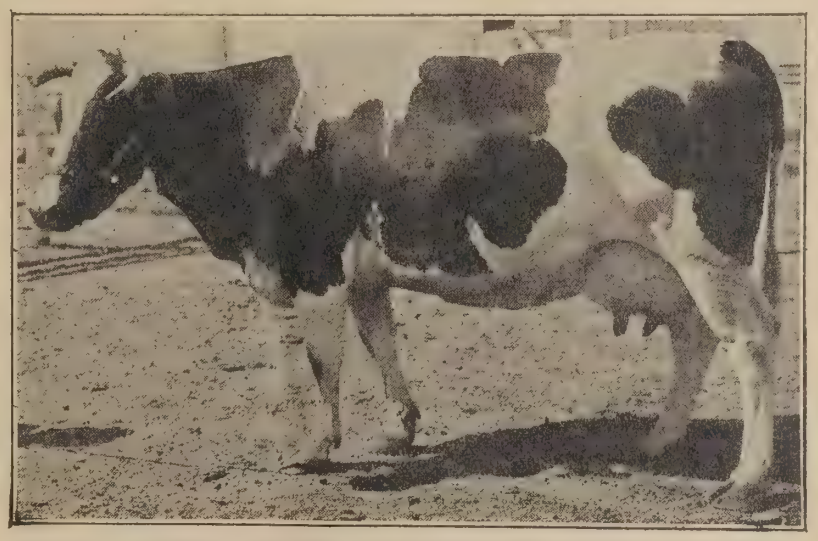
Age	Lbs. fat in year	Lbs. milk in year	Lbs. fat in 7 days
rs. 6 mos.	445.0	14,837.2	13.91
rs. 5 mos.	673.0	21,421.3	18.52
rs. 1 mo.	951.2	30,451.4	23.42
rs. 5 mos.	952.4	29,826.6	25.78
rs. 7 mos.	833.7	26,814.8	(not tested)
rs. 3 mos.	1,058.39	33,424.8	
al, 6 yrs.	4,913.6	156,776.1	

Think of it, dairymen, over 4,900 s. of fat in six years and a milk oduction of over 156,000 lbs! Put ur pencils on this production at av-age prices and find out what Tilly's ners have actually realized in iry products during the remarkable reer of this wonderful cow whose efulness is not yet ended by any ans. Study the economy of her eding which is shown by this latest ar's record and which is given in ll elsewhere in this story and learn rough a single actual example a les-n that the dairy press has preached r years—the true economy of high oduction.

The limitations of time and space ll permit no more than a brief etch of the achievements of Tilly cartra since she first began pursu-g the elusive wraith called Fame, t the fact that her pursuit has been irly successful may be deduced from e statement that perhaps no other w is better known among pure-bred ttle than she. Her record breaking rformances have been chronicled in re space than the performance of y other single animal and that, in ese days of high powered advertis-g campaigns, means something to her ners. It adds somewhat materially her value as a money-making asset.

This latest record which Tilly uses to press agent herself into the presence of thoughtful dairymen of America is remarkable. It exceeds by over 2,000 pounds the work of any other cow in the world for milk production over the yearly route. It beats the best the Guernsey has been able to produce by over 9,000 lbs. and the Jersey champion is over 13,000 lbs. in the ruck. It requires an average daily production of 91 lbs. to reach this total and since her highest day's milk production for the period was less than 120 pounds it will be seen that Tilly's is, to say the least, a wonderfully consistent performance. Had the over 33,000 lbs. of milk she produced been retailed at 15 cents per quart it would have netted her owners $2,600. At the price for which it sold, $2.75 per hundred pounds, it actually did bring them $920.

When economy is to be considered the latest record of Tilly Alcartra exceeds by all margins every mark ever heard of. Her feed bill, based on conservative estimates, was less than $300. Her average grain consumption was but 16 pounds and consisted entirely of grains that are readily available to the average dairyman. They can be and are successfully grown on the average farm. Here is the summary of her feed consumption during her test: 1,525 lbs. ground barley, 1,325 lbs. ground oats, 1,325 lbs. bran, 1,165 lbs. soya bean meal, 532 lbs. cottonseed meal, 200 lbs. linseed meal, 21,000 lbs. beets, 2,550 lbs. beet pulp, 3,000 lbs. silage, 5,000 lbs. alfalfa hay; pasture 4 hours daily for 9 months. It is worthy of note that Tilly consumed over 100 lbs. less concentrates during this test than did the new champion of the Jersey breed, Sophie's Agnes, who has recently completed her record of just over 1,000 lbs. fat and 16,212 lbs. milk.



Can any other cow in the world show such an efficient record of production with such economy of raw material? Can any food factory regardless of its kind show such a record? Records such as these prove the importance of the dairy cow in the scheme of food production and dairy organizations everywhere can preach a remarkable sermon from the text that Tilly sets.

Holstein men will be largely interested in the claims which Tilly Alcartra sets up. She has proven that she is beyond a doubt a better long-time producer than the Jersey champion, Sophie 19th, for which has been claimed the title of champion long distance cow of the world. Tilly produced in six years over 4,900 lbs. of fat, Sophie produced about 4,885. Tilly produced over 156,000 pounds of milk—Sophie a little more than half as much. While Sophie has a seventh year to her credit the total of her seven years is but 367.8 lbs. over Tilly's six years in fat production and it falls short a mere 65,000 lbs. of Tilly's milk production with seven years totaled against six for the latter cow. Tilly will freshen again in less than three months and has every prospect of going right ahead in the same old record-smashing way.

Tilly Alcartra thus stands as the only cow with a 7-day fat credit equivalent to more than 40 lbs. of 80 per cent butter to amass such a record in long time production. She is the only cow to have produced over 30,000 lbs. of milk in two different years. No other cow has produced above 29,000 lbs. of milk in three different years and, further than this, Tilly is the only cow to average 30,000 lbs. milk for four years. She is the only cow of any breed that has produced over 950 lbs. of fat on three different years and also the only cow to make over 800 lbs. of fat on four consecutive years. Sophie 19th has four 800-lb. fat records but they were not consecutive.

This old champion with the new records was bred in Iowa by McKay Brothers. Her sire was Alcartra Polkadot Corrector and his dam was a former world's champion and one of the breed's greatest foundation cows through both sons and daughters. Tilly went to California as a yearling and it is in the Morris herd that her wonderful records have been made. Tilly, best of all, transmits her remarkable characteristics, for her oldest son has a long string of two-year-old daughters with records that reach up to figures that surpass the two-year-old records of Tilly herself. She is a product of careful selection and breeding, proper handling in development, and a credit to the dairy world through the results of these two circumstances. Her work, as we have suggested before, might well be taken as an example of the wonderful possibilities of the dairy cow as a producer of food.

Thus Tilly Alcartra has established the new classification for judging the merits of the dairy cow. Thus has she proven that even the short time record still has a place in judging the ability of a dairy cow. Thus has she proven, and most important of all, that the dairy cow is the most efficient food factory that man has ever known, furnishing as she does the greatest food and at the least cost. Tilly Alcartra, by this, rises above the breed, above mere competition. She becomes the embodiment of all that is sought by those who strive to put the dairy industry on the extremely high plane its paramount importance deserves in man's plan for existence.

TILLY ALCARTRA, HOLSTEIN, WORLD'S CHAMPION MILK PRODUCER.
She has recently completed a record of 33,424.8 lbs. milk containing 1,058.39 lbs. fat. In six consecutive lactation periods she has produced a total of 156,776.1 lbs. milk containing 4,913.6 lbs. fat. Tilly Alcartra is owned by the A. W. Morris and Sons Corporation of California.

Jersey Cattle Notes

For week ending Jan. 3, 1919:

Number of animals registered: Bulls, 112; cows, 293; total. 405. Number of transfers recorded: Bulls, 165; cows, 590; total, 755.

Does Not Winterkill

Genuine Grimm is most profitable because of its hardiness, large yields and high feeding value. Less seed required to get a stand. Booklet, testimonials and seed sample free.

A. B. LYMAN, *Grimm Alfalfa Introducer*
Alfalfadale Farm, Excelsior, Minn.

Low Crown Protects The Plant Against Frost Drought and Rodents

Lyman's Genuine Grimm Alfalfa

Seed Corn 5,000 Bushels Extra selected, sure to grow. 20 Leading varieties. Highest yielders. Best show corn. Also seed oats, barley, alfalfa, Spring wheat. 1200 acres. Sample on request; write today for catalog. W. N. SCARFF & SONS, New Carlisle, Ohio.

Milk Record Sheets Free

Year's supply without charge. Ask about it and we will send Free Book on Cow and Calf Diseases, invaluable to every Dairyman or Breeder.

CURA-BOS SCOUR and CHOLERA Remedy. Guaranteed to cure and prevent. $1 and $2 sizes. Prepaid. Act now before too late.

Troy Chemical Co., 328 State Street, Binghamton, New York
Mfrs. of Cura-Bos, Save-the-Horse and other Famous Veterinary Remedies.

Don't Waste Wool

Old methods of shearing leave too much wool on the sheep. Shear the modern way with a good machine. The Stewart No. 9 Ball Bearing Shearing Machine works wonders with flocks up to 300 head. Saves time and money—shears 15% more wool. Does away with second cuts. Soon pays for itself. You can get it by sending $2.00—balance on arrival. Or write for catalog. CHICAGO FLEXIBLE SHAFT CO.
Dept. 156, 12th St. and Central Avenue, Chicago, Ill.

STOP Waste and Loss

Cools and aerates milk at one operation—removes odors—halts germ growth. Save time and money.

The IMPROVED CHAMPION MILK COOLER-AERATOR

Saves its cost in one week. Folder free.
Champion Milk Cooler Co., Dep. D, Cortland, N.Y.

WE PAY A VERY HIGH PRICE FOR RENNETS

CALF RENNETS FROM MILK-FED CALVES
THE MARSCHALL DAIRY LABORATORY
Madison, Wis.

THE "PERFECTION" KERO-GAS STOCK TANK HEATER BURNS ordinary cheap kerosene, and produces a steady blue flame of an intense heat. Simply fill the oil can, light the burner, and your service begins. No fires to kindle, and tend to during the day, no ashes to remove, *no sparks* to fly to burn your buildings, you can place the heater right inside your barn. *No soot* inside of heater, water starts circulating instantly the same as placing a tea kettle on a hot stove. Here is a heater of quality, costs a little more but is worth more, received highest awards at four state shows, and receives highest endorsement wherever shown. More square inch heating surface than other makes, 26" high by 36" long. Price $25.00. Write at once for special introductory price on first heater in localities.
Mfg. by The Kero-Gas Products Company, Albert Lea, Minnesota.

Jacques Golden Glow Seed Corn—Germination Test 98.

My Golden Glow is two weeks earlier than the ordinary run of that variety of corn. I have bred it in Northern Wisconsin for many years. It is suitable for use in Michigan or New York or any part of the Northern limits of the corn belt and substantially as early as any flint corn suitable either for grain or for silage. This year my crop averaged 60 bus. shelled corn per acre on all fields planted. Price 10c a lb. F. O. B. Neillsville, Wis. Money refunded if corn does not test as represented. Include with order 75c for each grain sack used and furnished by me or mail sacks to me and save this charge. If you want any of this corn it should be ordered immediately as my stock has never lasted until the end of the season. Wm. H. Jacques, Neillsville, Wis.

EDITORIAL COMMENT

LET RAILROADS LOAD MILK

The tariff on market milk of some if not all of the railroads east of Chicago requires the shipper to load his milk on the car. This may be the requirement for other kinds of freight or express but, if so, we are not advised. It is enough for the shippers of most products to bring their wares to the freight depot or the express office where they are received by the agents of the transportation companies and at this point the shippers' duties should end. It seems to us an imposition to require the milk shippers to load their own milk.

Much time is wasted by milk shippers, especially at large shipping points, waiting for trains in order to load their milk. We have been informed that shippers take turns in loading one another's milk or they employ a man through their association to do this work. No matter what system of loading milk is followed by the milk shippers, it is an expense to them. It is the duty of the shippers to deliver their milk to the railroad receiving stations, but it is the duty of the transportation companies to load the milk on the car. Milk shippers should insist that this service be rendered them, as it would be asking no more service than is extended to shippers of other products.

SURPLUS MARKET MILK

The Milwaukee Milk Producers' Association is making its surplus milk into cheese. It is largely through the efforts of its competent secretary, Mr. G. R. Rice, that this step was taken. The surplus now runs from none to 20,000 lbs. of milk a day. Of late, the milk supply has been on the increase, but this will work no great hardship upon the association for the present price of cheese will bring nearly as large a return as selling the milk for direct consumption.

Cheddar cheese is selling for 37 to 39 cents a pound. One hundred pounds of milk testing 3.8% will make 10 lbs. of cheese. This would bring a gross return of about $3.70 per hundred. The cost of making will vary, because of the varying supply of surplus milk. But even under these conditions 30 to 40 cents per hundred pounds milk should bear the cost of making the cheese.

Disposing of the surplus milk has been the difficult problem of many milk producers' associations, but the producers in the district of Milwaukee have solved it by making it into cheese. Other associations may find it more advantageous to make butter and cottage cheese or some other kind of cheese from skimmilk. There are various types of skimmilk cheeses which have a good demand. This field should claim the attention of every secretary who has the problem of caring for surplus market milk.

"SPEAK SOFTLY BUT CARRY A BIG STICK"

The New York milk strike has brought forth a companion piece to the famous "Public be Damned" statement that has since been much regretted by its author, a certain former railroad autocrat. Mr. Loton Horton, president of one of New York's largest milk distributing companies, is reported to have said: "We will decide what we will pay the producers for milk and what we will charge the consumers."

Possibly Mr. Horton has the producers and consumers hog-tied and at the mercy of his benevolent dictation; but even so, we can hardly credit him with so great a lack of intelligence as to publicly declare their shame and slavery. In a matter of so great concern and to so many people we scarce want a wilful group of men to "decide", particularly when they are the middlemen who profit by the decision. They may feel that the business is their own to do with as may well please them, and that they will play the tune while producers and consumers pay the piper, but it is another thing to have them tell us so.

We crossed an ocean to the famous "three thousand miles away", to fight the battle of democracy against a political and inhuman autocracy. That fight is won; shall we now continue to suffer an autocracy of middlemen to have its own sweet will at home? We have faith to believe the New York Dairymen's League will have strength to win this particular battle for industrial democracy, after which may they take as their own slogan "Speak softly, but carry a big stick", the maxim of that goodly fighter for democracy and the people's man, Roosevelt, the news of whose death comes as this is written.

This slogan is offered advisedly, for no matter what the decision the fight will still go on. The city consumer, befuddled, befosseled, and betrayed by the New York daily press, is angry and hails the producer as a consciousless profiteer who would sacrifice their helpless babies upon the altar of the God of Mammon. The angelic dealers and the self sacrificing daily press draw their robes of white about them and, placing the halo of sanctity on their own heads, tell them they will do their best to insure milk to babies while the proud producers gamble with human life that they may feather their own nests. It's absurd to think that people will believe such nonsense, and, if they do, that there is not an exodus to the country to try the 4 o'clock rising and the eight o'clock bedtime; that is, if the chores are all done and one of the cows is not sick. Yes, to meet this the producers must speak softly, but carry a big stick.

COMPETENT PRODUCERS' ASSOCIATION

On page 885 of this issue we publish the annual address of President F. P. Willits of the Interstate Milk Producers' Association. President Willits has clearly outlined what his association has done in the past year and also states the duties of a well managed milk producers' association. We most heartily commend this article to our readers.

In commenting upon feed formulas for arriving at a price for milk, Mr. Willits well states: "However, it would seem to me that it is far easier to discuss the value of milk than to haggle over the items of corn, feed, hay, and labor, knowing all the time that, after all, you are particularly concerned with the price of milk. Then, too, our Association fears that in times of surplus it may be difficult, temporarily, to get even production costs and, vice versa, the formula could readily tie us down below the market value of our product when the market was improved again."

Mr. Willits sees the danger of farmers tying themselves up to feed formulas and selling their products upon a basis of cost of production plus a profit. He recognizes that there are certain fundamental laws governing trade which the farmers must follow, the same as all other industries. In this matter we heartily concur with his views, for if the price of milk is to be fixed upon the cost of production plus a profit, then the prices of everything the dairyman buys and uses will likewise be marketed in the same way. This would lead to endless confusion and dissatisfaction. What we as dairymen must ever prevent is combinations interfering with the law of supply and demand.

The feed formulas in time of war were helpful in securing for the producer a fair price for his milk, and they will be useful in times of peace to determine whether the producer shall continue to produce milk at the price he can get for it upon the market. The consumer cares nothing as to what a thing costs. He measures all his articles from a selfish standpoint—what are they worth to him. It is our duty to educate the consumer regarding the food value of milk and its products, and when he thoroughly appreciates their cheapness compared with other animal foods, he will be ready to pay a fair price.

BRAN SKY-ROCKETS IN PRICE

Elsewhere in this issue we publish an article entitled "Bran Sky-rockets in Price". Mr. Sosland discusses this subject to some length, and we are sure it will be interesting to those desiring bran to read his account of conditions and circumstances that caused the rapid rise in its price.

Mr. Sosland says that dairy cows must have bran in order to produce milk. In this he is mistaken, for thousands of cows have never tasted or seen bran. Cows in the West grow up on alfalfa hay and produce their milk on this feed alone. Without question, bran is a good feed. It is moderately rich in protein and contains a high percentage of mineral matter which is highly desirable for growing animals and milking cows. It is a splendid feed for lightening the meal portion of a cow's ration or for cows at the time of calving or when they are otherwise indisposed.

But cows can and do get along very nicely without bran. Its present price does not warrant its use, except for calves and cows that are not doing very well. Oats will take the place of bran and at 70 cents a bushel is a much cheaper feed. Further, alfalfa can be purchased at $38 per ton in the northern states and cheaper in the West and Southwest, making it a far cheaper feed than br at $50 to $60 per ton. Barley at $1.00 a bushel a much cheaper feed than bran.

The farmer who has been wise enough to provi himself with alfalfa or clover hay or any hay ri in protein need not concern himself about the hi prices of bran. His herd will get along very nice without it. Those who need more protein for b ancing their home grown feeds will find it cheap to buy gluten feed, cottonseed meal, oil meal, d tillers grains, or velvet bean meal, etc., than bra

THE FUTURE FEEDER

"What can I do?" said a secretary of a milk pr ducers' association, "to inform the members of o association regarding the proper methods of fee ing their herds? Most of them do not understa how to make a balanced ration for their cov They buy cheap feeds and feeds low in prote when they need high protein feeds to suppleme their home grown feeds."

Here is a situation that is hard to reach becau such men are not students of their business a they do not read to a purpose. There is no desi on their part for information. They are conte with themselves and the results they are getti from their herds. Little can be done for such me

Our hope is through their children. If th could be taught in school some of the simp truths of making rations, enough to crea a desire for more information pertaining to fee ing, we would have made a start toward solvi this perplexing question. School house clubs cou be organized and at the meetings of these clu the subject of feeding could be discussed. T children of the farm pave the way for obtaini knowledge of the proper rations to feed dai cows. It is necessary to create a desire for know edge before it is possible to acquire it. The bo and girls' clubs that are being formed in ma counties will pry open the minds of these you folks and make them hungry for knowledge. It through these young heads that agriculture w make her greatest progress.

THE COUNTY AGENT

The leading farmers everywhere appreciate t necessity and value of the right kind of organi tion. The days of individual effort on the farm a passed, and if agriculture is to make the progre necessary to keep in step with other industries, must be organized.

The county agent has been given a thorou trial, especially during the last year or two. I has made good. The work has progressed f enough to indicate clearly his duties and the se vice he can render his county. In the beginni the county agent's work was confined largely educating the farmer and rendering him an in vidual service, but it is realized the county agen field is larger than this and those who have be engaged in this work for a considerable number years appreciate the importance of occupying t larger field.

Mr. E. B. Heaton recently asked these pertine questions at a meeting of the National Associati of County Agents held in Chicago: "Is the coun agricultural agent to be simply the agent of an e ucational branch of our government, with the id in view of going out and educating the farme or is he to be largely responsible to the executi committee in charge of the local county assoc tion? Is it not a fact that we have been trying educate the farmer too much? Has not the ti about arrived when we should change our plans a methods of work in our various agricultural ins tutions and our governmental departments of ag culture? I wonder if the best type of county age is not that of a man who corresponds to the co mercial club secretary, so far as general conditio are concerned. This man must look after the ge eral interests of the county for which he work must study the changing phases of agriculture, market conditions, of organization methods a various other general propositions."

We believe Mr. Heaton has the true concepti of the duties of an agricultural agent. It would unfortunate if the educational part of the farm were neglected. We can never have too mu knowledge; on the other hand, it is possible to gi too much attention to the problems of the dai the soil, and the crops and disregard the relatic ship which the farmer bears to other branches industry.

We like the word "agent". It carries in meaning the duties of a county leader, a sup visor, as he is sometimes termed. Agent means o who exerts power, or has the power to act; one w

for or in place of another by authority from
one trusted with the business of another.
has been stated by Mr. C. B. Smith, in charge
xtension work in the North and West, that "the
ity agent as the joint representative of the ag-
ltural college and the U. S. Departme..t of Ag-
lture carries on his work according to plans
oved by these institutions. The active and in-
gent participation of farmers with the repre-
atives of the agricultural college and the U. S.
artment of Agriculture in formulating plans
res that the program agreed upon will be prac-
and workable as well as educationally sound."
e have long held the conception regarding the
of a county agent as expressed in the several
tions asked by Mr. Heaton. When every coun-
gent conceives and understands these princi-
, his work will be broader and more effective in
advancement of agriculture.

Breeding Sire to Daughter

have a herd of grade Jersey cows with a grand-
of Noble of Oaklands at the head of the herd.
it bring good results if I breed his daughters
im? If not, if I get another grandson of Noble
)aklands, half brother to the one I have, will
be all right? I have been informed that it is
good policy to change the strain of blood. Any
rmation you may be able to give in the matter
be greatly appreciated as I am young in the
se and do not want to make too many mistakes.
uncan, Ariz. A. D. C.

he method of breeding suggested would be
er inbreeding or line breeding. Inbreeding is a
mon practice among skillful breeders. It is
ugh its practice that desirable characteristics
nimals have been established and some of the
best animals developed. There is nothing
it inbreeding itself that breeders need to fear.
danger lies in mating animals having common
knesses. This, as can readily be seen, intensi-
the weaknesses as well as the desirable charac-
stics of the two animals.
breeding of pure-bred animals should be prac-
l only by men who have a thorough under-
ding of their animals, and know whether the
nals being bred have a common weakness. A
on who is a keen student of animal life can
tice inbreeding of pure-bred animals to splen-
advantage. But even such persons sometimes
re poor results.
is our opinion that there is very little danger
breeding a sire back to his grade offspring.
re are not likely to be any bad results from this
hod of breeding, and the chances are that it
intensify the blood of the sire, and this is de-
ble if the quality of the sire is good and the
nsification of his quality desirable. There are
petent breeders who do not advocate this prac-
of breeding a sire to his grade offspring, but it
practice that we believe on the whole gives bet-
results and that more good comes from it than
ring another bull. We would not hesitate to
the half-brother of the sire on either the pure-
l or grade heifers of this bull unless they have
e noticeable weaknesses in common that it
ld be undesirable to intensify.
here is also to be considered the small breeder
is not in a position to exchange his bull or is
financially able to purchase a new one of good
ity. In such a case it would be much more de-
ble to retain the bull of known quality than to
hase a sire of poor ability of nondescript
ding.
oncerning this practice, Professor Eckles of the
souri Station wrote us some time ago:
am aware that it is not always possible for the
er of a small herd to retain and use the old bull
if it is known that his offspring are high pro-
rs. I do not in general favor inbreeding to
great extent. However, if I had a bull known
e a sire of high merit I would not hesitate to
d him to his own daughters rather than to get
her, the merit of which I did not know. It is
known that inbreeding intensifies the charac-
tics of the animals mated. If they are defi-
t in any respect this is likely to appear even
nger than in the parents. If the animals are
g and vigorous and have the dairy character-
s wanted, the offspring are all the more cer-
to have the same if the parents are related.
Where the herd is large enough to make it prac-
, the thing to do in many cases is to keep two
or at least retain the bull after he is used un-
is possible to see how his daughters milk. Of
se, it costs money to feed an extra bull but the
hters may be enough better to pay the extra
nse many times over.
should say that the question of using a son
present herd bull would not be at all objec-
able provided his dam comes from a good
n of breeding and is herself a good individual and a heavy milker. In case the daughters of the old bull are also satisfactory, showing he is a prepotent sire, this would be a good plan to follow.

"Inbreeding is generally applied to the mating of animals within the first degree of relationship, such as parent and offspring, or brother and sisters. Line breeding is mating animals having the same ancestors but not so closely related; for example, the same grandparents.

Value of Skimmilk

Please tell me how to determine the market value of skimmilk, the price of butterfat and grain being known. The price of whole milk is not known. Just now the price of butterfat is 56c in the community.

Urbana, Ill. W. H.

There is no way of arriving at the value of skimmilk through butter prices or the prices of grain fed to the cows. Experiments in actual feeding have shown that 100 lbs. of skimmilk when fed at the rate of 1 pound of corn meal to 3 lbs. of skimmilk is worth one-half bushel of corn. If corn is selling at $1 a bushel, this will make 100 pounds of skimmilk worth 50c.

When fed to calves, skimmilk is worth more than this. We calculate that when grade dairy calves are selling at the age of six months for $25 that the skimmilk fed them returns us from 50 to 60c per hundred.

Marking Cattle

Kindly advise me what in your experience is the best system for marking a herd of pure-bred cattle so as to keep your records straight.

Jacksonville, Ill. A. L. F.

The tattoo method of marking has met with good success. Instead of using a numbered tag, the number is tattooed on the inside of the animal's ear. The method of tattooing is as follows:

The inside of the ear where the number is to be marked should be cleaned thoroughly. After this is done cover the spot with tattoo oil, using a small brush, and then cover the type with some of the same oil and make an imprint of the number desired. After this is done, draw the finger gently over the place to rub the oil in, but be careful not to rub too much or too hard, as this will start the blood. For making this number we have a pair of pinchers made with a slot in one end of the jaws into which we set type to make the desired number. The numbers are made of needle points and prick the ear when the pinchers are pressed together. Do not wash the ear after making the impression, but leave it alone for several days, when you will see the desired number very plainly.

After making one impression with any type, be sure that the type is cleaned before tattooing another calf to avoid carrying any infection.

Rate of Growth of Pigs

Will you please inform us about what you consider the proper weight for a pig between ten and eleven months old?

Detroit, Mich. A. C. M.

The pig does not make very rapid progress in live weight during the first 2 months. During the third month's growth, weight increases somewhat more rapidly and during the fourth month, there is a considerable increase. During the fifth, sixth, and seventh months, there should be increases of approximately 50 lbs. each month. Following the seventh month it takes 2 months to add 50 lbs. and the next 50 lbs. is put on in three months' time. As maturity is approached, it takes the pig 6 months' time to put on the last 50 lbs. in live wieght. Under usual conditions we would expect a pig to reach 200 to 250 lbs. at eight to nine months of age.

In discussing the breeds of swine, Farmers' Bulletin No. 765 says, "Poland-China pigs fed for market may be made to weigh 200 pounds or over at 6 months. At one year old males should weigh about 300 pounds, and sows 250 to 275 pounds. In breeding condition at maturity males should weigh about 500 pounds, and sows 400 pounds. Berkshire pigs at one year old should readily weigh 300 pounds. In breeding condition mature males should weigh about 500 pounds and sows 400 pounds. Duroc-Jerseys are similar to the Poland-China in size and conformation. However, at maturity, a boar should weigh about 600 pounds and a sow 500 pounds."

In discussing the size of breeding stock, particular reference being made to judging swine, an authority on this subject says:

"A mature sow should weigh about 400 pounds, and the male about 500 pounds. Gilts (young sows) should be well grown before breeding. As a result of breeding undersized young sows we can expect smaller pigs that probably will be lacking in constitutional vigor. As a guide or suggestion as to what pigs at various ages should weigh, the following is given:

"Pigs 10 to 12 weeks of age should weigh 35 to 45 pounds.

"Pigs 5 to 6 months of age should weigh 100 to 125 pounds.

"Pigs 8 to 9 months of age should weigh 205 to 240 pounds.

"Pigs 12 months of age should weigh 300 pounds or more."

Age of Bull for Service—Garget Remedy

How much can a well grown yearling bull be used in his first year of service without injury if he is well fed?

Do you think that a mixture of green buckwheat and millet would be better to put in a silo with green clover than clear millet and clover for August and September feeding to fresh cows?

I have found a remedy for garget that I have never seen discussed in your paper and it has helped me out of trouble several times. It is clear kerosene. I do not rub it in but apply lightly to the affected part. It never has failed for me.

Stamford, N. Y. E. B. F.

A well matured yearling bull may be allowed to serve at first one cow per week, service being increased, according to conditions, to two and in some cases three cows per week at two years of age. Professor Eckles advises that most bulls are sufficiently mature for light service at ten to eleven months of age, but it is not advisable to breed a bull to over five or six cows before he is a year old. From 12 to 15 months old he should not serve more than one or two cows per week. A well matured, well fed bull of over two years may serve 200 cows per year, but it is not only a question of the number of cows in a year, but also of distributing these cows throughout the year or reducing their number. As the cows in most herds are usually bred within a relatively short time of one another, one bull is not expected to serve for more than a herd of fifty cows. Feeding is often neglected during the breeding season, and this is particularly disastrous with the young bulls. Provide plenty of protein feed, plenty of exercise, and plenty of fresh air when the bull is doing heavy service.

We see no advantage in the incorporation of buckwheat with millet and clover silage unless thereby a larger yield of silage per acre will be secured. The difficulty of combining the three crops would be in having them all mature at the same time so as to permit of the ensiling of the combined material when each has its largest feeding value.

We have never used kerosene for the treatment of garget, except that years ago we used it (or axle grease) when the udders of the cows were caked. We thought at that time it was of some value, although it had a tendency to cause blisters to form on the udder.

Potatoes for Cows.—Pea Straw vs. Timothy for Horses

I have pea hay of unthreshed peas, (which would have made one ton per acre) timothy, and alfalfa. What proportion must I feed these to make a balanced ration? Must I feed grain with them? This is for milch cows.

What is the feeding value of potatoes for cows, either cooked or raw? How does pea straw compare with timothy for horses?

Mt. Vernon, Wash. B. W.

If there is sufficient alfalfa hay for the cows, we would not advise feeding them any of the pea straw or timothy hay. Cows do exceptionally well when fed no other feed than alfalfa. We believe that under ordinary conditions it is advisable to feed some grain in order that the cow may be properly nourished and that her milk flow be sustained and that adequate nutrients be provided for the growing of her fetus, but there are times when the prices of mill feeds are so high that it is more profitable not to use them.

Potatoes have a very low feeding value for cows. It is estimated that in normal times when silage is worth $2.50 to $4.00 a ton, potatoes are worth 15c a bushel. We would not use more than 20 lbs. a day if they are used at all. When potatoes are fed in large amounts, the butter is of poor quality; in other words, we would not look upon potatoes as being a very valuable feed for cows. They may be fed either cooked or raw.

Pea straw is, perhaps, as valuable a feed for horses as timothy hay. We have very little data to form an opinion upon this. If timothy hay is cut when it is in bloom, we look upon it as more valuable than pea straw, but if it is cut late when the seeds are beginning to form and ripen, then we believe pea straw is superior to timothy hay for the feeding of horses.

No Longer "Just Lumber"

The Long-Bell Lumber Company, the largest distributor of Southern Pine in the United States, announces that hereafter the product from its twelve great saw mills will be marked with this design

LONG-BELL

This progressive age demands named goods. Heretofore lumber has not been considered adaptable to trademarking, but this company believes that the public is as much entitled to know the identity of the manufacturer of the lumber it uses as the food it eats or the clothing it wears. It is no longer necessary to ask for "just lumber". Whether your requirements be large or small you may specify LONG-BELL brand with the same assurance and satisfaction that accompanies the purchase of any commodity that bears the maker's guarantee in the shape of a trademark.

Every farmer will be interested in our Free book on Permanent Farm Improvements. *Write for it today.*

Ask your dealer for Long-Bell brand lumber

Impressions of the New York Milk Strike

[Continued from page 902]

ular hurry in advertising our own expenses and troubles to the consumer.

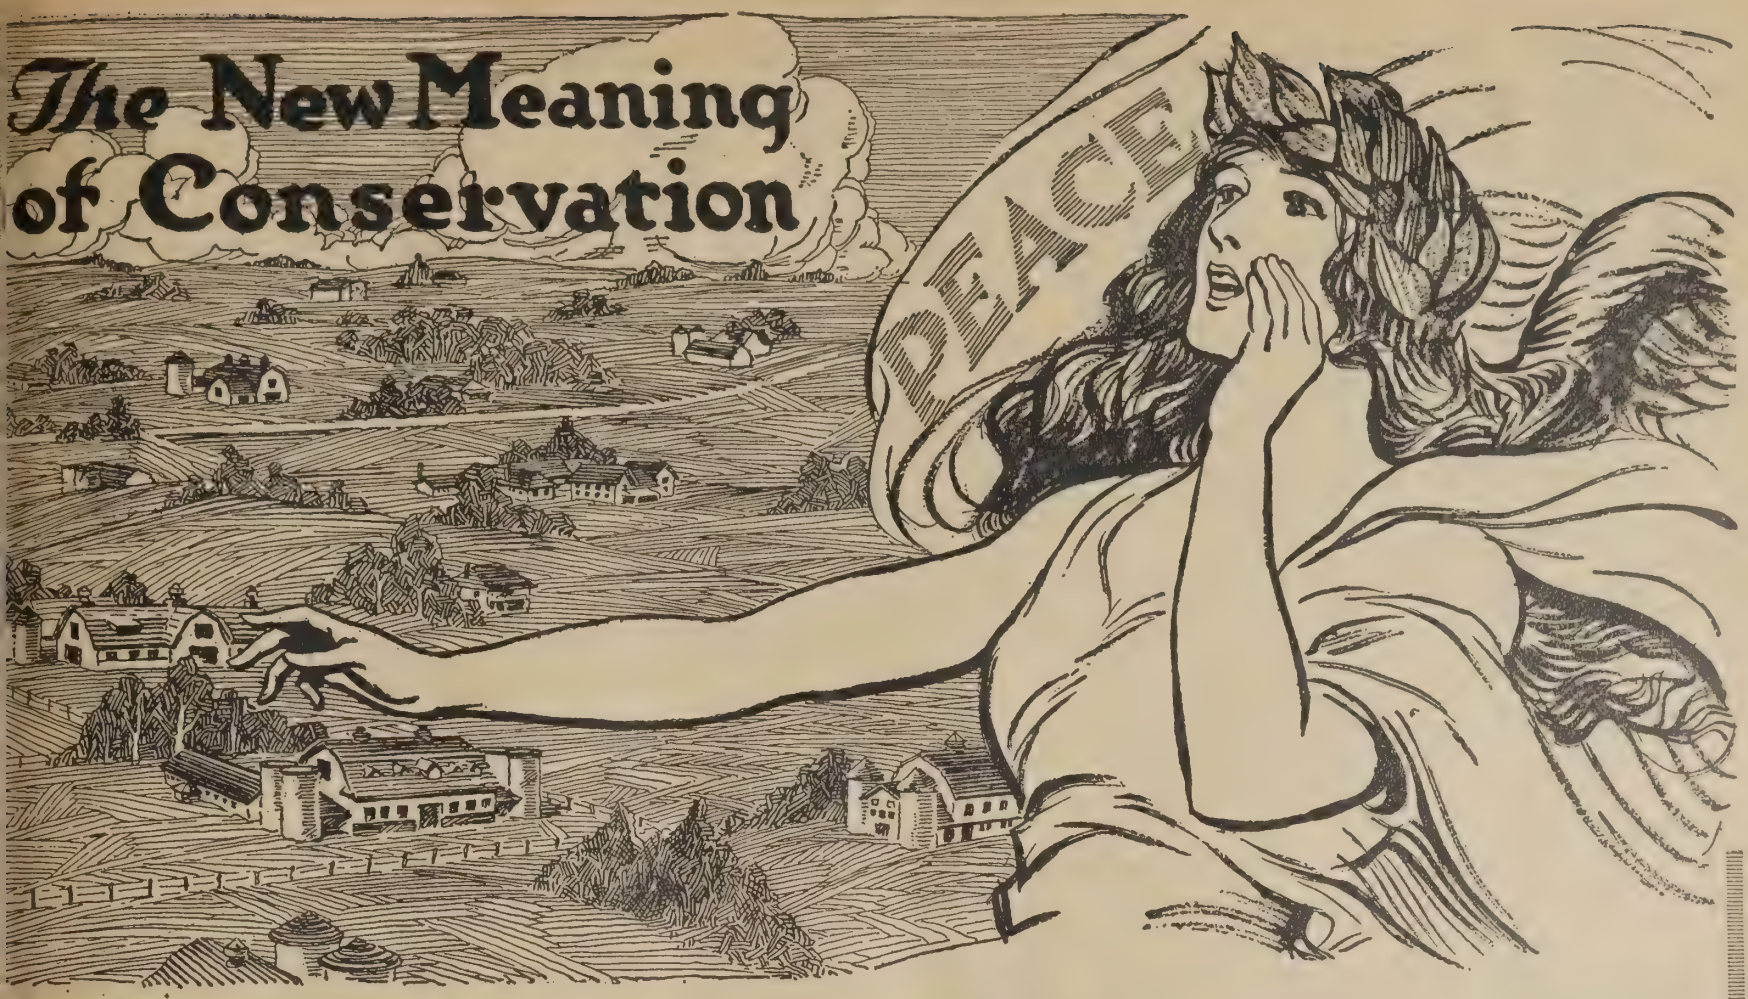
If we do win this strike in its entirety, it seems to me that even the most conservative must be persuaded that something must be immediately done to counteract the powerful forces arrayed against us, or we may as well go under first as last, as we can't stand these sudden onslaughts forever. It seems to me as if the present situation proved that a fortune at last must be spent in educating the public that, to produce milk, the producer had got to be paid a living wage and enough besides to finance himself. This the public is unwilling to do—preferring to believe that we are all black in demanding excess profits as the dealers and their underlings would paint us.

The New York consumer considers us his enemy, notwithstanding the fact that every four out of ten of its millions came from a farm and know in their hearts that we never even began to dream of profiteering and never will. If they would let sane reason guide them instead of listening to the dealers and middlemen who deceive them and live fatly off their credulity, they would see that those hill-farms all over America must finally demand their share of the milk-dollar, and must band and organize and stand together—or never dairy again.

I wonder if, in any other great industry, the receivers and distributors lie awake nights to plot against the producers themselves and can always be counted upon to array themselves against those to whom they owe inflated stocks and enormous and powerful interests. Such a situation must be impossible and unparalleled in the business world. Can we allow it to go on forever?

The Bordens and kindred companies are shipping milk in to the city from western states and are promising "quick relief" to their misused patrons!

Everyone knows that there is a shortage of milk since Europe has put in her bid for each ounce of our surplus, so I am not greatly worried that the West will care to cater forever to the fickle Bordens and the city which has billions for luxury and lust, but not one cent above starvation price for the dairymen who have served so long and faithfully without decent recompense.



We have got to take steps in earnest now to protect ourselves, and the surest, quickest, but most expensive way would be to free ourselves once for all from the tyranny of the dealer and the politician. If we can't see our way clear to taking such a radical step too suddenly, we had better take steps to perfect the proposed national organization and put our industry on a plane where it can't be tampered with by every Tom, Dick, and Harry.

It is certain that we can't stand these strikes forever as their only fruit is a temporary victory which leaves a bad taste in the consumer's mouth.

As long as we are practically friendless in New York, and will be until we make the long green talk as it has never talked for us before, we may as well make up our minds to wars and trouble and hatred and suspicion on the part of our legitimate market.

It seems the irony of fate that we have taken losses so consistently and uncomplainingly, yet like the man in the immortal story, we are in a go-

(Continued on page 910)

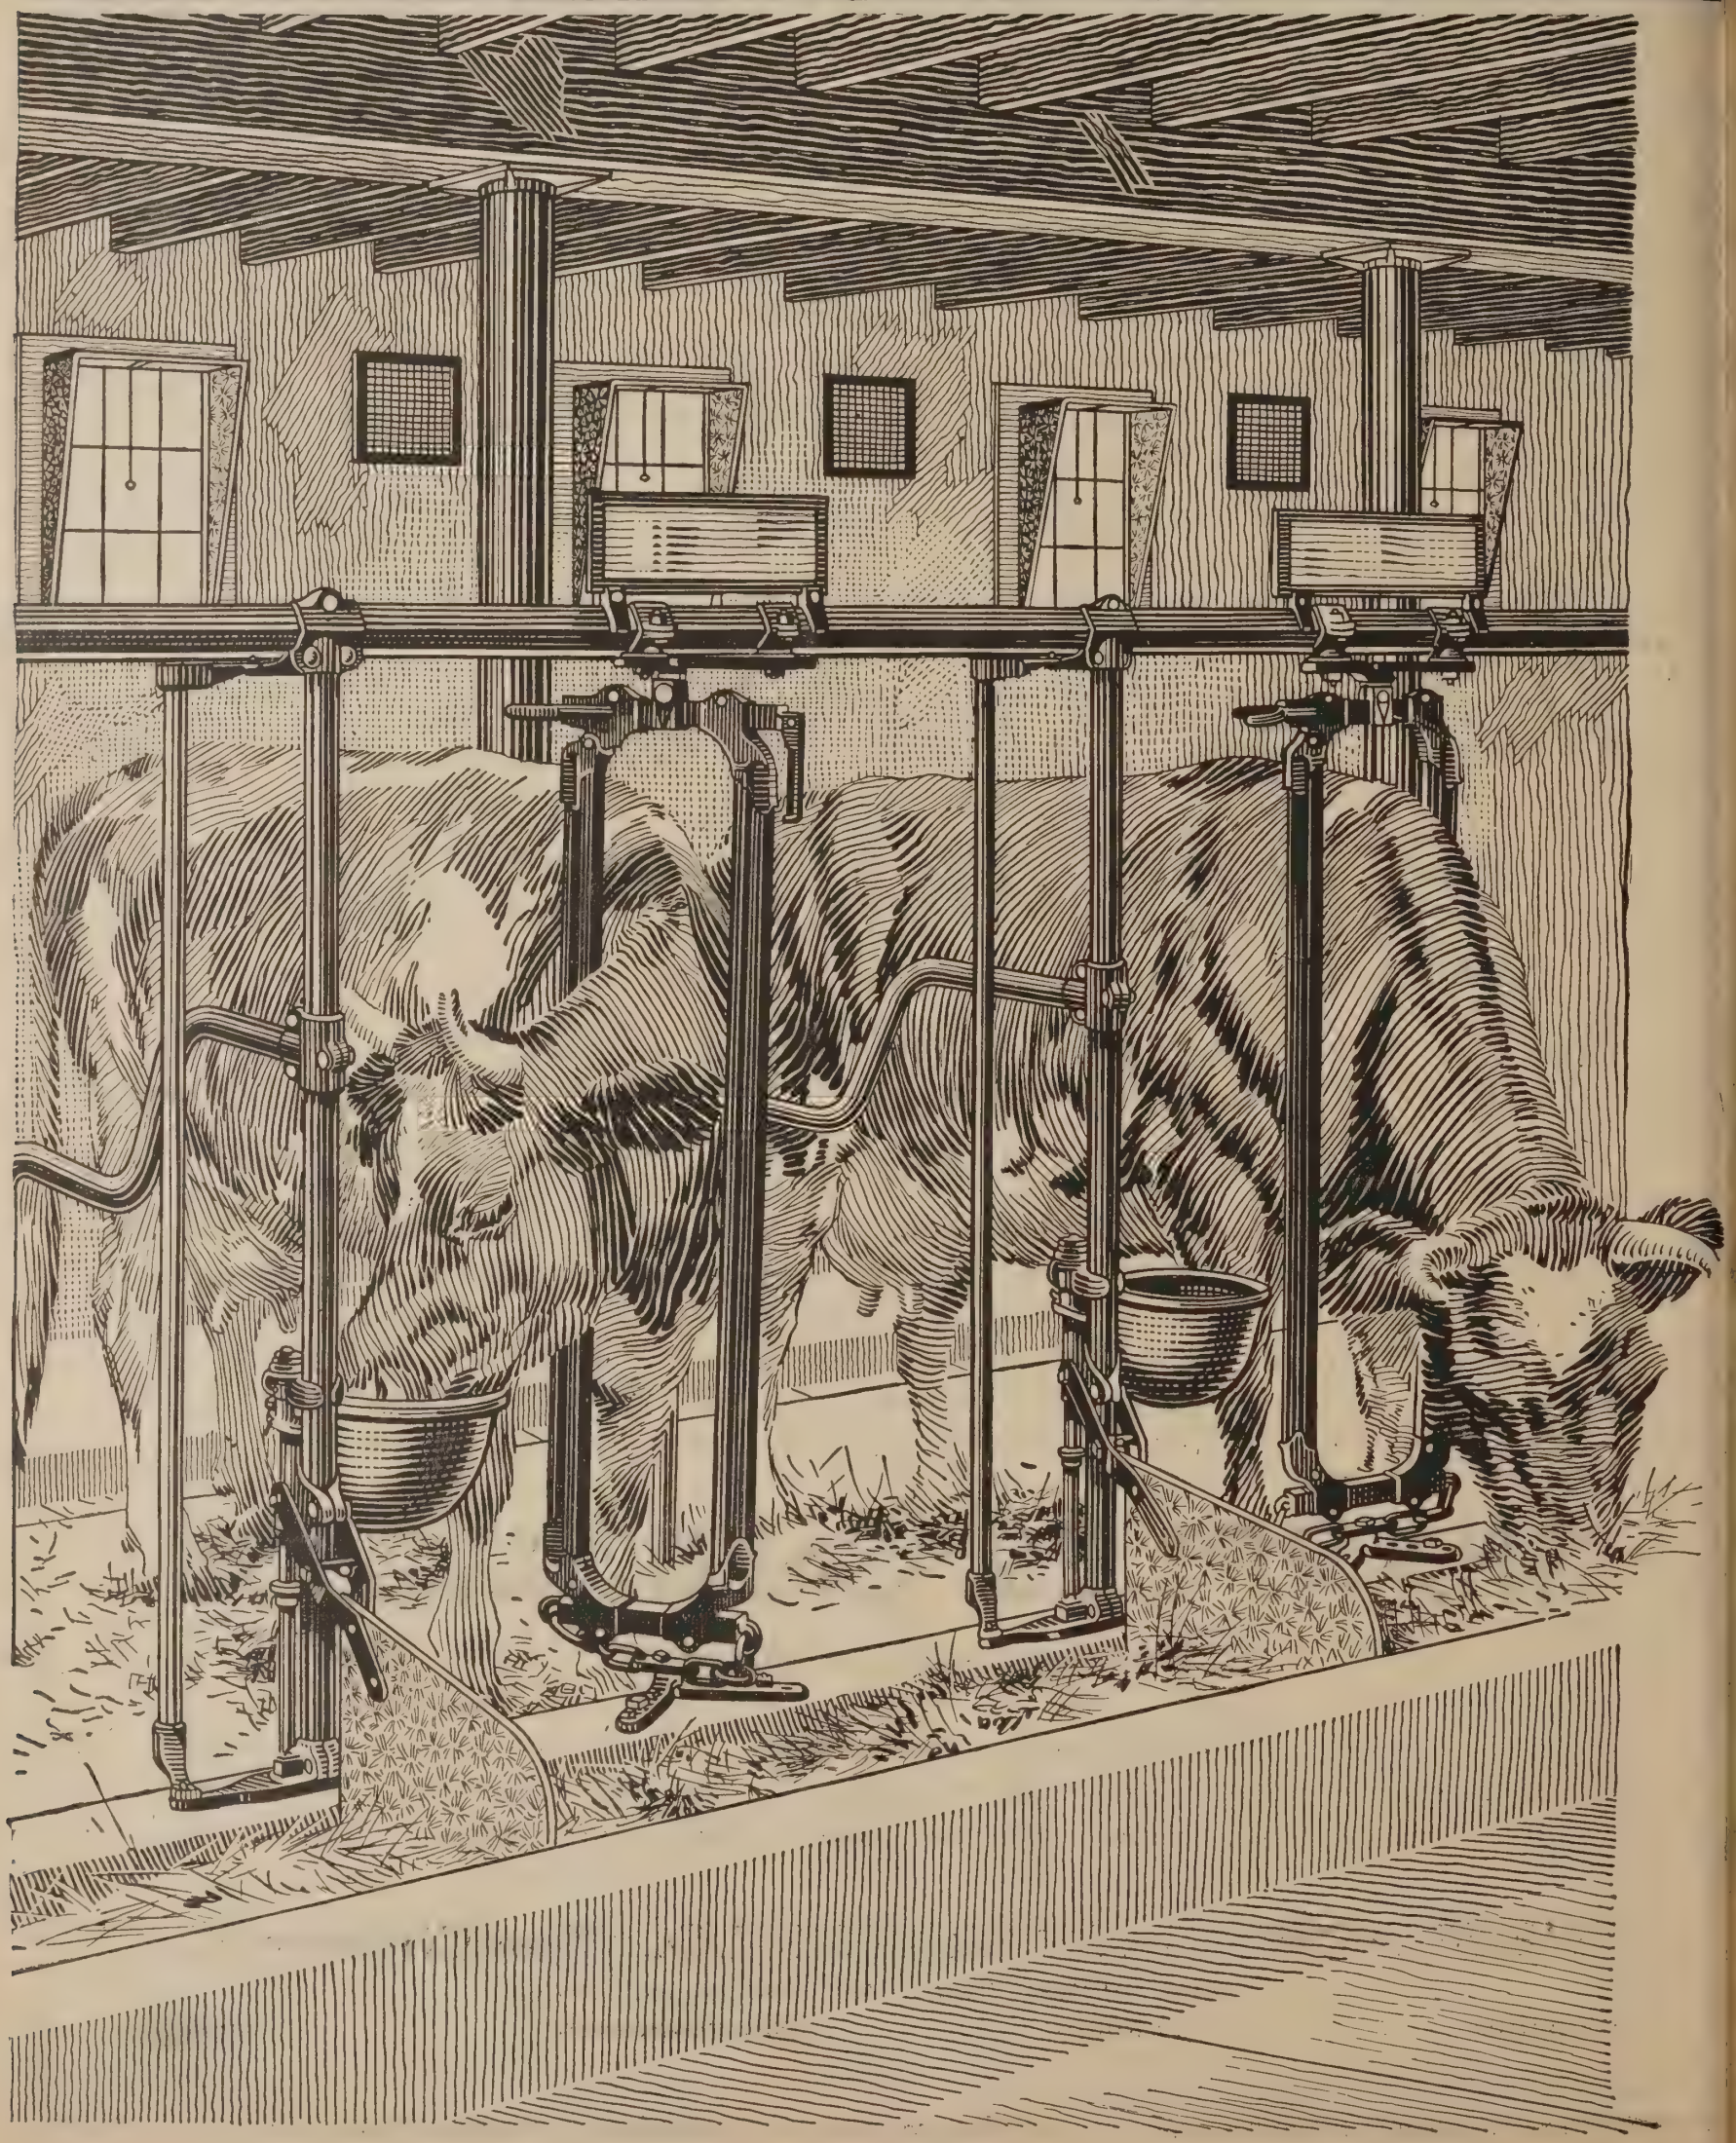
The Greatest Hour of the Dairy Farmer

NOW that the war is over, the farmer's responsibility and opportunity is greater than ever—for the American farmer and dairyman must literally feed the world. It means greater production and getting the ***most*** out of that production. Waste is as unpatriotic now as it was during the war. But there is many a farmer who would not think of planting a hundred rows of corn and only harvesting 95 rows, who is now using a fixed feed separator and wasting a good part of his butterfat through turning under speed. Even tho the proper separating speed is marked on the handle, tests show that 95 per cent of ***all*** separators are turned below speed. If you turn a Sharples Suction-feed Separator below speed, you skim clean just the same—due to the patented suction feed. No other separator has this principle.

SHARPLES SUCTION-FEED CREAM SEPARATOR

"Skims Clean at Any Speed"

Sharples is the pioneer American Separator—invented, perfected and preferred in America. It is the product of the greatest factory of its kind in the United States—and all American owned. Write for the interesting, profitable Sharples story. Address nearest office, Dept. 10.



THE SHARPLES SEPARATOR CO., West Chester, Pa.

James Cups

Make More Milk

The simplest, cheapest means of making more milk is ofttimes disregarded. Many overlook the necessity of water—a milk maker that costs almost nothing.

Milk is 87 per cent water. Most cows need two to three pounds of water for each pound of milk yield. Are you sure your cows are getting enough water?

Those who realize how greatly milk flow is increased by the use of James Cups, permitting cows to drink all the water they want, when they want it, whether day or night, are making ten dollars, fifteen dollars, even twenty dollars and more per cow extra profit this winter.

And they are doing this merely by giving their cows all the water they want. Water costs but little. Feed costs—well it costs a-plenty.

How wonderfully James Cups increase dairy profits is revealed by a recent investigation among farmers using James Cups. They know.

A questionnaire was sent out to which 120 replies giving definite information were received. These replies came from the practical farmers, the average herd was 24. Five herds had less than 10 cows; 61 had 10 to 20 cows; 27 herds had 21 to 30; ten, 40; four 41 to 50; six 51 to 100. 108 said that James Cups increase milk yields; only five said "No".

In response to the question, "Do the cups save you time and labor" ALL said "Yes".

108 claimed the cups saved fuel through not having to use tank heaters. Six said "No".

Answering the question, "Have you observed that your calves grow better and faster by having a constant supply of water before them?" 80 answered "Yes" and seven said "No".

5 claimed that cups help prevent ead of disease with nine taking the negative side of this question.

9 gave definite figures on increased k yields.

8 reports were based on milk recs. Of these, one reported an inase of 5 to 10 lbs. per cow per day; r report an average of 4 lbs.; three te 3 lbs.; five say 2 lbs.; three 1½ lbs.; ¾ lb.; one reports $8.56 increase cow per year; one $5.00; one $10.00; received 3 per cent increase; one 8 cent; two 10 per cent; one 12½ cent; one 20 per cent; one 33⅓ per t; and one exception proves the e by answering "not much".

These 28 reports cover 759 cows. Assuming 16 lbs. daily as an average milk yield, and $3.25 per hundred as the price of milk, the average increase per day for each of the 759 cows is 2.45 lbs.

The 41 reports not based on milk records check out about the same, the average being 2.52 lbs.

The average of 99 reports answering the question, show a daily saving in labor time of 3½ minutes per cow, a total of more than 10 hours labor time in a 200-day season, which at 25c an hour only, makes more than $2.50 saved per cow yearly.

The average of the 61 reports answering the question, show a saving of fuel of 56c per cow per winter.

Assuming only 2 lbs. per cow daily as the average of increased yield, this would total 400 pounds during the season; which at $3.50 per cwt. amounts to $14.00.

The total saving in labor and fuel and the increased milk yield, figured conservatively, thus adds over $17.00 to the profits from each cow.

The above results are confirmed by an investigation of The Farmer, St. Paul, Minn., published in its issue of Nov. 1, 1918—and by the experience of many others.

If you wish more complete details of the James investigation, of the St. Paul Farmer report and of the experiences of dairy farmers as to the increase in milk yield brought about by the use of drinking cups, write us for our Bulletin No. 4.

TURN WATER INTO MILK

Four Pounds Daily Increase
Hoard's Dairyman, April 5, 1918, under the heading "Cow Testing Association" reports from the Chehalis District, Washington: "One man installed individual drinking cups and the daily milk flow immediately increased nearly four pounds per animal."

Four Pounds Per Day
W. H. Martin, Herdsman, Arcady Farms, Lake Forest, Illinois: "According to our milk record James drinking cups increase our milk yield four pounds per cow per day."

Two to Four Pounds
Curtis O. Merrill, Framingham, Massachusetts: "Our milk records show that James cups increase the milk yield from two to four pounds per cow per day."

One Quart Per Milking
Mary Hamlin, Amagansett, N. Y. "My milk yield increased one quart per cow at each milking after starting to use the James cups, due in my opinion to their use. These figures are shown by my milk records."

20 Per Cent More Milk
C. E. Erickson, Rosholt, Wisconsin. "My milk yield increased after using James cups 20% as shown by milk records."

Three Pounds Per Cow
L. S. Duggan, Gainesville, N. Y. "My tenant says the James cups increased the milk yield thirty pounds a day for ten cows, this being shown by the records."

20 Per Cent Increase
D. D. Decker & Son, South Dayton, N. Y. "We find the milk yield increased 20% as a result of using James drinking cups."

Three to Seven Pounds
Wm. P. Wernett. Plymouth, Mich. "Our watering outfit is very satisfactory and since being installed our cows have gained from three to six and seven pounds of milk a day for each cow."

Put in James Cups Now

You are losing money every day without them. You are wasting fuel, during unnecessary disagreeable tasks in watering out of doors and subjecting your cows to danger of spread of disease.

It is during the next few months you will enjoy the cups the most, and it is right now that you have the leisure to put them in. The installation is simple.

Write us today for an estimate of what a James Drinking Cup outfit will cost for your barn; and if you doubt whether the cups will do for you what they have done for others, ask also for our FREE TRIAL OFFER.

Flush Cows After Calving

Protect your herd against Contagious Abortion and Barrenness.

Barrenness or Sterility, like Abortion, Retention of After-birth and Premature Birth, is nearly always caused by infection of the reproductive organs by the germs of Contagious Abortion. Unless this infection is promptly overcome by the use of a powerful but safe antiseptic, it may permanently affect the reproductive organs so that the cow will continually fail to stick.

Every time a cow drops a calf—whether alive or dead—by premature birth or aborting, whether the after-birth is retained or not, her reproductive organs should be flushed out, because that is where the infection is developing.

B-K, the powerful non-poisonous antiseptic, is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidence" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name

After Calving

Every Cow Should be Treated With

Hood Farm Breeding Powder

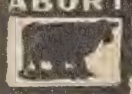
It cleanses, disinfects, causes the cow to clean quickly and breed readily. It is a safeguard against Abortion, there is less use of the bull, and calves are stronger.

We quote what Mr. H. F. Weaver, of Millard, Wis., says:

"I have used your Breeding Powder for about four years with very good success. I think if every dairyman made a practice of injecting every cow three or four times after calving there would be very few barren cows."

Treatment of all cows with Hood Farm Breeding Powder is the most profitable and economical thing you can do.

Mail an order today, mentioning this paper.



Prices, prepaid, $1.15, $2.75 and $5.00. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75.

C. I. HOOD CO., Lowell, Mass.

Impression of the New York Milk Strike

(Continued from page 908)

way to please no one and lose our ass in the bargain.

How can we rid ourselves of the real wolf in sheep's clothing—the unscrupulous and wily receiver? It is him we mainly have to thank for the sorry mess we find ourselves in now and he will always be snapping and biting at our heels, sowing distrust of us and putting us in the wrong with our market.

This war hasn't ended yet, and the longer it continues, the more we are goaded into fighting for dairy justice.

There is a twisting, turning road ahead of the American dairyman and he must needs marshal all his courage and strength of purpose to finally win out. It all takes time, but there is no excuse in letting events or actions take too much time now that we realize freshly that we must fight every inch of the way to secure fair prices and keep them.

Every maker of milk is enlisted and his help and faith in ultimate justice is sorely needed.

Able leaders are vital to lead us safely through—men who are big enough to insure and satisfy the rights of both producer and consumer. As for the dealers and such who have tried to sell and betray us, let them find other pastures in which to prey. Haven't we had almost enough of them? HELEN S. K. WILLCOX.

New York.

The Hornless Holstein Farms

are consigning to the

Liverpool Sale about a dozen royally bred naturally hornless Holstein heifers

mostly two-year-olds. Some of them out of dams and grandams with splendid Semi-official Records and by sires whose dam and grandam had high Semi-Official Records. Bred to a son of the world's record senior four-year-old. 1294.7 lbs. of butter in a year. A bull whose 3 nearest dams averaged 20,000 lbs. of 4% milk in a year. Naturally hornless bull calves sired by him are offered at from $100 up. Catalogue of service bulls with prices on application.

We are also consigning the same number equally as well bred, to the Pennsylvania Breeders' Sale to be held at Harrisburg, January 23rd.

George E. Stevenson & Son, Clarks Summit, Pa.

The Pennsylvania Holstein-Friesian Association will hold an auction of

Registered Holstein-Friesian Cattle

At Keiffer's Stables, Middletown, Pa.

THURSDAY, JANUARY 23rd, 1919

All of these cattle are cattle of excellent individuality, breeding and records, and the sale includes daughters and granddaughters of King Segis Pontiac Alcartra, Judge Hengerveld De Kol and Hengerveld De Kol. A large consignment is from the herd of Mr. Geo. E. Stevenson of Clarks Summitt, Pa., who has specialized upon developing his cattle on the year's test. Other consignments are from the herds of Messrs. Miller Bros. and Ressigie and several local consignments. The sale will begin at twelve noon. All cattle in the sale will have been tuberculin tested.

Catalogue mailed on application to any address by

Eugene B. Bennett, Hotel Columbus, Harrisburg, Penn.
Geo. Baxter, Auctioneer. Mr. S. T. Wood in the box.

Catalogues will also be on hand for distribution seven days before the sale at Keiffer's Stables, Middletown, Pa.

Son of a 19000-Lb. Cow For Sale

A grandson of Pontiac Korndyke.

His sire, Prince Korndyke Boy, is one of the good sons of Pontiac Korndyke and a grandson of Dutchland Sir Pontiac Rag Apple.

His dam, see illustration, is a sister of Tie Tietje Queen De Kol. She has a 365-day record of 19,079 lbs. milk and 794.25 lbs. butter.

The calf was born May 12, '18, is a very good individual, well grown, large enough for light service and well marked.

ALEX CHAMBERS, - OWATONNA, MINN.

"Quick delivery on Goodyear Pneumatic Cord Truck Tires has enabled us to get better prices for perishable fruits and vegetables. Other farmers in this section are adopting these tires as a result of our experience with them."—B. and J. D. Park, Fruit Growers, Provo, Utah.

AS this statement indicates, Goodyear Pneumatic Cord Truck Tires have ade it possible for these farmers to re- ize larger profits in the marketing of ily spoilable produce.

Their 160 acres are located in the Wasatch Mountains and the nearest stomers live 40 miles distant, at Park ty, Utah.

Solid-tired trucks frequently stall under ch conditions as are found on the d up-and-down route between farm d town.

Horses require three to four days to ul one load and return.

But, during the 1918 picking season, either of two ¾-ton trucks, shod with Goodyear Pneumatic Cord Truck Tires, made the hard 80-mile round trip almost daily.

Fruit and vegetables gathered in the afternoon were sold the following morning in Park City.

The ground-gripping Goodyear Pneumatics constantly have carried full loads at good speeds over the rock-strewn mountain roads. They have climbed grades ranging to 23 per cent and have traveled through passes 9,000 feet in altitude—sometimes choked with mud or snow.

And these tires have delivered mileages up to 16,000 in this gruelling service.

Naturally records like this point farmers to the advantages of Goodyear Pneumatic Cord Truck Tires for the delivering of other perishables, such as dairy products, especially under changing weather conditions.

The Goodyear Tire & Rubber Co., Akron, O.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Bob Attends a Meeting of His Club

"SAY, mother, I just wish you and dad could have been at our meeting tonight," shouted Bob as he rushed breathlessly into the house. "We had such a good time. Every member was there excepting Slim Taylor, and he couldn't come 'cause he's got an awful cold."

"Bob, I wish you wouldn't call George, Slim. It doesn't sound very nice."

"Ah, that doesn't make any difference, mother! George doesn't mind that, anyway he never says anything to me. Some of the boys even call him Skinny. What's the odds; he's thin as a rail and he knows it. Boys like nicknames, don't they, father?"

"Sure they do," replied Mr. Ramsay."

"Didn't you ever have a nickname, dad?"

"Well, I guess I did. All the boys used to call me Dumpy."

"Oh, how funny to call a lively fellow like you, dad, by that name. Names don't cut any figures, do they, dad? It's the kind of fellow you are that counts. Guess you are beaten, mother. Father and I are against you this time. But you are usually right, mother," and at that Bob slipped over to his mother and planted a boyish kiss upon each cheek. "There, that ends the argument."

"Bill Reed, our club president, is a cracker-jack! He handles one of those meetings better than lots of men could. He isn't at all afraid, and tonight we had two visitors. One was the state club leader and the other, a fellow from Washington who travels all over the North and South helping in this club work. Bill was just as cool, though, all through the meeting. I'm going to try to get elected president of the club some day. It's great experience.

"And the way he put us through parlimentary practice! We just tried to ball him all up, but he straightened us out every time. This club is going to make some record with a fellow like Bill at the head. Roll call was lots of fun. When our names were called we each had to tell something about the progress of our work."

"What did you say, Bob?"

"Oh, I told them that Betsey was getting skimmilk now and that she was starting to eat grain and alfalfa hay. Jimmy Greene tried to get into an argument with me as soon as I mentioned alfalfa. You know Mr. Greene tried to raise alfalfa once and it all died out the first winter. Since then all of the Greene are death against alfalfa, and they say clover hay is better. I didn't argue with Jimmy but some day I'm going to get at him right. Just wait till Mr. Anderson takes up alfalfa in our agricultural class; we'll fix Jimmy once and for all on that subject."

"Oh, they'll try alfalfa again, Bob, don't you worry. Mr. Greene doesn't want anybody to do things he can't do. Why, he told me just last week he was going to try it again next spring and that he had already spoken for some of the highest priced seed. I think he said it was Grimm."

"That's our kind, father."

"Yes, it is, and that is one reason I'm so successful with my alfalfa. Grimm doesn't winterkill as easy as some of the others."

"When we have our alfalfa program, dad, you and mother have got to come. We are going to get a speaker from the agricultural college. Our secretary has already written down there for one. I hope Jimmy brings his father to that meeting. Maybe they'll both learn something they don't know yet about alfalfa growing."

"By taking roll that way, we each learn something about the other fellow's work. We ask questions and sometimes we get into some hot discussions about our calves. I'll bet it took us twenty minutes tonight to get through with that part of our program."

"Mother, you always enjoy singing. You ought to hear us sing our club songs. Clem Johnson leads us and the way he gets away, you'd think he took lessons in directing under Sousa. That singing class that Miss Jennings organized in school helps us a lot, too. Some of the boys are singing bass. The way we sing, I really think we like to hear it ourselves."

"Our regular program was short tonight. Frank Rice read a paper on Winter Dairying. 'Twas pretty good, too. I'll bet his dad helped him with it. He surely said great things about properly caring for dairy cows in the winter and that to do the job right you've got to have a silo. He looked square at Arthur Meyer when he said that. I felt kind of sorry for Arthur, because they don't have a silo."

"Yes, but Jim Meyer knows how to get milk from his cows just the same," replied Mr. Ramsay. "He's a very good feeder."

"What was the agricultural man from Washington there for, Bob?" asked Mr. Ramsay.

"Oh, he and the state club leader just happened to be up here in this section of the state and I guess they found out from Mr. Anderson that our meeting would be tonight. Gee, he is a smart fellow, and you ought to see the boys hang around him after the meeting. That's why I was so late getting home.

"And, oh, he gave us the dandiest talk about boys' and girls' clubs. Remember, dad, you didn't care about my going into this calf club contest. Wish you could have heard that fellow talk. Guess you and mother will open your eyes at some of the things I am going to tell you he said. He started out by saying: 'This is a clubby age we're living in, social clubs, agricultural clubs, and baseball clubs.' He made a hit with us right from the start. How Joe did laugh when he mentioned base-ball clubs. You know Joe would rather play ball than eat. I really believe his Mary Jane Spot would suffer if there were many more ball games played here."

"Well, that Washington fellow said: 'That of all the clubs he knew, these agricultural clubs were the most important,'" at which remark Mr. Ramsay winked slyly at his wife.

"Oh, you needn't wink at mother, dad, because he's got the figures to prove what he said. Now you listen to this," as he took from his vest pocket a small note book which Aunt Ella had given him for his birthday. "Last year there were enrolled 800,000 members in the agricultural clubs of the North and West alone. The results of their work added nearly $20,000,000 to the nation's resources. According to the reports of the members, each one produced $21.89 wor of food among which he mention corn, potatoes, beans, eggs, butte honey, pigs, beef, fruit, and jellies."

"He must have included the girls those figures, Bob," spoke Mr Ramsay."

"Sure he did. What of it? We cou on the girls, too, in this work. Wh they are doing as much as the boy Jennie Meyer, Arthur's sister, to me yesterday that she sold $25 wort of canned fruit which she put up he self.

"Oh, yes, and in the South alo there were 115,000 boys enrolled clubs. They produced about $4,500 000 worth of food. Now does th prove his first statement, dad? We getting stronger every year and we only just started, too. And wh shouldn't we? The only qualificatio we have are youth and energy ar every boy and girl has those. Whe they once get a taste of club wo they will never let go."

"They won't if they are like yo Bob," added his mother. "And I thin they are a splendid thing for the boy and girls. Besides learning a grea deal you get a lot of enjoyment out doing things for yourselves."

"And now, Bob, since you are suc a club enthusiast this will add to you interest," continued his mother. "Th afternoon I organized a sewing clu among the girls of this neighborhoo and I am going to be the local clu leader."

"Hurrah, for you, mother! Won you make a dandy leader? You kno so much about sewing and everybod loves you. I'd say these girls ar pretty lucky to get you, wouldn't yo dad? Say, dad, now you are left in th cold. You've just got to do what th boys asked you to. Yes, and I hear Mr. Anderson teasing you, too."

"What's that, Bob?" asked Mr Ramsay.

"Hasn't dad told you? Why th boys want to form a pig club an they want dad to be their leade What do you say, father?"

"Oh, I may try it, Bob, after think it over a little while longer."

"Won't that be great! The whol Ramsay family doing club work shouted Bob, and with that he scamp ered up to bed.

As soon as Bob had gone, M Ramsay drew from his pocket a shee of printed matter telling how to for a successful club. Spreading it ou on the table before him he began t study it.

"Mother, I suppose you had a pla like this to guide you when you or ganized your sewing club among th girls?"

"Yes, I did, John. The state clu leader for girls furnished me with copy. You'll remember we met her last winter at the Community Clu Picnic."

"Well, I guess I might as well g ahead and help the boys out."

"I would, John. 'Twill mean s much to them, and Bob is so wild ove the idea. He will be greatly disap pointed if you refuse."

"This is the copy of the plan fur nished by the state club leader:"

How to Form a Successful Club

1. THE LEADER
   (1) Conducts first meeting of or ganization and sends in th club enrollment blank to th state leader. The material fo club work is then sent to him.

TWO CALF CLUB ENTHUSIASTS

THE BUENA VISTA COW TESTING ASSOCIATION CALF CLUB

a. Subject
1. Select as to the season and needs of the times, of the community and the members.
2. Outline
Winter—Calf Club, Pig Club.
Summer—Corn Club, Garden Club, Canning Club.
b. Plan of Work
The club work may be carried on by any of the three plans offered. Each project must be finished and the record approved before the club may start a new one. STATE CLUB LEADER.

Junior Letters

Hoard's Dairyman Juniors:—I received the watch fob, button, and creed and think they are fine. I have my creed framed.

I am 12 years old and in the second year junior high school.

We live on a farm of about 1,000 acres. Papa has a tractor. It works fine. He used it to run the ensilage cutter this fall and mother drove it on the hay fork in the summer.

Have any of the junior girls ever done demonstration team work? Two of my friends and I gave a demonstration of packing fruit and vegetables for parcel post shipment at Rutland County fair. We received first prize which was an auto ride to Burlington and a visit to the state college. We wore the blue food conservation uniform.

I must close as my letter is getting long. My address is R. F. D. 4, Brandon, Vermont, if anyone cares to write to me.

Beatrice Seager.

Hoard's Dairyman Juniors:—How are all of you getting along? Papa bought another sow. She had 10 pigs; she killed three and the rest of them are doing fine. The other sow had 12. Papa gave me one but it died one night. Another one got cold. Papa gave it to me and it is doing fine. We have not had any snow yet. I have caught only seven rabbits. My colt is doing fine.

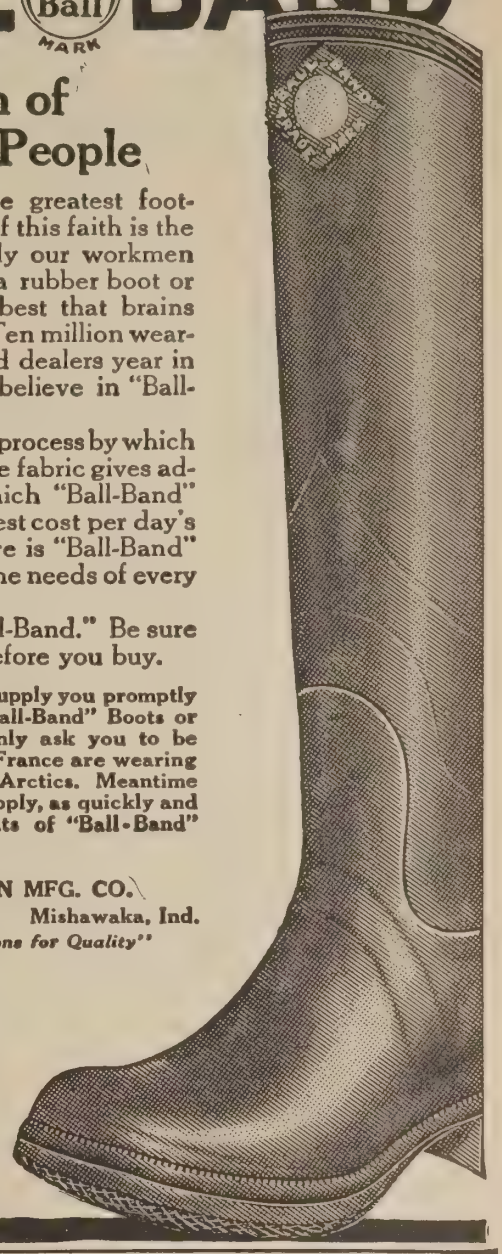
I will close wishing the juniors good luck.

Missouri. Earl Hillhouse.

"BALL Red Ball TRADE MARK BAND"

The Faith of Ten Million People

proclaims "Ball-Band" the greatest footwear in the world. Back of this faith is the supreme quality which only our workmen know how to build into a rubber boot or shoe. We've made it the best that brains and money can produce. Ten million wearers and over sixty thousand dealers year in and year out stick to and believe in "Ball-Band."



Our own special vacuum process by which the rubber is forced into the fabric gives additional endurance for which "Ball-Band" is noted. You get the lowest cost per day's wear in "Ball-Band." There is "Ball-Band" Rubber Footwear to meet the needs of every member of your family.

Ask your dealer for "Ball-Band." Be sure to look for the Red Ball before you buy.

If your dealer is not able to supply you promptly with the particular type of "Ball-Band" Boots or Arctics you desire, we can only ask you to be patient. Many of our boys in France are wearing "Ball-Band" Rubber Boots and Arctics. Meantime we are doing our utmost to supply, as quickly and as fully as possible, the wants of "Ball-Band" wearers at home.

When Writing to Advertisers, Mention Hoard's Dairyman

Mange of Hogs

HOARD'S DAIRYMAN:—Despite thick and rather tough skin the l bothered by a number of skin eases, some of them being of a ous nature. Any one who has h hogs attacked by true mange agree that it is hard to cure and ries the animals to such an exten they can hardly make any There are two skin diseases diff considerably that are both kno mange. One of them is the mange caused by a burrowing site and the other is known as mange.

Pitch mange is caused by ge uncleanliness around the pens lots. It attacks hogs that are no ticularly vigorous and thrifty such animals are kept in bad roundings. Damp floors covered filthy bedding and wet pens there is never a clean-up of the and dirt will help much in startin trouble. Some of the lighter sk breeds seem very liable to co the pitch mange. It is really a s an eczema rather than a mang tender skinned hogs of the breeds are very susceptible to first the skin will become reddene sometimes a slightly swollen ap ance will be noticed in places. next thing that will be noticed great number of little red spots a a little while these will turn into ters. For the pitch mange abou best treatment is to give the hog and surroundings a thorough cle After the clean-up follow the of simple cleanliness and fee hogs with the idea of making thrifty and vigorous. The right of treatment usually means a c plete change of surroundings plenty of good feed.

True mange is a different tr altogether. It is caused by a m animal parasite that digs down the skin. It is somewhat like th mite that attacks humans and c a very severe inflammation a scratching. Hogs that are in with these parasites will scratc rub the irritated parts so vigo that the hair will disappear an affected parts will become rav red. This kind of mange is very to cure because of the burrowi the parasites beneath the skin they cannot be reached by any nary treatments. True mange h usually somewhere on the he neck and moves slowly backwar the body of the hog until the surface is affected. The hams ar ally about the last parts of the to be attacked by the spreading sites. Hog mange is peculiar be of the powder-like surface o crust that forms over the irr parts. As it spreads and be more serious the bristles fall ou the body surface becomes bare. Sometimes the skin is thic to an astonishing extent becau the continued irritation and infla tion. It always becomes very h and has a wrinkled look that is that caused by any other skin di When hogs are attacked by this dy it is better to call in a veteri than to rely upon home treatm

Things We Like To Talk About

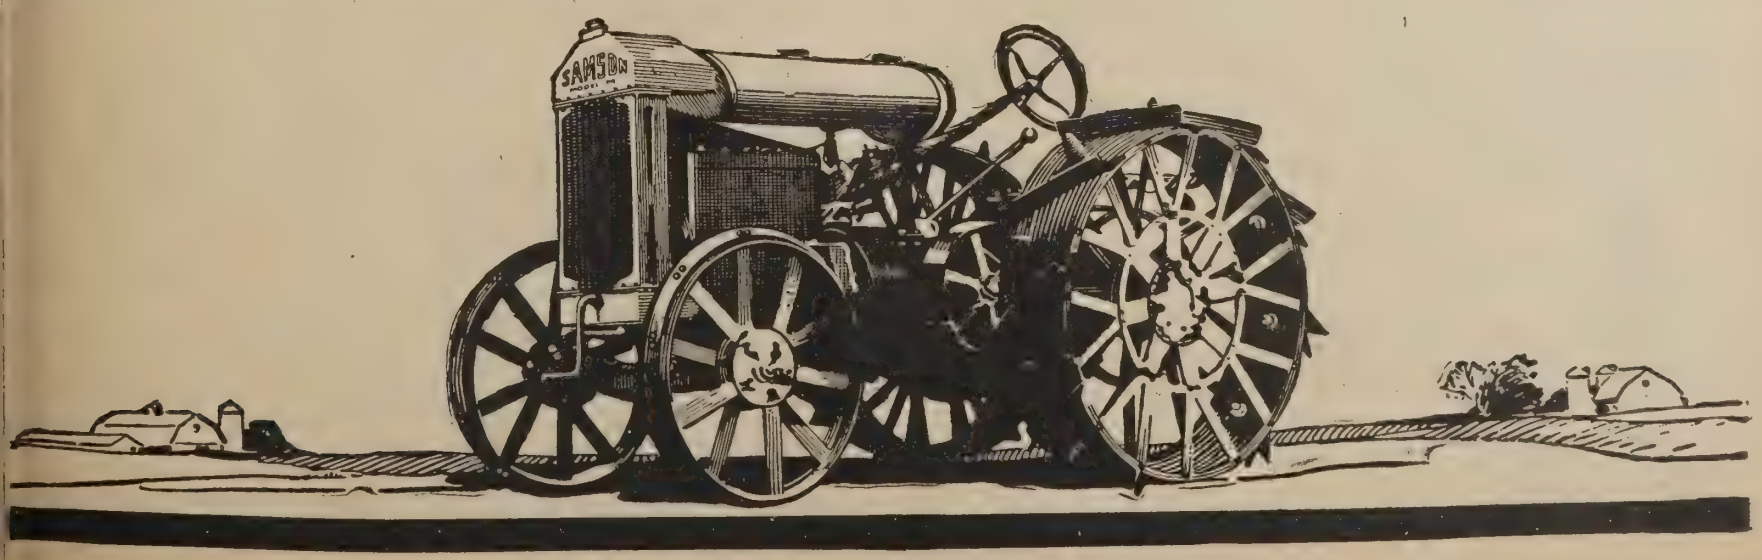
We like to call attention to the fact that the Samson is so simple that the tool it contains three box wrenches—and nothing else.

We like to talk about the safety of the Samson—safety absolutely assured by uniform distribution of weight.

We like to call attention to the fact that you can throw away your oil can—that you don't need it with the Samson because the oil is applied at only two points, and distributed from these points to all moving parts.

We like to talk about the fact that the Samson (Model M) will pull two 14-inch plows at all times—and three 14-inch plows under favorable conditions.

We like to talk about the fact that all moving parts on the Samson are enclosed and self-oiling, waterproof and dustproof. No moving parts exposed except the four wheels.



We like to talk about these things because they help to make the Samson (Model M) the biggest money's worth in the world today.

SAMSON TRACTOR COMPANY, JANESVILLE, WISCONSIN

Kansas Extension Director Appointed Washington Dean

Edward C. Johnson, three yea dean of the division of extension the Kansas State Agricultural C lege, has been appointed Dean of A riculture and Director of the Expe ment Station at the State College Washington.

Mr. Johnson started his work Kansas as superintendent of ins tutes and demonstrations and coun agent leader, in which capacity served the state for three years, un he was made dean of the divisi The corps of extension workers h grown in number from forty-three one hundred forty under his lead ship. The special features that ha been emphasized are the need for versified farming as a permanent s tem of agriculture; the introducti of more live stock into the state; t growing of legume crops; the co struction of silos; and commun building from the standpoint of a round community development. M Johnson's special interests are ag cultural economics and farm mana ment, in addition to his administrati work.

Kansas. JANET LONG.

Illinois Agricultural Meeting Called off

In the interest of public health, t Corn Growers' and Stockmen's co vention or two-week-course in ag culture has been cancelled.

Owing to the widespread pre lence of influenza-pneumonia it s thought inadvisable to hold the ei teenth annual Corn Growers' a Stockmen's convention scheduled meet at the College of Agricultu University of Illinois, January 20 31, 1919. Realizing that a large ga ering of people coming from differ localities might result in spreadi the evils of influenza, the Univers officials and several prominent c zens of the state have decided, af careful consideration, to abandon t convention until next winter.

FRED H. RANKIN, Agr'l Extensi

Farm Fire Don'ts

Fire prevention is quite as imp tant as insurance against loss fr fire, and the state fire marshal Pennsylvania urges farmers to use t same precaution to prevent a fire they would if they expected one t next day. The fire marshal's adv is:

"Don't go to barns or other bui ings with an open light.

"Don't keep gasoline engines gasoline in barns, put them in s arate buildings made of galvani iron, brick, or stone.

"Don't fail to burn rubbish. Do do it near buildings. Watch it wh burning.

"Keep at least six (6) buckets water in passageway of barn. Ma them "For fire purposes only", a see that they are kept filled.

"Keep ladder of sufficient length side of barn for emergencies, a have footholds placed on roof of ba

"Build a cistern near barn with good pump and hose attached.

"Don't neglect to put lightni rods on your building; they prev fire."

To the above suggestions for f prevention and control we would a the purchase of fire extinguishe There are many and various types these, and they are thoroughly pra cal and relatively inexpensive. Th are particularly valuable in contr ing a fire at its start and the one m on the farm can accomplish wonde

You Can Now Get a Pair!

The trenches in Flanders are now empty and it is no longer necessary to keep supplying the boys "over there" with U. S. "Protected" rubber boots.

So, instead of making trench boots almost exclusively as we have been doing, we have reverted to our before-the-war manufacturing program, and will soon make up the shortage that exists in the supply of heavy service, double-duty U. S. "Protected" rubber footwear.

Uncle Sam has furnished "our boys" with the best rubber boots that money can buy, and, in both the Army and Navy, there probably are as many U. S. "Protected" rubber boots as all other brands combined.

Outdoor workers everywhere recognize the dollar-for-dollar value of "U. S." quality. It means rubber boots of the sturdiest construction, reinforced where the wear is greatest, yet entirely comfortable. Longer wear insures saving of money.

Every pair of U. S. "Protected" rubber boots bears the "U. S. Seal"—trade mark of the largest rubber manufacturer in the world. Look for it. It is your protection.

United States Rubber Company
New York

U. S. Rubber Footwear

Cow Waters Herself

and Increases Milk Yield 15% to 20%

That's what happens when the cow has a Libbey Automatic WATER BOWL within reach.

Milk is 87% water and milch cows must have an abundance of water—whenever they want it, day and night—if they are to yield as much milk as they are capable of yielding. Cows that are watered at a trough two or three times a day never drink as much as they need, and the lack of water cuts down the milk supply. This is especially true in the winter, when a supply of water outdoors is so cold that the cows will not drink nearly as much as they need. In many herds, the cows produce only a small quantity of milk because they do not drink enough water.

Every farmer who has installed Libbey Automatic Water Bowls in his stable, and reported accurate comparisons, before and afterward, has proven that they actually increase the milk supply from 15% to 20%. Some cows have shown an increase of as much as 4 pounds of milk per day.

LIBBEY AUTOMATIC WATER BOWLS

The Libbey Bowl is a wonderful improvement over all float tank systems. It is a new invention, having been on the market only three years, but in that time 50,000 Libbey Bowls have been sold.

Each Libbey Bowl is automatic — that is, it controls its own water supply and is operated entirely by the cow.
No float tank is required and bowl operates perfectly under any pressure.
Bowls may be placed at different heights and in any kind of stall or pen.
They cannot overflow and cannot get out of order.
No water is left in bowl to become stagnant or for animal to splash out and wet the stall.
No water can pass from one bowl to another, preventing the spread of contagious diseases.
It is the **only** automatic bowl that has a **dirt strainer protection for its valve,** which absolutely prevents any dirt in the water from hindering operation of valve.

It is the easiest to install, and costs the least of any bowl made.

WHAT THE FARMERS SAY:

11 Cows Gain 40 Pounds of Milk

Robert J. Plenty, Rice Lake, Wisconsin, wrote: "The Libbey Automatic Water Bowls are a money-maker and time and labor-saver. My 11 cows gained 40 pounds of milk in one day, after installing bowls. I would not be without the bowls for a good deal."

Libbey Bowl is Very Superior

Guy D. Power & Son, Pankhurst Farm, Auburn, N. Y., wrote: "The water bowls purchased of you in January are giving good satisfaction watering our herd of 54 milk Ayrshires and Holsteins. The Libbey Automatic Water Bowl is a very superior one and is of valuable aid to dairy farmers in increasing their milk yield."

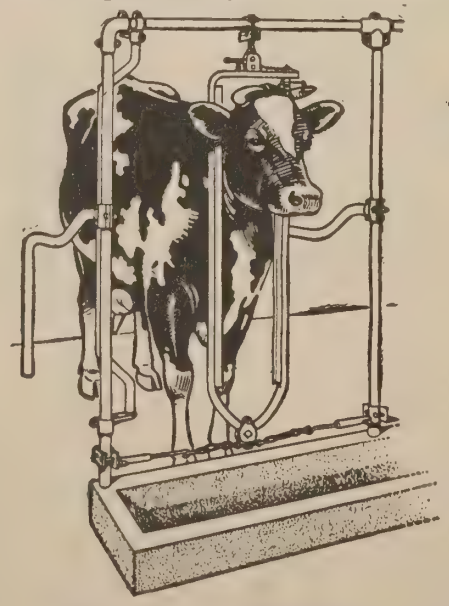
Best He Has Ever Seen.

Alphonse LaBelle, Harris, Michigan, wrote: "I have been using the Libbey Bowls and the Libbey Stanchions for some time, and they are the best that I have seen. The Water bowls keep up the milk yield of the cows and the Stanchions are mighty comfortable on the cow's neck and handy for us to use, so I consider them both good, valuable equipments for any barn, and would not sell them for twice what I paid for them if I could not get more like them."

How the Cow Operates

A little water always remains in bottom of bowl. When the animal is thirsty, it attempts to reach this water and pushes lever to one side, which opens the valve and lets in fresh water about as fast as the animal can drink. When the animal has had enough, it will raise its head, and this lever will swing back to its mid-position in the bowl and the valve will close, shutting off the water.

Mighty Well Pleased With Them



C. S. Shoemaker, Pontiac, Mich., wrote: "The Libbey Automatic Water Bowls which I purchased of you this winter are working splendidly, and I am mighty well pleased with them."

LIBBEY STALLS, STANCHIONS AND CARRIERS

Comfortable cows are contented cows, and the best money-makers. Libbey Stanchions are designed to make cows comfortable.

The Libbey Shock-Absorber is one of our latest improvements. It is a Cushion Spring Stanchion Fastener designed to relieve the cow of jolts, jars, and strains, particularly when getting up and lying down. Dairymen say it is a great feature and you will want to investigate it before you buy your barn equipment.

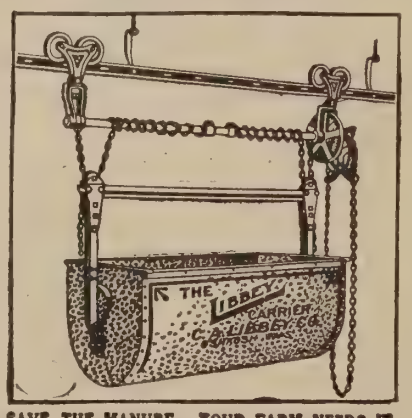
The Libbey line comprises a variety of steel stalls and both steel and wood Stanchions at various prices—from the simplest up to the most improved with all labor-saving attachments.

TRADE MARK LIBBEY

Libbey Litter Carriers are built in four track systems:

Rod or Cable.

Rigid Track.



Rigid Track and Swinging Boom.

Combination Rod and Rigid Track.

Simple and strong. Do not get out of order. Simple locking and tripping device is "always on the job". Tubs dump from either side. Easy to raise and lower. Hoist is powerful and quick-acting—a boy can easily raise a heavy load. Tub may be lowered as fast or slow as desired and stopped at any point.

If interested in Carriers or Sanitary Stanchions or Stalls, ask for General Catalog.

If interested in Water Bowls, ask for Water Bowl Book, also **free Daily Milk and Feed Record.**

SAVE THE MANURE—YOUR FARM NEEDS IT.

Eighty per cent of the fertility in feed consumed by animals is not stored in their bodies, but becomes manure, and should be returned to the soil to produce new crops.

Stable manure is worth too much to neglect or waste. It should be hauled direct to the fields or stored in compact piles, or under a shed. A. Libbey Litter Carrier makes it possible to save all of it, with the least trouble and work.

What About This?

HOARD'S DAIRYMAN:—I have fcre me a report from the Treasu Department, at Washington, setti forth the "estimated consumption a cost of the various articles of fo furnished the army during one ye Among the list of articles are incl ed the following:

Butter, 15,330,000 lbs.; cost $ 516,783.

Oleomargarine, 7,665,000 lbs.; c $2,064,184.50.

In other words, there are just exa ly half as many pounds of oleom garine used as butter. This seem incredible to me at first and set wondering as to the cause of it, a whether our boys were partial to s stitutes for good, wholesome butt I do not recall that there was any ficial order requesting the gene public of the country to cut down the use of butter and use substitut and yet our soldiers, the men ab all others we tried to supply with best food to be had, had no choice to use one-third of butter substitut

Is it possible there was a short of butter? When the dairymen w asked to put their business on a basis there was a gratifying respon Many pounds of milk and butter w produced at a loss to the dairym but the dairyman stuck to his job iantly. When butter and other products began to rise, but it must remembered not in proportion to rise in cost of feeds and most ot articles, many people, hotels, restaurants began using more sub tutes; this cut the demand for but but still the dairyman stuck to job. He had to take what he co get; he could not set a price; he investigated, called a war profit He kept on with a losing proposit for some time, and at no time, d recall, was there any suggestion f the food administration that th was a shortage of butter. The da man saw that there wasn't.

And yet seven and one-half milli of pounds of substitutes are neede year! That is not a very pleas thing for the dairyman to cont plate, while during the beginning the war he was fighting for his istence. Certainly the substitu were neither more easily obtai ble nor more nutritious and sa fying than the real article. Shipp facilities for butter were apparen just as good as for the substitu Our camps were scattered through country so as to make it possible supply each one of them with a ple ful supply of butter.

But, you say, this is all past done. So it is; but it has a fut significance. From all reports, we to have after the war a limited u versal training plan to put into fo Every year we shall have young r training in some of these camps wh have grown out of the war. It be, perhaps, a year yet before m of our troops are demobilized, and seems to me that these men are j as deserving of the best in our lar as when they were on the firing l

Good butter is an article which men want and like and need. dairymen of this country can furn all of it that is needed. There nothing "just as good". I have to meet a soldier who prefers the s stitutes.

Perhaps it is through a lack of fluence in the proper circles tha ration of only two-thirds butter supplied to our men. Certainly it not a fair attitude toward the earn dairyman; but it emphasizes the f that our interests must be represen in all branches of the government that milk and milk products are a cles of food that do not lend the selves to substitutes no matter h skilfully the latter are concocted

Indiana. J. L. JUSTICE

A Campaign to Protect You in Buying Your Watch

RALPH WALDO EMERSON, speaking in one of his essays of a distinguished man, said: "He is put together like a Waltham Watch."

This remarkable tribute to Waltham greatness is the result of the genius of many men whose inventive faculties have been concentrated for nearly three-quarters of a century to make it the wonderful time-keeping device it is.

The buying of a watch is an investment in time-keeping. And time is the most valuable possession of man.

You purchase a watch for one thing—to keep correct time for you—to tell it to you with dependability at any moment of the day or night.

A good watch, therefore, must have something more than good looks—it must have good "works."

Millions of people imagine that the "best" watch is made abroad—or, at any rate, that its works are imported from there.

Yet, in competitive horological tests at the world's great Expositions, Waltham has not only defeated these watches of foreign origin, but all other watches as well.

In a series of advertisements we are going to show Americans that there is a watch built in the United States whose time-keeping mechanism is more trustworthy than those of foreign make,—

A watch that is easily and reasonably repaired because its parts are standardized,—

Duane H. Church, famous inventor who filled the great shops at Waltham, Massachusetts, with exclusive watch-making machinery that performs miracles of accurate and delicate work which the human hand could never equal.

A watch that represents American leadership in mechanical skill,—

A watch that has revolutionized the art of watch making and assured accurate and dependable time-keeping.

We are going to take you through the "works" of a Waltham—lay bare those hidden superiorities which have led the horological experts of the greatest nations to choose Waltham as *the* watch for the use of their government railroads.

When you have finished reading these advertisements, which will appear regularly in the leading magazines, you will walk up to your jeweler's counter and demand the watch you want—because you will know how it is built and why it is superior to the foreign watch.

Look for these advertisements. Read them.

HOLSTEIN SALE

Salt River Valley, Phoenix, Arizona
State Fair Grounds

February 5, 6, and 7th, '19

175 Registered Holsteins
100 Grade Holsteins

SALE FEATURES

Unexcelled Healthy Cattle. Splendid Individuality. Show Ring Winners.
Splendid A. R. O. Records. Cattle Raised in the Open.
Maximum Cows of Milking Age. Pasture Fed 12 Months Each Year.
Cattle Strong in Blood of Pontiac, Korndyke, King Segis, King Segis Pontiac.

THERE WILL BE SOLD

A bull whose three nearest dams average 33.02. A bull whose seven nearest dams average 32.26. Many daughters of the 36-lb. bull, Dichter Spofford Korndyke Lad. Many daughters of the 32-lb. bull, Lieuwkje Korndyke Lad. Many daughters of the bull Roderick Lincoln who has 43 A. R. O. daughters. Numerous daughters of 30-pound sons of King Segis Pontiac. Many A. R. O. Cows.

BEAR IN MIND—***Females from the Bradshaw Herd*** are in calf to a ***Full Brother to King Segis Pontiac Count*** one of the very greatest bulls of this or any age.

Great Buying Opportunity

For Holstein Men

in Southwest, Rocky Mountain States, and Pacific Coast

BECAUSE

Cattle are acclimated.

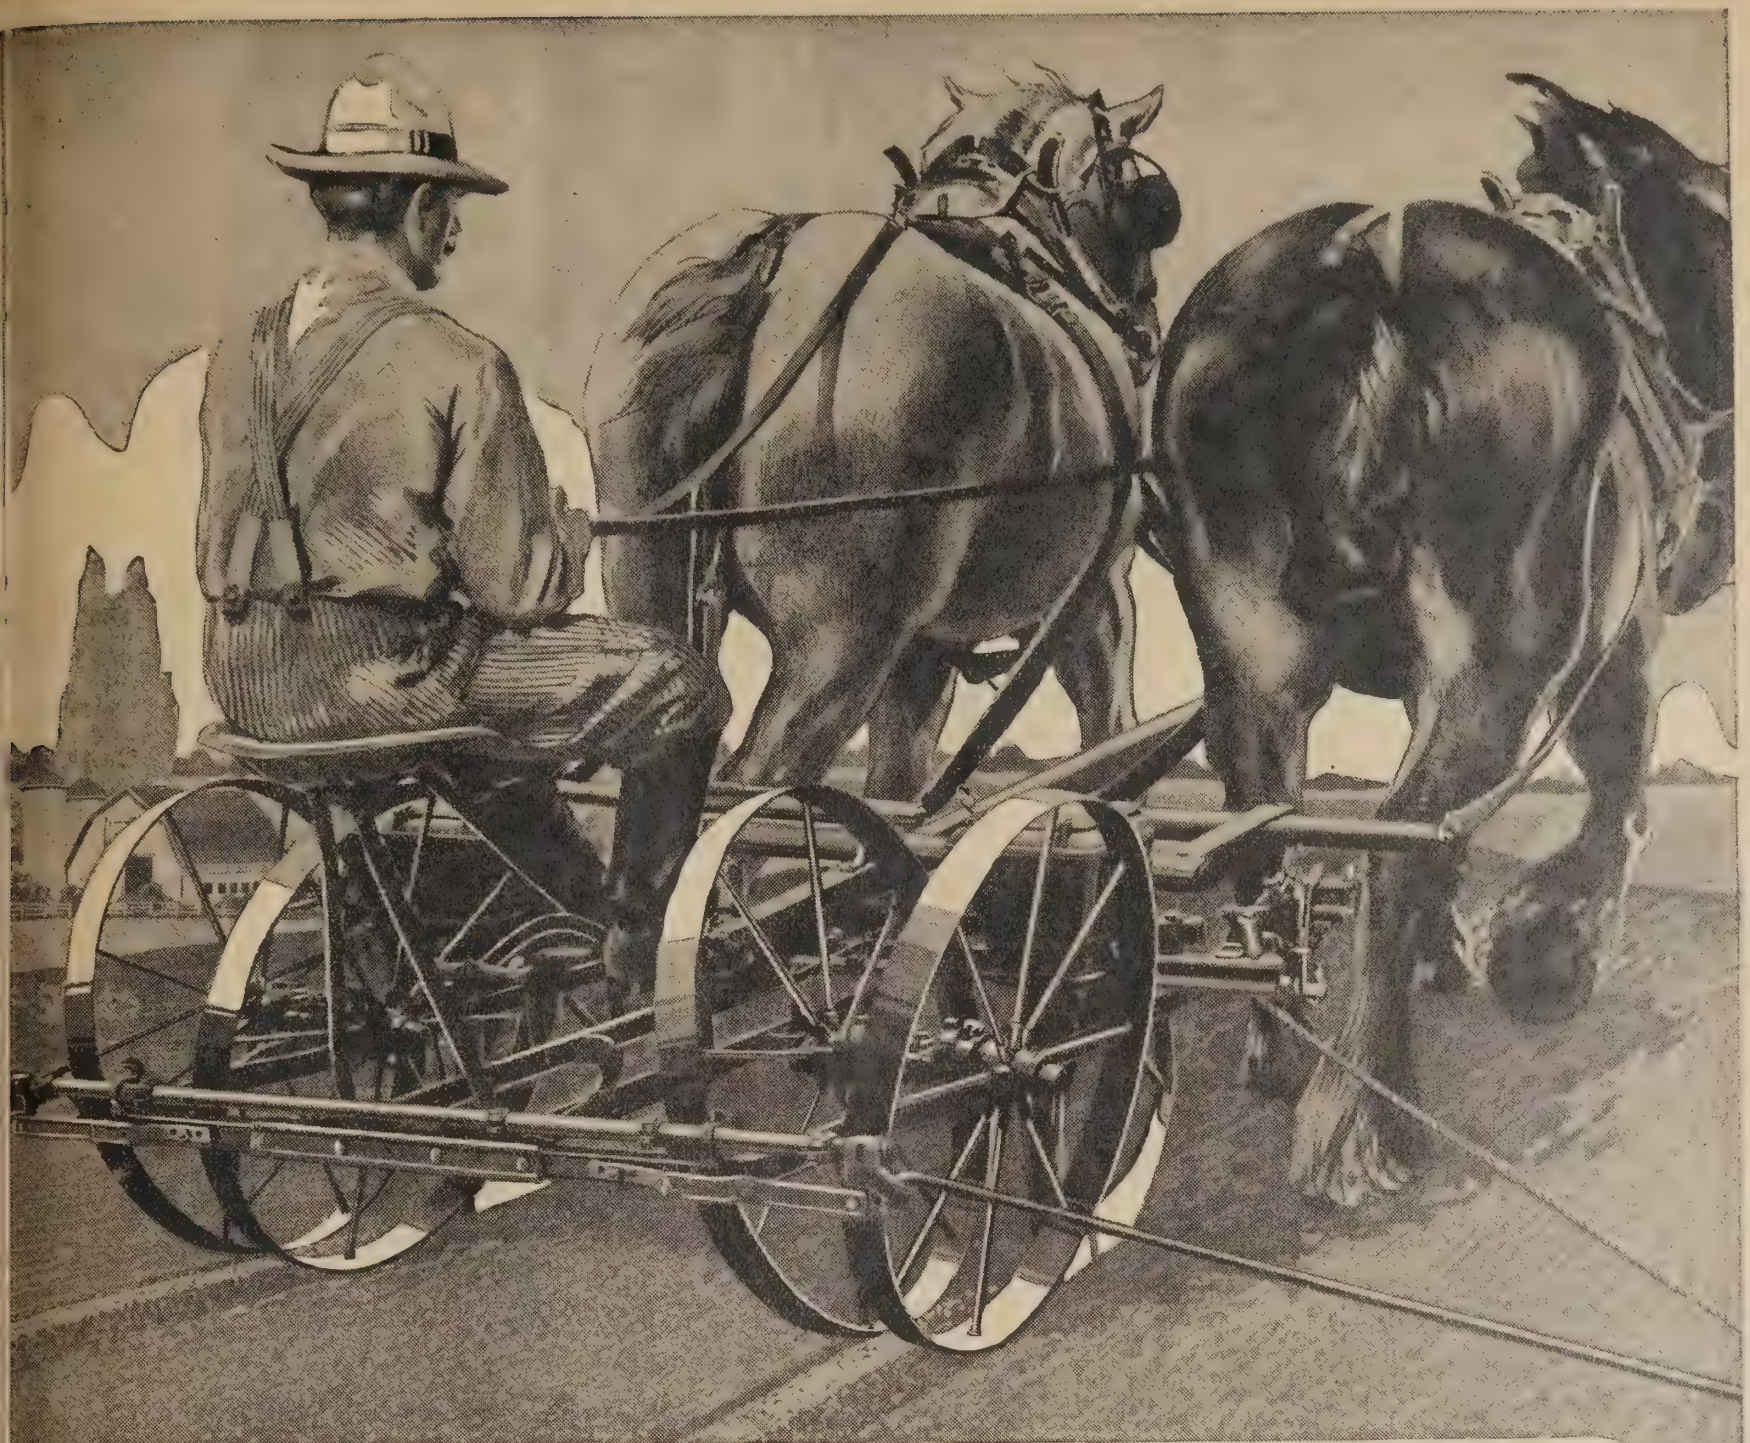
Frontier Mona Korndyke Grand Champion Show Cow. A. R. O. 22.78 butter 7 days, to be sold at this sale.

Splendid Opportunity

For the Big Eastern Breeder

BECAUSE

Cattle prime to make big records. Due to life time in the open. Grass Fed. Extremely well bred.



To breeders everywhere we invite you to come to this great sale. See the green fields in February, bask in Arizona sunshine. Cotton growing has made registered cattle cheaper than anywhere else, and this is your opportunity to buy cattle of the finest breeding, well grown, and heavy producers.

SPECIAL INDUCEMENT: To buyers from other states. Individuals whose purchases exceed 15 head will have freight paid to their shipping point by the sellers.

For illustrated circular and catalogues address sales manager.

Auctioneers: R. E. Haeger, Algonquin, Ill. S. T. Wood, Syracuse, N. Y., Pedigree Expert.

Frank Reed Sanders, Sales Manager, Mesa, Arizona.

Big Yields Prove Hayes Accuracy

FIND the planter that consistently produces the biggest yields per acre and you find the most *accurate* planter. It's the test in the field that counts—that's the only test that means anything to you.

Knowing that "accuracy of drop" is only one of 7 necessary preventatives of "bare spots", the insidious pests that rob American farmers of millions of bushels every year, we make no special demonstrations of Hayes accuracy. We point to its unmatchable record as "champion of mighty yields for over 30 years".

HAYES Four-Wheel PLANTER

"Plants Like Human Hands"

For a maximum yield you must overcome *all* 7 causes of "bare spots". These are (1) Seed planted too deep! (2) Seed planted too shallow! (3) Seed left uncovered! (4) Seed killed in the hopper! (5) Hills missed by the drop! (6) Hills "washed out!" (7) Hills destroyed in cultivation!

"Accuracy of drop," no matter how faultless, cannot alone assure a maximum yield. There are six other menaces to overcome; and over 200,000 American corn growers know that the Hayes Four Wheel System of Human Hand Planting is the only system in the world that will positively and unfailingly overcome them all.

Due to fourwheel principle the Hayes plants to an even depth. The runners set back between the wheels close to the covering point. Shoe rises and falls with the wheels, planting each kernel the exact depth on level or most uneven ground. Dangers (1) and (2) are thus eliminated.

Due to the fourwheel construction the Hayes *covers where all others fail.* The wheels "gather" the earth over the corn like a pair of hands, packing it down firmly so "wash outs" will not occur. Thus dangers (3) and (6) are overcome.

The Hayes "Never-Fail" Drop positively *never misses a hill.* It will drop all sizes and shapes of kernels accurately, including "Butts and tips". Has no clutch to slip, wear and give trouble. Has fewer parts than any other and positively will not cut or grind the seed. Thus dangers (4) and (5) are eliminated.

It is often remarked that the Hayes "checks straighter than the way you drive", regardless of the team's speed. This means accurate cultivation with no chance of "dug up" hills. Thus menace (7) is eliminated.

This is the planting service today responsible for mighty yields on thousands of farms. It is the safest big crop insurance you can buy. Add to this the fact that many Hayes Four Wheel Planters give 18, 20 and 25 years of service with practically no repair expense and you have the reason why this planter is being selected by thousands of new users each year.

Go to the Local Hayes Dealer

See the Hayes. Investigate its record. Insure your 1919 crop against "bare spots" by using the Hayes Human Hand System. Also write for our Million Dollar Corn Planter Book—the most amazing book on corn planting ever written. No farmer who grows corn should fail to read it. Mail a postal and we will send a copy free.

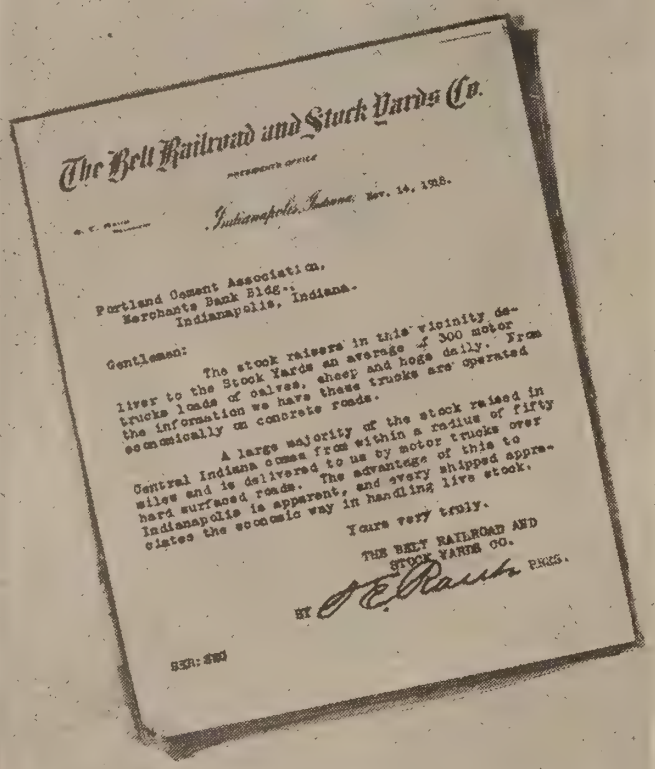
Concrete Roads and Roast Beef

THIS load of roast beef, live stock from farms in the vicinity of Indianapolis, Ind., is on its way over one of the **concrete roads** of Marion County to the Indianapolis stockyards.

Before the combination of motor trucks and **concrete roads** existed in Marion County, farmers in the vicinity of Indianapolis had to sell live stock to dealers, who bought enough cattle in the neighborhood to make a carload for shipment to Indianapolis.

What the **concrete roads** leading to Indianapolis have done for stock raisers is best told by Joseph Jackson, one of the prominent farmers of Lebanon, Indiana.



Read What He Says:

"During the past few months **concrete roads** have enabled me to ship live stock direct to the yards by motor truck, eliminating the middle man and saving me his profit.

"It also saves shrinkage in weight of the cattle, caused by loading, shipping and unloading from freight cars, and I can ship as often as I have stock ready for the market, without waiting to get together a carload: which often makes it necessary to include animals still under full weight.

"Shipping by truck would be expensive over poor roads and often impossible. Over concrete you can keep your trucks going the year round, with the least wear and tear and with a minimum of gasoline.

"**Concrete roads** and motor trucks are and will be hereafter a great aid to the farmer shipping produce and live stock to market."

The Belt Railroad and Stock Yards Co.

Indianapolis, Indiana, Nov. 14, 1918.

Portland Cement Association,
Merchants Bank Bldg.,
Indianapolis, Indiana.

Gentlemen:

The stock raisers in this vicinity deliver to the Stock Yards an average of 300 motor trucks loads of calves, sheep and hogs daily. From the information we have these trucks are operated economically on concrete roads.

A large majority of the stock raised in Central Indiana comes from within a radius of fifty miles and is delivered to us by motor trucks over hard surfaced roads. The advantage of this to Indianapolis is apparent, and every shipper appreciates the economic way in handling live stock.

Yours very truly,

THE BELT RAILROAD AND STOCK YARDS CO.

BY S. E. Rauh PRES.

S. E. Rauh, President of the Belt Railroad & Stockyards Co., Indianapolis, also has something to say about shipment of live stock by motor truck into Indianapolis. ***Read his letter, too.***

You see that roast beef may depend on concrete roads, that roads are a great factor in regular distribution of food products.

Read again the second paragraph of Mr. Jackson's letter above. It gives some of the reasons why

A SON OF KING OF THE PONTIACS

The World's Greatest Proven Sire

For $350

This is half his value—but his color is against him, as he is nearly all black. He was born in August, is a splendid individual, and is out of a 19-lb. 3-yr.-old. Don't miss this chance of a life time.

Geoffrey G. Burlingame, Cazenovia, N. Y.

$300.00

Buys a Son of the Great Sir Veeman Hengerveld

Bull calf born Oct. 20, 1918, a large growthy fellow, and a fine individual.

Sire:—Sir Veeman Hengerveld, the latest century sire, and the only living sire with sixteen 30-lb. daughters. His daughters average the highest for butter and third highest for milk of any sire having 60 or more A. R. O. daughters.

Dam—Blanche DeKol Segis, a granddaughter of King Segis, and has the following A. R. O. record: Butter, 7 days, 28.48; 30 days, 109.86. Milk, 7 days, 617.9; 30 days, 2,604.

This young bull is offered at less than half his value, on account of his being dark in color.

W. D. ROBENS, POLAND, NEW YORK.

Owing to Long Continued Illness—

I have decided to sell immediately part or all of the Lakeside Herd, including heifer calves, yearling heifers, bred heifers, cows and bulls of various ages, several of them from dams with records of 30 to 35 lbs. butter in a week. A rare chance for parties who wish to breed a high class, embracing individuality, breeding and production. E. A. POWELL,

904 W. Genesee St., Syracuse, New York.

SECOND

ANNUAL SALE

Evansville, Wisconsin

(Two blocks from the depot.)

January 29th, 1919

85 REGISTERED HOLSTEINS 85

Sold Under 60-Day Retest Guarantee

A Quality Sale

Eight of the cows listed are bred to a 42-lb. bull.

A still larger number are in calf to a 35-lb. sire.

Many more are bred to such bulls as Finderne Pride Johanna Korndyke, a son of the highest living yearly butter cow—Finderne Pride Johanna Rue.

Many of the cows listed have creditable A. R. O. records as high as 31.82 lbs. The cow holding this record is in calf to a 35-lb. bull and is insured in the Hartford Life for $1,000.00.

Young Bulls Listed

A 30.32-lb. son of Diamo Pontiac Korndyke through whom he traces to Fairview Korndyke Mata, 47.11 lbs., and Korndyke Wiona, 42.16 lbs.

Sir Pontiac Artis Gelsche, out of a 20.22-lb. Jr. 2-yr.-old daughter of a 30-lb. cow; and a grandson of King of the Black and Whites.

Two sons of Finderne Pride Johanna Korndyke. Their dams will soon be tested in Cabana's herd.

Also a splendid young son of King Model.

Granddaughters Listed

There are granddaughters of Pontiac Korndyke, King of the Pontiacs, Spring Farm King Pontiac, King Segis Pontiac, King of the Black and Whites, King Segis DeKol Korndyke, Admiral Walker Prilly, King Segis Pontiac Alcartra, and Aaggie Cornucopia Johanna Lad.

Don't only plan to attend the sale but come prepared to be present at the big banquet at the Central Hotel the evening of the sale. Good speakers have been selected and a good time is assured.

F. B. Green, Sec'y and Sale Manager, Evansville, Wis.

30-Lb. Cows—30-Lb. Bulls

Michigan Agricultural College East Lansing, Michigan

Thursday Forenoon, February 6th, '19

40 Head of Extras At Auction

From Central Michigan Breeders Including

A 32-lb. cow, a 31-lb. cow, a 27.3-lb. cow, her daughter and granddaughter, a 25.6-lb. cow and her 22-lb. and 26.95-lb. daughters. A 25-lb. jr. 3-yr.-old and a 20-lb. two-yr.-old and her daughter, a daughter of a 30-lb. cow, 4 daughters of 25-lb. cows, a daughter of a 21-lb. 2-yr.-old and others with good records. Several yet to be tested before the sale. The most of these records were made by inexperienced men. These cows are bred to bulls from cows up to 35 lbs. There are 39 females of which 32 are cows.

Two bulls—One from a 29.91 jr. 4-yr. granddaughter of Sir Korndyke Pontiac Artis sired by a 32-lb. son of King Segis Pontiac Alcartra. This bull's dam looks like a sure 30-pound cow at maturity. The other is from a cow now on test with 31.53 lbs. butter from 734.0 lbs. milk in seven days. She will be run 30 days and make very nearly 3,000 lbs. milk. He is sired by a bull from a 32-lb. son of King Segis Pontiac Alcartra out of a 31-lb. daughter of a 31-lb. cow.

All are positively guaranteed and sold subject to 60-day retest. Watch this space next week. For catalog address

How About a Herd Sire?

MUTUAL FOBES LONGFIELD DEKOL 82959
A Splendid Son of His For Sale.

The Calf—M. M. Tritomia Fobes Longfield was born Feb. 2, 1918. He is nearly white, as straight as a line, and very well grown.

His Sire—Mutual Fobes Longfield DeKol already has 22 A. R. O. daughters and a large number of younger ones coming on that will be retained in our herd. His sire is one of the good sons of Mooie Mutual DeKol and his dam, a daughter of Homestead Jr. DeKol, made 30.04 lbs. butter, 630.80 lbs. milk in 7 days as a jr. 3-yr.-old; 124.42 lbs. butter and 2,651.60 lbs. milk in 30 days. (World's record when made).

The Dam, Milford Tritomia Fobes Homestead, a daughter of Canary Fobes Bessie Homestead, made 17.35 lbs. butter, 358.2 lbs. milk as a jr. 3-yr.-old; the second dam 17.38 lbs. butter, 408.3 lbs. milk; third dam 22.19 lbs. butter, 488.40 lbs. milk.

This is an excellent combination of breeding, the sire of this youngster and his dam's sire both being from daughters of Homestead Jr. DeKol, both with records above 30 lbs. butter and 600 lbs. milk.

The calf is priced within reach of any small breeder. Write us today for complete information about him.

JOHN HETTS, FORT ATKINSON, WIS.

FOR SALE—REGISTERED HOLSTEIN BULL

We still have one dark colored bull about eleven months old, well grown and a splendid individual, show ring type. His two nearest dams average 25 lbs. of butter for seven days, and 700 lbs. for the year, one of them as a two-yr.-old who gave 16,000, lbs. of milk in a year. They will be tested again at their next freshening and we feel very sure that both dams will make at least 30 lbs. He is sired by a grandson of the great King of the Black And Whites. Will make a great bull for somebody. Price $250.00—decidedly reasonable quality, breeding and records considered. Address:

Elm Leaf Stock Farm, Bear Creek, Wisconsin.
James McKone, Proprietor, William Lucia, Mgr.

Registered Holstein Cows, Heifers and Calves For Sale

OUR herd is reaching such proportions that we find it necessary to offer for sale at this time thirty-five or more cows, heifers and calves.

This is a strictly high-class offering and not a "cull" sale. Among them are cows with records from 20 to 25 lbs. and heifers from high producing dams.

Every animal is guaranteed sound in every respect. Will furnish Federal certificate of health and if purchaser desires we will sell subject to sixty-day retest.

Come up and see us if possible. We will be glad to give you particulars by mail but this is not as satisfactory for either party.

The E. C. Schroeder Farms,
Moorhead, Minn.

To Avoid Inbreeding We Offer For Sale Our Senior Herd Sire.

AAGGIE PONTIAC GRAHAMHOLM LAD
160480. Born Jan. 11th, 1915.
A SHOW BULL That Will Look Mighty Good in Any State Fair Ring.
Sire. Aaggie Cornucopia Johanna Lad Jr., 56 A. R. O. daughters.
Dam. Arcady Pontiac Pietertje Beets. Butter, 7 days, 28.53 lbs. Butter, 365 days, 683.8 lbs.
We are raising all his daughters, none are for sale—and we will officially test them as fast as they freshen. Fine, straight individuals, all of them—no sloping rumps—and all show uniform good udder development.
He is a quick, sure breeder and a gentle bull to handle. Weight 2,200 lbs. Buy him and you will soon have a sire with a number of A. R. O. daughters, and a show bull as well.
Send for extended pedigree and full particulars. **ELMWOOD FARM HERD, U. L. Lashbrook & Son, Northfield, Minn.**

Frank White & Son Will Sell Their

GROVELAND HERD

of Registered Holsteins

Tuesday, January 28th, 1919

At Woodstock, Illinois

This Is An Absolute Dispersion

60 Holsteins to Be Sold

Including 20 cows of milking age all but two of them with creditable A. R. O. records up to 28.45 in 7 days. This includes a daughter of Tidy Abbekerk Prince, 2 daughters of Spring Farm King Pontiac 5th, now on semi-official test, a 21-lb. granddaughter of King of the Pontiacs from a sister to Belle Model Johanna 2nd, and others equally well bred.

Most of these cows are bred to a 28.45-lb. son of King Korndyke Hengerveld Ormsby or to a son of King of the Pontiacs. Some will be fresh at time of sale and others heavy springers.

14 daughters of King Pontiac Maplecroft (see below), 7 of them splendid 2-yr.-olds safe in calf to Groveland Ormsby Korndyke—due to freshen this spring—7 short yearling heifers. 3 two-year-old daughters of Groveland Pontiac Segis, he a grandson of King of the Pontiacs.

Bulls: A 3-year-old Son of King of the Pontiacs

His dam—Princess Maplecroft Pauline made 26.04 lbs. butter and 613.9 lbs. of milk in 7 days. This bull is one that would show well in any ring and his 14 daughters, to be sold, prove him a sire of excellent individuals.

Groveland Ormsby Korndyke, a 28.45-lb 2-year-old son of King Hengerveld Ormsby (51 A. R. O. daughters), he a son of Sir Korndyke Hengerveld De Kol and Pietertje Maid Ormsby.

6 young bulls, 3 of them ready for service. All from A. R. O. dams—one of them by Groveland Pontiac Segis and from Lady Ona Kejlaard, an A. R. O. cow that was for years a consistent show ring winner.

Every animal to be tested by state approved Veterinarian.

Write today for your catalogue.

Haeger & Mack, Auctioneers.

FRANK WHITE & SON, WOODSTOCK, ILL.

Remember: Our cattle have not only proven themselves as producers but in the show ring as well.
